PETITION FOR A WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

Petitioners Continental Oil Company and Midhurst Oil Corporation respectfully pray that a Writ of Certiorari issue to review the judgment and opinion of the United States Court of Appeals for the Tenth Circuit entered on January 20, 1967, in *Skelly Oil Company, et al., Petitioners,* v. *Federal Power Commission, Respondent* (10th Circuit Nos. 8385, *et al.*), affirming in part Opinion Nos. 468 and 468-A of Respondent Federal Power Commission, issued in the Permian Basin Area Rate Proceeding, FPC Docket AR61-1, *et al.*

OPINIONS BELOW

The opinion of the Court of Appeals for the Tenth Circuit which is not yet reported is printed as Appendix A hereto. Opinion Nos. 468 and 468-A and accompanying

modifying and amending orders of the Federal Power Commission (R. 516d-826d, 1105d-1132d, 1154d-1155d, 1156d-1157d) are reported at 34 FPC 159, 34 FPC 1068, 34 FPC 1198 and 34 FPC 1286. The judgment of the Court of Appeals is printed as Appendix B.

JURISDICTION

The opinion and judgment of the Court of Appeals were entered on January 20, 1967. This petition is timely filed and the jurisdiction of this Court is invoked under 28 USC § 2101 and Rule 19 of the Rules of this Court.

QUESTIONS PRESENTED

1. Whether the regulatory method adopted by the Federal Power Commission for area rate regulation of independent producers must be compatible with the basic characteristics of the gas producing industry.

2. Whether the Commission can lawfully and equitably impose a regulatory method for determining area rates for independent producers which employs a dual system of pricing providing different prices for identical gas based merely on the time at which gas sales contracts were executed, and the kind of well from which the gas is produced.

3. Whether the Commission can lawfully and equitably adopt a regulatory method for determining independent producer area rates which is almost exclusively based upon utilization of composite *average* industry costs to determine industry revenue requirements and *ceiling* prices.

4. Whether the Commission can lawfully and equitably require producers in the Permian Basin Area to refund

amounts collected in excess of the area ceiling rates under given contracts, without permitting the producers as a group to balance revenues under those contracts affording above area ceiling rates with the deficiencies in revenues under contracts providing below area ceiling rates in order to determine as a prerequisite of any refunds whether there is an overall deficiency in group revenues under all contracts compared to the group costs upon which area ceiling rates are based.

5. Whether the Commission can lawfully and equitably impose a moratorium on rate increases and filings above the ceilings until January 1, 1968.

6. Whether the Court of Appeals can decline to exercise its review function under § 19(b) of the Natural Gas Act [15 USC § 717r(b)] by expressly refusing to consider in any way the Commission's cost method of determining area cost and rates, including selection and adequacy of data sources, methods of cost allocations and the cost results.

7. Whether the Commission could lawfully and equitably establish the rates determined in the face of the overwhelming preponderance of the economic evidence proving the need for higher rates.

STATUTES INVOLVED

The Natural Gas Act, 52 Stat. 821 *ff.*, 15 USC § 717-717w, provides in pertinent part:

RATES AND CHARGES; SCHEDULES; SUSPENSION OF NEW RATES

SEC. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connec-

PETITION FOR A WRIT OF CERTIORARI

tion with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b) No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c) Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services.

(d) Unless the Commission otherwise orders, no change shall be made by any natural-gas company in any such rate, charge, classification, or service, or in any rule, regulations, or contract relating thereto, except after thirty days' notice to the Commission and to the public. Such notice shall be given by filing with the Commission and keeping open for public inspection new schedules stating plainly the change

or changes to be made in the schedule or schedules then in force and the time when the change or changes will go into effect. The Commission, for good cause shown, may allow changes to take effect without requiring the thirty days' notice herein provided for by an order specifying the changes so to be made and the time when they shall take effect and the manner in which they shall be filed and published.

(e) Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, State commission, or gas distributing company or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time it would otherwise go into effect; and after full hearings, either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natural-gas company to furnish a bond,

to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and, upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas company, and the Commission shall give to the hearing and decision of such questions preference over other questions pending before it and decide the same as speedily as possible. [52 Stat. 822 (1938); 76 Stat. 72 (1962); 15 U.S.C. § 717c]

FIXING RATE AND CHARGES; DETERMINATION OF COST OF PRODUCTION OR TRANSPORTATION

SEC. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,* That the Commission shall have no power to order any increase in any rate contained in the currently

the Commission, unless such increase is in accordance with a new schedule filed by such natural-gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise ineffective schedule of such natural-gas company on file with lawful, or are not the lowest reasonable rates.

(b) The Commission upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas. [52 Stat. 823 (1938); 15 U. S. C. § 717d].

EXTENSION OF FACILITIES; ABANDONMENT OF SERVICE

SEC. 7. (a) Whenever the Commission, after notice and opportunity for hearing, finds such action necessary or desirable in the public interest, it may by order direct a natural-gas company to extend or improve its transportation facilities, to establish physical connection of its transportation facilities with the facilities of, and sell natural gas to, any person or municipality engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public, and for such purpose to extend its transportation facilities to communities immediately adjacent to such facilities or to territory served by such natural-gas company, if the Commission finds that no undue burden will be placed upon such natural-gas company thereby: *Provided,* That the Commission shall have no authority to compel the enlargement of transportation facilities for such purposes, or to compel such natural-gas company to establish physical connection or sell natural gas

when to do so would impair its ability to render adequate service to its customers. [52 Stat. 824 (1938); 15 U. S. C. § 717f (a)]

(b) No natural-gas company shall abandon all or any portion of its facilities subject to the jurisdiction of the Commission, or any service rendered by means of such facilities, without the permission and approval of the Commission first had and obtained, after due hearing, and a finding by the Commission that the available supply of natural gas is depleted to the extent that the continuance of service is unwarranted, or that the present or future public convenience or necessity permit such abandonment. [52 Stat. 824 (1938); 15 U. S. C. § 717f (b)]

(c) No natural-gas company or person which will be a natural-gas company upon completion of any proposed construction or extension shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission, or undertake the construction or extension of any facilities therefor, or acquire or operate any such facilities or extensions thereof, unless there is in force with respect to such natural-gas company a certificate of public convenience and necessity issued by the Commission authorizing such acts or operations: *Provided, however,* That if any such natural-gas company or predecessor in interest was bona fide engaged in transportation or sale of natural gas, subject to the jurisdiction of the Commission, on the effective date of this amendatory Act, over the route or routes or within the area for which application is made and has so operated since that time, the Commission shall issue such certificate without requiring further proof that public convenience and necessity will be served by such operation, and without further proceedings, if application for such certificate is made to the Commission within ninety days after the effective date of this amendatory Act. Pend-

ing the determination of any such application, the continuance of such operation shall be lawful.

In all other cases the Commission shall set the matter for hearing and shall give such reasonable notice of the hearing thereon to all interested persons as in its judgment may be necessary under rules and regulations to be prescribed by the Commission; and the application shall be decided in accordance with the procedure provided in subsection (e) of this section and such certificate shall be issued or denied accordingly: *Provided, however,* That the Commission may issue a temporary certificate in cases of emergency, to assure maintenance of adequate service or to serve particular customers, without notice or hearing pending the determination of an application for a certificate, and may by regulation exempt from the requirements of this section temporary acts or operations for which the issuance of a certificate will not be required in the public interest. [52 Stat. 825 (1938), as amended, 56 Stat. 83 (1942); 15 U. S. C. § 717f (c)]

(d) Application for certificates shall be made in writing to the Commission, be verified under oath, and shall be in such form, contain such information, and notice thereof shall be served upon such interested parties and in such manner as the Commission shall, by regulation, require. [56 Stat. 84 (1942); 15 U. S. C. § 717f (d)]

(e) Except in the cases governed by the provisos contained in subsection (c) of this section, a certificate shall be issued to any qualified applicant therefor, authorizing the whole or any part of the operation, sale, service, construction, extension, or acquisition covered by the application, if it is found that the applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Act and the require-

ments, rules, and regulations of the Commission thereunder, and that the proposed service, sale, operation, construction, extension, or acquisition, to the extent authorized by the certificate is or will be required by the present or future public convenience and necessity; otherwise such application shall be denied. The Commissson shall have the power to attach to the issuance of the certificate and to the exercise of the rights granted thereunder such reasonable terms and conditions as the public convenience and necessity may require. [56 Stat. 84 (1942); 15 U. S. C. § 717f (e)]

(f) The Commission, after a hearing had upon its own motion or upon application, may determine the service area to which each authorization under this section is to be limited. Within such service area as determined by the Commission a natural-gas company may enlarge or extend its facilities for the purpose of supplying increased market demands in such service area without further authorization. [56 Stat. 84 (1942); 15 U. S. C. § 717f (f)]

(g) Nothing contained in this section shall be construed as a limitation upon the power of the Commission to grant certificates of public convenience and necessity for service of an area already being served by another natural-gas company. [56 Stat. 84 (1942); 15 U. S. C. § 717f (g)]

(h) When any holder of a certificate of public convenience and necessity cannot acquire by contract, or is unable to agree with the owner of property to the compensation to be paid for, the necessary right-of-way to construct, operate, and maintain a pipe line or pipe lines for the transportation of natural gas, and the necessary land or other property, in addition to right-of-way, for the location of compressor stations, pressure apparatus, or other stations or equipment necessary to the proper operation of such pipe line or pipe lines, it may acquire the same by the

exercise of the right of eminent domain in the district court of the United States for the district in which such property may be located, or in the State courts. The practice and procedure in any action or proceeding for that purpose in the district court of the United States shall conform as nearly as may be with the practice and procedure in similar action or proceeding in the courts of the State where the property is situated: *Provided,* That the United States district courts shall only have jurisdiction of cases when the amount claimed by the owner of the property to be condemned exceeds $3,000. [61 Stat. 459 (1947); 15 U. S. C. § 717f (h)]

STATEMENT

In *Wisconsin* v. *Federal Power Commission,* 373 U.S. 294 (1963), this Court was confronted with the advent of the Commission's area ratemaking approach to producer regulation. This Court there acknowledged at 373 U.S. 309-310 the avowed purpose of producer area rate regulation:

> ". . . The Commission has stated in its opinion in this proceeding [the remanded Phillips 5(a) proceeding there before the Court] that the goal [of the area rate method] is to have rates based on the 'reasonable financial requirements of the industry' in each production area, 24 FPC at 547 . . .
>
> ". . . We share the Commission's hopes that the area approach may prove to be the ultimate solution."

This is the case in which this Court is first asked to decide whether those hopes have been realized.

The area involved is the Permian Basin Area located in West Texas and Southeastern New Mexico, comprising

one of the largest and most important natural gas producing areas in the nation.

Petitioners are independent producers of natural gas engaged in sales of natural gas subject to Commission jurisdiction under the Natural Gas Act in fields in the Permian Basin Area, and were respondents in the Permian Basin Area Rate Proceeding. In this first area rate proceeding, the Commission issued Opinion 468 and implementing orders on August 5, 1965, and thereafter by Opinion 468-A issued October 4, 1965, denied rehearing sought by these Petitioners and others.

The Commission held that regulation of independent producers under the Natural Gas Act should be on an area basis; and purported to determine just and reasonable rates within the area for all producers. In so doing, the Commission established two ceiling rates, one for "new" gas well gas and one for all other gas denominated "flowing gas" or "old gas". The 16.5¢ per Mcf ceiling for new gas well gas was based upon a current cost computation utilizing data from various statistical sources. The 14.5¢ ceiling for flowing gas was based upon a historical (1960 test year) rate base cost of service computation employing cost and revenue data obtained from questionnaires from selected producers. New gas well gas was defined as all gas well gas committed to contract January 1, 1961 or later and all residue gas after processing such gas well gas. Flowing gas was defined as all other gas, meaning all oil well gas (casinghead gas), all gas well gas committed to contract prior to January 1, 1961, and all residue gas after processing of either.

The separately established rates for new and old gas and for types of gas were made applicable only to gas conforming to certain "pipeline quality" specifications. These quality standards related to Btu heating value, pressure and content of other substances such as water, hydrogen

sulphide, sulphur and carbon dioxide commonly found in natural gas.

From the applicable ceiling rates, downward adjustments were provided for any gas which did not conform to the quality standards specified by the Commission. Most gas in the Permian Basin is below pipeline quality as specified. In the case of Btu content, a proportional downward adjustment for gas below 1,000 Btu per cubic foot and upward adjustment for gas above 1,050 Btu per cubic foot was ordered. The "applicable area rate" for each sale of gas in the Permian Basin Area was defined to be the ceiling or base area rate, with reference to the date of contract and type of gas, as adjusted for quality deviations from the Commission-prescribed standards.

The Commission also ordered a 2½ year moratorium against filing for any rate increases above the applicable area rate.

Refunds of amounts collected prior to the effective date of the Commission's opinion in excess of the applicable area rates where the excess had been suspended under Section 4 of the Act, plus interest, were ordered.

Petitioners and other producers duly filed timely petitions for review of Opinion 468 and Opinion 468-A before the United States Court of Appeals for the Tenth Circuit. The Court of Appeals issued its decision below on January 20, 1967, in the cases before it seeking review of the Commission's Permian Basin area rate decision. While the Tenth Circuit affirmed the basic regulatory method employed by the Commission in determining and regulating area rates, it remanded certain matters to the Commission for further proceedings. The main defect the court below found in the Commission's opinion related to the regulatory standard employed by the Commission. The

Commission held there was a "fair relationship" between the consumer costs of Permian Basin gas at the rates established and the "revenue requirements" of the producers. According to the court below, it was error to depart from the "end result" test or standard first enunciated in *Federal Power Commission* v. *Hope Natural Gas Company,* 320 U.S. 591 (1944), whereby it can be demonstrated that established rates will return to the regulated producer its revenue requirements or costs. In this case the Commission could not employ the end result test because there was in the record no evidence on the extent of quality deviations or the cost of correcting them. Therefore, since neither the producers' whole cost nor actual revenues could be determined, the end result test could not be made.

While Petitioners do not object to the regulation of producer rates on an area basis *per se,* Petitioners do vigorously object to the affirmance by the court below of the methods employed by the Commission in determining and regulating area rates, and the rates established, in the following particulars: (1) approval of the Commission's refusal to relate the regulatory method to the basic characteristics of the industry; (2) approval of the dual pricing system; (3) approval of the Commission's determination of area rates for independent producers on the basis of selective composite industry computed average costs; (4) approval of the Commission's refund order without regard to industry or individual producer revenue deficiencies; (5) approval of the imposition of a moratorium on rate increases; (6) the abandonment by the court below of its review function by refusing to consider the cost evidence and costing methods employed in determining the area rates; (7) the approval in principle of the rate levels established. In these and other essential respects the Court of Appeals rejected Petitioners' contentions that the Commis-

sion's regulatory method must conform to the essential economic characteristics of the natural gas producing industry and must perform the regulatory objectives of assuring a continuing adequate supply of gas at just and reasonable rates.

REASONS FOR GRANTING THE WRIT

The opinion of the court below presents substantial, novel and important questions of first impression as to the proper basis for regulation of independent producers under the Natural Gas Act. These are stated in the foregoing "Questions Presented" and given focus in the foregoing "Statement". At the root, this Court must decide the fundamental question of whether producer rate regulation is to be limited to narrow utility type cost of service computations or whether the method of producer rate regulation should comport with the basic characteristics of the industry which is to be regulated.

While recognizing that cost based regulation is contrary to the economic facts of the industry (Appendix p. 48a), the court below has brushed aside without adequate basis Petitioners' arguments that the Commission's entire regulatory method is ill-suited and unworkable when applied to producers even if it is a suitable method for regulating public utilities. The opinion of the court below does not show how the basic requirement of sound regulation — that a regulatory method must be suited to the characteristics of the industry to be regulated — has been met by the method employed in Opinion Nos. 468 and 468-A. See *Wisconsin* v. *Federal Power Commission*, 373 U.S. 294, 308-310 (1963). The remand below did not cure the pervading defect of the Commission's regulatory approach which would fetter the gas producing industry with a wholly ill-fitted mode of regulation not framed or appropriate to effectuate the basic regulatory purpose under the Natural

Gas Act of assuring consumers an adequate supply of gas at just and reasonable prices.

The court below did not assign as error the Commission's unsupported findings or failure to make necessary findings respecting competition, economic conditions in the industry, supply, demand and incentives fundamental to fulfilling the basic regulatory purpose. These errors of the court below as to basic regulatory concepts and methods are in conflict with the spirit and philosophy of this Court's decision approving the Commission's initial efforts in experimenting with producer area rate regulation, as stated in *Wisconsin* v. *Federal Power Commission, supra,* at 310, wherein the Court cited with approval the prior opinions and analyses of Mr. Justice Jackson in *Federal Power Commission* v. *Hope Natural Gas Company,* 320 U.S. 591, 628-660, and in *Colorado Interstate Gas Company* v. *Federal Power Commission,* 324 U.S. 581, 608-615. These errors are even in conflict with the Commission's Opinion No. 338, 24 FPC 537 (1960)* where the Commission recognized that producer regulation could not be based on a cost of service approach, stating at 24 FPC 542-544:

> "Experience of the Commission in this case, as well as in many other producer rate cases during the last five years, has shown, beyond any doubt, that the traditional original cost, prudent investment rate base method of regulating utilities is not a sensible, or even a workable method of fixing the rates of independent producers of natural gas. . . .
>
> "Producers of natural gas cannot, by any stretch of the imagination, be properly classified as traditional public utilities. Justice Harlan, dissenting in the recent case of *Sunray Oil Co.* v. *F.P.C.,* 364 U.S. 137 at p. 160, characterized the difference as follows:

---

* *Phillips Petroleum Company,* affirmed in *Wisconsin* v. *Federal Power Commission, supra.*

"* * * A pipeline performs a service akin to those traditionally performed by public utilities. The independent producer, on the other hand, is unique among the objects of public-utility regulation because it is not engaged in rendering a service to the public in the conventional sense of that concept, but rather simply in selling a commodity which it owns * * *"

"We are not dealing with a service requiring certain equipment at known costs. We are dealing in many instances with one of two commodities produced with the same equipment and processed to varying degrees prior to sale. The price of the second commodity, oil, is unregulated, as is that part of the gas, which is sold in intrastate commerce or other transactions not subject to our jurisdiction, as well as the products which are extracted prior to shipment. Thus we are faced with the extremely difficult problem of allocating costs between the regulated and unregulated products . . .

". . . In the case of the producer, the amounts involved in the allocations of costs are major in size and extremely difficult to make. The result is that a producer actually could become bankrupt, or could make enormous profits, depending merely on the methods of allocation used . . .

"Further experience may enable us to refine and improve our allocation methods, but it is clear that the calculation of the unit cost of gas is, and will be an inexact, complex, unsatisfactory, and time consuming process, fraught with controversy. The result finally reached may give the illusion of accuracy since mathematical processes are involved, and a definite price per Mcf is the final result. But such a result must be tested against the realities of the market place. Thus, prices calculated solely on the cost rate base principle cannot be accepted if they are higher than a buyer will pay, or lower than a seller will accept.

"When an unrealistic result is reached, the formulae for allocations must be changed, in order to bring about a reasonable result. The allocation methods then be-

come a means of supporting a result already arrived at, rather than a means of arriving at a result which was previously unknown."

and at 24 FPC 547:

"From the foregoing, it follows that effective regulation of the price of natural gas must be on some more manageable plan than the rate base method. Thus it is clear that the better method would be to establish fair prices for the gas itself and not for each individual producer. . . . It appears that the ultimate solution to producer regulation will be in the determination of fair prices for gas, based on reasonable financial requirements of the industry and not on the particular rate base and expenses of each natural gas company. . . .

"Our ultimate objectives will be to set prices in all producing areas which will be adequate to maintain the gas supplies needed by the consumers of the nation, but at prices that are no higher than are necessary to accomplish that purpose."

Rejecting a cost of service method of producer regulation in favor of a better suited method, the Commission continued at 24 FPC 548:

"Nowhere in the Natural Gas Act is there as much as one word which indicates that this Commission must use a rate base in determining just and reasonable rates. The correct construction of the Natural Gas Act on this question, both as a legal and as a practical matter has been made by the Court of Appeals of the Fifth Circuit in *Forest Oil Corporation* v. *F.P.C.*, 263 F. 2d 622 (1959), wherein the Court said:

" 'We do not think that either the Commission or the petitioner should be baffled or handicapped in this new field of regulation by any formulas by whatever name they are known. . . .'

"In dealing with competitive industries such agencies as the Interstate Commerce Commission have found it

> best to work out regulatory principles based on numerous other standards and criteria. Producer regulation will have to be based on similar considerations. As Justice Jackson . . . concluded in the *Hope* case, *supra,* at page 650:
>
> "'* * * If natural gas rates are intelligently to be regulated we must fit our legal principles to the economy of the industry and not try to fit the industry to our books * * *.'"

Another essential question which must be resolved is the validity of the Commission's artificially contrived dual price system, which disregards the economic truth that natural gas is, indeed, one commodity having one value to consumers. As this Court has recognized, producer area ratemaking involves "regulating the price of a commodity," natural gas. *Wisconsin* v. *Federal Power Commission, supra,* at p. 310. The narrowly conceived dual price system, compounded by separate pricing of gas by types and vintages without regard to economic value, threatens to perpetuate a harsh, inequitable and discriminatory pattern of pricing which will prove harmful to the public interest in discouraging and restricting needed exploration and production of natural gas.

Moreover, both the Commission's Permian Basin area opinion and the opinion of the Court of Appeals contain inconsistencies which must be resolved by this Court. The Commission's regulatory method, which fixes *ceiling* prices based on *average* costs, is an irrational method which cannot permit full recovery of costs by the industry, as recognized by the Court of Appeals. If all rates above the ceilings must be reduced to the ceiling, the only way to recover average costs is to increase all rates below the ceiling up to the ceiling. This, the opinions and orders below do not permit.

A further regulatory inconsistency apparent on the face of the Commission's opinion, and not corrected by the Court of Appeals, is the requirement that refunds be made on any given sale where a producer has collected a contract price above the area ceiling rate, without taking account of the myriad other sales where the same producer, or other producers in the industry group, have collected contract prices *below* area ceiling rates. The area ceiling rates were determined by the Commission on the basis of composite group costs, where high costs incurred by some producers and as to some sales were averaged with low costs incurred by other producers and as to other sales. Under the opinion of the court below, however, rates must satisfy the "end-result" test of permitting recovery of revenue requirements. In testing the "end-result," industry *group revenues* at the area rates adjusted for quality differentials must be compared and balanced with the industry *group costs,* or revenue requirements, which were used to determine the area ceiling rates. If the existing rates, determined and tested on a group basis for the area, do not meet this test, clearly refunds below existing rates, which would result in still more inadequate rates and less recovery of revenue requirements, should not be ordered. Such refunds should not be ordered on the basis of revenues collected under individual contracts for given producer sales. Refunds, like rates, should be tested on the same standard of group revenue requirements.

This Court must correct the imposition of a moratorium on rate increases because such a moratorium would unlawfully freeze "just and reasonable" rate determinations, contrary to this Court's decision in *United Gas Improvement Co.* v. *Callery Properties,* 382 U.S. 223 (1965). In the *Callery* case, this Court recognized that the moratorium

conditions there imposed pursuant to certificate proceedings under Section 7 of the Natural Gas Act were valid only as an interim measure pending determination of just and reasonable rates in a subsequent rate proceeding under Sections 4 and 5 of the Act. Moreover, the interim certificate moratorium conditions before this Court in *Callery* limited filing for rate increases only above a "triggering" price level considerably higher than the "in-line" certificate price levels determined in that case. In this case, the purported just and reasonable rates for the Permian Basin Area have been determined; there is no basis for an interim Section 7 moratorium as in *Callery*.

The 2½ year moratorium on all rate increases and filings above applicable ceilings conflicts directly with the provisions of Sections 4 and 7 of the Natural Gas Act. Section 4 of the Act permits sellers of natural gas to file any contractually agreed rate changes subject only to the express statutory 30 day delay required to give notice of the rate change and subject to the Commission's discretion to suspend the rate change for another five months. The Act, in thus expressly authorizing up to six months' "moratorium" on a rate change, precludes the Commission from imposing a much longer moratorium not sanctioned by Congress or completely prohibiting filing for certain rate increases. Section 7 permits buyers and sellers initially to set rates by contracts and sellers to apply for certificates at such rates, relegating the Commission's role to one of review.

In further failing to involve itself at all with any judicial review of the Commission's costing methods, data and results, the Court of Appeals has abjectly abdicated its ordained judicial review functions under § 19 of the Natural Gas Act. This manifest and admitted dereliction of the

Court would deprive Petitioners and all other producers of any effective judicial review whatever of Commission actions in ratemaking because rates are made on the basis of costs. This deprivation of due process is also clearly contrary to the review functions of the Court of Appeals and such decision is in conflict with the decision of the Court of Appeals for the District of Columbia Circuit in *Mississippi River Fuel Corporation* v. *Federal Power Commission,* 163 F. 2d 433 (1947). In that case the Court held in detail that the proper judicial review of regulatory ratemaking must involve review in some detail of the propriety of the elements composing the total rate. There the Court, rejecting the Commission's contention that the judicial review function in ratemaking should be circumscribed, stated in part:

> ". . . The Commission seems to contend that the court must examine the rate per se, as an *abstraction,* or as a *naked economic fact, divorced from the elements of which it is composed and regardless of its effect;* and if it appears fair and reasonable upon such examination, it must stand. Such contention is without merit, either upon reason or upon authority, and moreover is impossible of practice.
>
> * * *
>
> ". . . So far as we know, *there is no rate case in American reports in which the proper rate has not been determined by a determination of these components and then their combination into a total. And there is no reported court review which was not concerned with one or more of those components.* Constitutional restrictions upon government control of public utility rates have been held by the courts to require this sort of process.
>
> * * *

> "It follows from the foregoing that a court can review the fairness, reasonableness and non-confiscatory character of a rate *only by reviewing the propriety of the elements of which the rate was composed.* No other way is known to our law, or ever was followed by any authority so far as we know. No standard is available for use in any other process of review." [emphasis supplied.]

For all practical purposes the court below approved the rate levels established by the Commission. The attention of the court was especially directed to hundreds of pages of expert witness testimony in the record before it attesting the need of prices in the order of 20 cents per Mcf. The attention of the court was especially directed to over 100 pages of exhibits in the record before it further demonstrating the need for prices at or above 20 cents per Mcf. This Court must decide if this relevant and decisive evidence was properly ignored, or if such evidence should have compelled the establishment by the Commission of higher rates.

The questions presented in this landmark case are substantial and important questions of law affecting the ultimate welfare of the entire natural gas producing industry of the nation and the consuming public relying upon that industry. This case may well be the culmination of the titanic effort of the Commission to find a solution to producer regulation over the past 13 years. Also, the court's decision below is in conflict with other judicial decisions, and as has been shown above, there is likelihood that petitioners will succeed in having that decision reversed respecting all or some of the questions presented.

CONCLUSION

WHEREFORE, Petitioners respectfully pray that the Court grant a writ of certiorari to the United States Court of Appeals for the Tenth Circuit to review the questions presented herein.

Respectfully submitted,

Intervenors.

ON PETITION TO REVIEW ORDERS
OF THE FEDERAL POWER COMMISSION

Sherman S. Poland for Skelly Oil Company, petitioner in No. 8385. With him on the brief were Hawley C. Kerr, Richard J. Dent, Bradford Ross, and Ross, Marsh & Foster. Kenneth Heady, Carroll L. Gilliam, Jesse H. Foster, Jr., Oliver L. Stone, James J. Flood, Jr., Bruce R. Merrill, and Warren M. Sparks for the petitioners in Nos. 8409, 8440, 8455, 8458, 8460, 8482, 8488, 8489, 8490, 8493, 8494, 8497, 8505, 8517, 8534, 8540, 8541, 8542, 8588, and 8589. With them on the briefs were:

Thomas H. Burton, Jr., and Joseph C. Johnson for Continental Oil Company;

J. P. Greve for Sunray DX Oil Company;

A. A. Davidson, Charles Holmes, and Charles E. McGee for Sinclair Oil & Gas Company;

Homer D. Johnson and Boyd D. Taylor for Cabot Corporation;

Dixon Morgan, McAfee, Hanning, Newcomer, Hazlett & Wheeler, and Richard F. Remmers for Sohio Petroleum Company;

Eldon E. Scott, Donald J. Mulvihill, and Cahill, Gordon, Reindel & Ohl for Joseph E. Seagram & Sons, Inc., and Joseph E. Seagram & Sons d/b/a Texas Pacific Oil Company;

H. Y. Rowe for Murphy Corporation;

Chester L. Wheless for The Nueces Company;

George N. Otey, Jr., for Samedan Oil Corporation;

John C. Snodgrass and Vinson, Elkins, Weems & Searls for Union Oil Company and as successor to The Pure Oil Company;

Clyde E. Willbern for Tidewater Oil Company;
T. J. Caldwell, Jr., and Jerome M. Alper for Reef Corporation;

Edward R. Hudson for William A. & Edward R. Hudson, Joint Operators;

All as joint and several petitioners in No. 8493;

Cecil N. Cook and Neal Powers, Jr., for Midhurst Oil Corporation, petitioner in Nos. 8493 and 8505;
Wm. J. Zeman, Lloyd G. Minter, John R. Rebman, and Stanley L. Cunningham for Phillips Petroleum Company, petitioner in No. 8409;

Donald R. Arnett and Kenneth C. Keener for Gulf Oil Corporation, petitioner in Nos. 8493 and 8534, and Warren Petroleum Corporation, petitioner in Nos. 8493 and 8440;

Cecil C. Cammack, R. J. Leithead, and Graydon D. Luthey for Cities Service Oil Company (formerly Cities Service Petroleum Company), Cities Service Production Company (now merged with Cities Service Oil Company), and Columbian Fuel Corporation, petitioners in No. 8493, and Coltexo Corporation and Columbian Carbon Company, petitioners in No. 8517;

Joseph W. Morris and Edwin S. Nail for Amerada Petroleum Corporation, petitioner in Nos. 8493 and 8542;

Tom P. Hamill; Robert D. Haworth, Donald G. Canuteson, and D. Lamar Smith for Mobil Oil Corporation (formerly Socony Mobil Oil Company, Inc.), petitioner

in Nos. 8455 and 8588, and Northern Natural Gas Producing Company, petitioner in No. 8460;

J. P. Hammond, T. C. McCorkle, William H. Emerson, and Clifford O. Stone, Jr., for Pan American Petroleum Corporation, petitioner in No. 8458;

William K. Tell, Jr., for Texaco Inc., petitioner in Nos. 8482 and 8541;

Carl Illig and William H. Holloway for Humble Oil & Refining Company, petitioner in No. 8488;

Thomas G. Johnson for Shell Oil Company, petitioner in No. 8489;

Stuart J. Scott, Bernard A. Foster, Jr., and Ross, Marsh & Foster for The Atlantic Richfield Company (formerly The Atlantic Refining Company), Southland Royalty Company, Westates Petroleum Company and Dorchester Gas Producing Company, petitioners in No. 8490, and The British-American Oil Producing Company, petitioner in No. 8497;

Clayton L. Orn, Joseph F. Diver, Morton Taylor, and Jack Fariss for Marathon Oil Company, petitioner in Nos. 8494 and 8540;

F. H. Pannill, Hamilton E. McRae, and Stubbeman, McRae, Sealy & Laughlin for J. C. Barnes, et al., petitioners in No. 8589.

Claude Proctor, Justin R. Wolf, Eugene E. Threadgill, and Wolf & Case were on the brief for Standard Oil Company of Texas, a Division of Chevron Oil Company, petitioner in No. 8479.

Robert W. Henderson for Hunt Oil Company, et al., petitioners in No. 8487. With him on the brief was Paul W. Hicks.

Louis Flax for Sun Oil Company, petitioner in No. 8495. With him on the brief were Phillip D. Endom, Robert E. May, and May, Shannon and Morley.

William I. Powell for Independent Petroleum Association of America, petitioner in No. 8496. With him on the brief was L. Dan Jones.

H. W. Varner for Superior Oil Company, petitioner in No. 8510. With him on the brief was Murray Christian.

J. Evans Attwell for Perry R. Bass, et al., petitioners in No. 8511. With him on the brief were W. H. Drushel, Jr., and Vinson, Elkins, Weems & Searls.

Waggoner Carr, Attorney General, for the State of Texas, petitioner in No. 8519. With him on the brief were Hawthorne Phillips, First Assistant Attorney General, T. B. Wright, Executive Assistant, J. Arthur Sandlin, C. Daniel Jones, Jr., and Linward Shivers, Assistant Attorneys General, of the State of Texas.

Lewis G. Mosburg, Jr., for Big Chief Drilling Company, et al., petitioners in No. 8521. With him on the brief were A. P. Murrah, Jr., Leland C. Neeley, Jr., Mosteller, Andrews & Mosburg, Jerry F. Lyons, and Underwood, Wilson, Sutton, Heare & Berry.

John Davenport for Texas Independent Producers & Royalty Owners Association and West Central Texas Oil and Gas Association, petitioners in No. 8528.

Boston E. Witt, Attorney General, and William J. Cooley, Special Assistant Attorney General, for the State of New Mexico, petitioner in No. 8529.

Richard A. Solomon, General Counsel, and Peter H. Schiff, Deputy Solicitor, Federal Power Commission, for the respondent. With them on the brief were Howard E. Wah-

renbrock, Solicitor, Leo E. Forquer, David J. Bardin, Assistant General Counsels, Alan J. Roth, and James D. Annett, Attorneys, Federal Power Commission.

J. Calvin Simpson, Senior Counsel, for People of the State of California, Public Utilities Commission of the State of California, City of Los Angeles, City of San Diego, and City and County of San Francisco, intervenors. With him on the brief were:

Mary Moran Pajalich, Chief Counsel, and William N. Foley, Associate Counsel, for the People of the State of California and Public Utilities Commission of the State of California;

Roger Arnebergh, City Attorney, for the City of Los Angeles;

Edward T. Butler, City Attorney, and Edwin L. Miller, Jr., Assistant City Attorney, for the City of San Diego;

Thomas M. O'Connor, City Attorney, William F. Bourne, Public Utilities Counsel and Deputy City Attorney, and McMorris M. Dow, Deputy City Attorney, for the City and County of San Francisco.

William L. Cole, Malcolm H. Furbush, and C. Hayden Ames for Pacific Gas and Electric Company, Pacific Lighting Service and Supply Company (formerly Pacific Lighting Gas Supply Company), San Diego Gas & Electric Company, Southern California Gas Company and Southern Counties Gas Company of California, intervenors. With them on the brief were:

John Ormasa and Roger J. Nichols for Pacific Lighting Service and Supply Company, Southern California Gas Company, and Southern Counties Gas Company of California;

Frederick T. Searls and Stanley T. Skinner for Pacific Gas and Electric Company;

Sherman Chickering and Donald J. Richardson, Jr., for San Diego Gas & Electric Company.

A brief Amicus Curiae supporting respondent was filed by J. David Mann, Jr., John E. Holtzinger, Jr., Frederick Moring, and Morgan, Lewis & Bockius on behalf of the Associated Gas Distributors Group.

Oklahoma Independent Petroleum Association, A & R Pipe Co., et al., Panhandle Producers & Royalty Owners Association, and Malouf Abraham Company, et al., joined in the brief of Big Chief Drilling Company, et al., as Amicus Curiae supporting petitioners.

Before LEWIS, BREITENSTEIN and HILL,
Circuit Judges.

BREITENSTEIN, Circuit Judge.

The first area rate decision of the Federal Power Commission is before us for review. It relates to prices for jurisdictional sales of natural gas produced in the Permian Basin, a famous petroleum area where oil and gas are found in hundreds of reservoirs and thousands of wells. The states of Texas and New Mexico, the nation's oil and gas industry, and several related associations attack the decision. The State of California, the cities of San Francisco, Los Angeles, and San Diego, various local distributors, and an organization of such distributors support it. The rejection of the individual company cost-of-service approach to the regulation of independent producers and the adoption of the area rate method raise many novel issues which have been extensively and ably argued. We hold that neither the United States Constitution nor the Natural Gas Act bars the regulation of natural-gas prices on an area basis; that the Commission did not abuse its discretion in adopting the area method; and that the cases must be remanded because the actions of the Commission do not comply with the end result test established in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602-603, and other decisions.

The petitions for review, all brought under § 19(b) of the Natural Gas Act,[1] attack Opinions Nos. 468 and 468-A of the Commission fixing just and reasonable rates under

---

[1] 15 U.S.C. §§ 717-717w.

§§ 4 and 5 of the Act for natural gas produced in the Permian Basin and sold to interstate pipeline companies.

1. **Background.**

The Permian Basin, as defined by the Commission, includes Texas Railroad Commission Districts Nos. 7-C, 8, and 8-A and the New Mexico counties of Chaves, Eddy, and Lea. Nationally, it accounts for about 11% of all the gas sold in interstate commerce. The Commission joined 336 producers as respondents in the consolidated proceedings. Sales by them are made to three interstate pipelines, none of which appear here.[2] About 85% of the Permian gas moving interstate goes to California.

Nearly two-thirds of the Permian gas production comes from oil-well gas, that is, gas produced in conjunction with oil. Because of impurities much of the gas must be processed before introduction to an interstate pipeline. Until El Paso began its purchases, Permian oil-well gas was generally vented or flared because of the lack of a market.

The natural-gas industry has three main parts, the producers, the interstate pipelines, and the distributors. The last are under state or local regulation exclusively. The Commission began federal regulation of the interstate pipelines after the passage of the Natural Gas Act of 1938. It did not attempt to regulate independent producers[3] until the 1954 decision of the Supreme Court in Phillips Petro-

---

[2] El Paso Natural Gas Company began buying Permian gas in 1945, Northern Natural Gas Company through a predecessor in 1954, and Transwestern Pipeline Company in 1958. In 1961, El Paso purchased 73% of the Permian gas moving in interstate commerce, Northern 18%, and Transwestern 9%.

[3] The word "independent" is used to describe a producer which does not transmit gas interstate either by its own operations or those of an affiliate. Some of the interstate pipelines produce a share of their own gas and sell gas to other pipelines.

leum Co. v. Wisconsin, 347 U.S. 672, (First Phillips) which held that the Act applied to them.

Section 7 of the Act forbids the sale of natural gas subject to Commission jurisdiction without a certificate of public convenience and necessity granted after notice and hearing. Temporary certificates, issued without notice and hearing, are authorized. Our recent decision in Sunray DX Oil Company v. Federal Power Commission, 10 Cir., ... F. 2d ....., discusses § 7 procedures and problems. These are not present here because the § 7 applications considered in the consolidated proceedings before the Commission were disposed of in a separate order.

Section 4 requires that all rates shall be just, reasonable, and nondiscriminatory. No change shall be made in a rate without 30 days' notice. When a schedule containing a changed rate is filed, the Commission on its own initiative or on complaint may suspend the rate and set the matter for hearing. The suspension may be for not longer than five months. If no decision is reached within that period, the increased rate becomes effective but the Commission may require a bond conditioned upon the refund of that portion of the increased rate found not to be justified. The instant proceedings involve a number of increased rate filings which were suspended under § 4 and which were disposed of by Opinions Nos. 468 and 468-A.

Section 5 provides that whenever the Commission, after hearing had on its own motion or on complaint, finds that a rate is "unjust, unreasonable, unduly discriminatory, or preferential" it shall determine "the just and reasonable rate." In the proceedings at bar the Commission pursuant to § 5 established "the future rates for jurisdictional sales of gas by producers in the area."

After the First Phillips decision the Commission received thousands of certificate applications from producers. The situation was complicated by the need of pipelines for a committed source of supply sufficient to justify financing. To obtain such supply long-term contracts, commonly for 20 years, were made with the producers. They in turn, because they could not file unilaterally for an increased rate contrary to contract and because they desired protection against the unforeseeable economic conditions of the future, insisted on escalation clauses of various types.[4] A general price rise occurred. As the escalation provisions became operative the producers filed under § 4 for increased rates and the Commission suspended many of them. Section 7 applications were under contracts calling for rates comparable to those which the Commission had suspended. This trend was ended by the 1959 decision in Atlantic Refining Co. v. Public Service Commission of New York, 360 U.S. 378, (CATCO) which directed the Commission in certificate cases to keep initial prices in line.

After the remand in First Phillips, the Commission proceeded with the consideration of just and reasonable rates required by §§ 4 and 5 on the individual company cost-of-service basis which it had long applied in the regulation of electric power companies and interstate pipelines. The first case to reach the decisional stage was that relating to Phillips. On September 28, 1960, the Commission entered Opinion No. 338[5] in which it held that the regulation of independent producers under the Act could be accomplished more appropriately by the establishment of area rates than by the establishment of producer rates on individual cost-of-service findings. Contemporaneously with this Phillips

---

[4] See Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F. 2d 241, 243.

[5] 24 FPC 537.

decision, the Commission promulgated its Statement of General Policy No. 61-1[6] which established 23 rate areas and, with unimportant exceptions, announced maximum rates for each area. Two price standards were set, one for initial prices in new contracts and one for escalated prices in existing contracts. For the Permian Basin area the prices were 16 cents and 11 cents respectively.

Opinion No. 338 was affirmed by the Court of Appeals for the District of Columbia Circuit[7] and by the Supreme Court in Wisconsin v. Federal Power Commission, 373 U.S. 294, 310, (Second Phillips) wherein the Court observed that it shared "the Commission's hopes that the area approach may prove to be the ultimate solution" to the problem of regulating the independent producers.

The first area rate proceeding was that for the Permian Basin and was initiated on December 23, 1960.[8] It was followed by a similar proceeding for the South Louisiana area,[9] for the Hugoton-Anadarko area,[10] and for the Texas Gulf Coast area.[11] The last three are in the hearing stage. The Permian Basin proceeding was decided by Opinions Nos. 468 and 468-A to which we turn.

2. The Decision of the Commission.

The 131-page original opinion, No. 468, followed by the 23-page opinion denying rehearing, No. 468-A, need only be summarized at this point. The Commission found the area rate principle free from constitutional and statutory

objections and adopted it. Contract prices were rejected as a basis for regulation and the reserves to production ratio was declared to be an inappropriate regulatory standard. The Commission set up a two-price system. It differentiated between gas produced as the sole product of a well, referred to as gas-well gas, and gas produced in association with oil, known as oil-well gas or casinghead gas. One price was established for new gas-well gas and the residue therefrom sold under contracts made on or after January 1, 1961. A second price was established for flowing gas which was defined to include gas-well gas sold under contracts executed before the mentioned date, casinghead gas, and residue gas derived from either source. The January 1, 1961, date of division between new gas-well gas and oil gas-well gas was adopted because that was the approximate date when the industry became able to direct its exploration efforts toward finding gas-well gas as distinguished from finding gas as a by-product in the search for oil. For new gas-well gas the Commission fixed a rate of 16.5 cents per Mcf for the Texas Railroad Districts inclusive of state and local taxes and a rate of 15.5 cents per Mcf for the New Mexico counties exclusive of applicable state and local production taxes. For flowing gas the respective rates were 14.5 cents and 13.5 cents.

In determining these rates the Commission gave consideration to composite costs but treated the two categories of new gas-well gas and flowing gas differently. It said that the price of the former "was geared to the cost of finding and producing future gas supplies and as such was built up primarily from nationally published statistics and the questionnaire data." For flowing gas it said "our touchstone is the historical cost of gas being produced in the Permian Basin area."

The Commission required adjustment on an individual company basis from the stated prices to reflect differentials from the quality standards. These downward adjustments are determined "by the net cost of processing the gas to bring it up to standard." A downward adjustment is also required if the Btu content is less than 1,000 per Mcf and an upward adjustment is permitted if that content is above 1,050.

Small producers, defined as those making less than 10 million Mcf of jurisdictional sales annually, are exempt from the quality adjustments and from certain filing requirements.

The Commission set a minimum price of 9.0 cents per Mcf. Provision is made for special exemption from area rates. Refunds of excess collections are required on an individual company basis. The possibility of changes in area rates is recognized. A moratorium, until January 1, 1968, is declared on rate increases and indefinite escalation clauses are prohibited.

Three commissioners filed separate opinions. With one exception Commissioner O'Connor approved the results reached but said that "the contract price at which most producers are able and willing to operate is just and reasonable" and that "composite costs best serve as a check on average field prices to preclude significant price departures." He disapproved the Btu adjustment saying that an upward adjustment should be applied for all gas having a Btu content in excess of 1,000. Comissioner Ross was critical of accounting methods used and pointed out the need for simplification. He dissented from the division date between new and old gas-well gas. In his view the new gas-well gas price should apply to gas sold after the date of the Commission decision. Commissioner Black said that the allowed 12% rate of return on net investment "is

very probably a generous one" but was justified by the special risk of finding substandard gas in the Permian Basin.

3. Disqualification of Two Commissioners.

The Continental Group of petitioners urges that Commissioner Black was disqualified to participate in the decision. The Independent Petroleum Association of America, (IPAA) complains of the participation of both Commissioners Swidler and Black. The claim is that each of them had prejudged the issue of whether substantial competition existed among producers. Additionally, Commissioner Black is accused of personal bias against the producers. The charges stem from public addresses made in 1964.[12] No claim is made that either commissioner prejudged the ultimate issue of a just and reasonable rate. In our opinion no basis for disqualification arises from the fact or assumption that a member of an administrative agency enters a proceeding with advance views on important economic matters in issue. Nothing in the record disturbs the assumption that the two commissioners are "men of conscience and intellectual discipline, capable of judging a particular controversy fairly on the basis of its own circumstances."[13] The cases cited by Continental and IPAA are not in point.[14]

---

[12] A motion for the disqualification of Commissioner Black was made to and denied by the Commission. We find no similar motion in the record pertaining to Commissioner Swidler.

[13] United States v. Morgan, 313 U.S. 409, 421. See also Federal Trade Commission v. Cement Institute, 333 U.S. 683, 700-703.

[14] In Texaco, Inc., v. Federal Trade Commission, D.C. Cir., 336 F. 2d 754, vacated 381 U.S. 739, the charge was precommitment of a commissioner on the guilt of an accused. In Gilligan, Will & Co. v. Securities and Exchange Commission, 2 Cir., 267 F. 2d 461, certiorari denied 361 U.S. 896, a similar charge was made

4. Objections of Texas and New Mexico.

The states of Texas and New Mexico, besides adopting the briefs and arguments of the Continental Group, assail the Commission decision on grounds peculiar to them in their governmental capacity. They say that the public interest, which the Commission is required to protect, includes the producing states as well as the consuming states; that the prices which the Commission has set will cause a cessation or curtailment of exploration and development activities to the serious injury of the economy of the Permian Basin; that waste rather than conservation of a natural resource will result; and that the states and their public entities will suffer severe losses in taxes and royalty payments.[15] Similar arguments were made by West Virginia in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 607-614, and were rejected by the Supreme Court which said that when Congress passed the Natural Gas Act it "was quite aware of the interests of the producing states in their natural gas supplies" and that nothing in the Act intimates that high prices should be maintained so that "the producing states obtain indirect benefits." The rejection of the state's contentions in Hope requires the rejection of the same contentions here.

Texas and New Mexico also argue that the Commission has unlawfully interfered with their power of taxation.

---

against a commission. Amos Treat & Co. v. Securities and Exchange Commission, D.C. Cir., 306 F. 2d 260, related to a charge against a commissioner who had previously served as a staff member in the investigation which led to the complaint.

[15] In Texas 4.7 million acres of public lands are within the Permian Basin and in New Mexico over 3 million acres. Much of this land is leased for oil and gas and produces royalty income.

The Commission fixed the rates of gas produced in Texas to include all state taxes and in New Mexico to exclude such taxes. It said that: "In the event of any increase in taxes in Texas or New Mexico, the Commission will consider whether ceiling prices shall be increased and, if so, to what extent." The states' arguments are premature. The Commission has allowed all present taxes as a cost item. Nothing in the Commission decision inhibits the states from increasing those taxes. The Commission has said that if they do, it will determine whether such increases should be passed on to the consumer or remain on the shoulders of the producers. The question of whether increased state taxes will unreasonably burden interstate commerce is hypothetical at this stage.

New Mexico complains that the establishment of a ceiling price plus existing taxes for gas produced in its portion of the Permian Basin denies to it the power to provide a tax incentive to producers by reducing the tax. The argument is not persuasive. If the New Mexico tax was reduced, the Commission could properly consider a rate decrease to reflect the tax decrease.

5. Legality of Area Rates for Permian Basin.

The problems confronting federal regulation of the natural-gas business, and particularly the independent producers, have been discussed several times[16] and need be only summarized. The interstate gas business is concerned with a wasting, nonreplenishable natural resource subject to production after discovery. At the point where the gas enters interstate commerce there are few buyers and thou-

---

[16] See opinions of Justice Jackson dissenting in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 628, and concurring in Colorado Interstate Gas Co. v. Federal Power

sands of sellers. The producers range from the financially powerful integrated oil companies to the wildcatters who operate on a shoestring. Their results are measured by the amount of gas produced — not by the amount of money invested. Exploration and development costs are financed out of current income and are charged to expense rather than capital. The uncertainty of the business causes substantial cost and revenue fluctuations not only from producer to producer but also from year to year for the same producer. A regulated commodity, gas, is produced in substantial quantities along with an unregulated commodity, oil. The allocation of costs between them baffles the experts and presents the temptation to use mathematical means of arriving at a predetermined result. The same rate may bring a financial windfall to one producer and a financial disaster to another. The price of gas must be competitive with that of other sources of energy and must be sufficienlty attractive to encourage a continued search for new supplies.

In Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 582, a case relating to pipeline rates, the Court held that the provisions of the Act were consistent with the due process clause of the Fifth Amendment and within the commerce power. Another pipeline case, Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602, says that in fixing rates the Commission is "not bound by the use of any single formula or

---

Commission, 324 U.S. 581, 608; dissenting opinion of Justice Douglas in First Phillips, 347 U.S. 672, 687; dissenting opinions of Justice Clark in First Phillips, 347 U.S. 672, 690, and in Second Phillips, 373 U.S. 294, 315; dissenting opinion of Justice Harlan in Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 159; and Opinion No. 338 of the Commission, 24 FPC 537, 542-548.

combination of formulae"; that "under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling"; and that the impact of the rate order rather than the theory behind it is the governing criterion. The "end result" test of Hope was followed in Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 605-606.

Second Phillips, 373 U.S. 294, holds that the Commission did not abuse its discretion in terminating the § 5 investigation of Phillips' rates and substituting an area basis for an individual company basis. The Court reaffirmed the principles announced in Natural, Hope, and Colorado Interstate, recognized the difficulties inherent in the regulation of the price of natural gas, shared the Commission's hope for the success of the area approach, and observed that the "case might be different if the area approach had little or no chance of being sustained."[17] At the same time, the Court pointed out that "the lawfulness of the area pricing method" was not before it for review.[18] Four justices dissented in an opinion which characterized the area rate policy of the Commission as "a new, untried, untested, inchoate program which, in addition, is of doubtful legality."[19]

In Callery[20] the Court mentioned that the § 7 proceedings before it had at one time been consolidated with the South Louisiana area rate proceedings. Contrary to the argument of the California Distributors the Court did not, tacitly or otherwise, approve area rate regulation. The

most pertinent comment is that of Justice Harlan in his concurring and dissenting opinion who said that area pricing "ultimately aims to simplify proceedings under the statute."[20a]

We cannot accept the arguments of the Commission and the California groups that the Supreme Court has determined the validity of area pricing under the Act. We read the decisions to mean that the Court has permitted the Commision to go forward with the area rate experiment and wishes it good luck in the development of a workable procedure which will be free from constitutional and statutory pitfalls.

Governmental price regulation of services and commodities on a group or geographical basis has been upheld in a number of decisions[21] under the federal commerce and war powers and under state police powers. Those supporting the Commission place great reliance on these decisions. The producers painstakingly distinguish each from the case at bar. We decline to be drawn into these tortuous sidepaths because we are convinced that the "translation of an impli-

---

[20a] Id. at 231.

[21] See The New England Divisions Case, 261 U.S. 184 (ICC — divisions of joint rates); Aetna Insurance Co. v. Hyde, 275 U.S. 440 (Missouri regulation of fire insurance rates); Tagg Bros. v. United States, 280 U.S. 420 (Packers and Stockyards Act of 1921); Nebbia v. New York, 291 U.S. 502 (New York Milk Control Act); United States v. Rock Royal Co-op., 307 U.S. 533 (Agricultural Marketing Agreement Act of 1937); Sunshine Anthracite Coal Co. v. Adkins, 310 U.S. 381 (Bituminus Coal Conservation Act); Bowles v. Willingham, 321 U.S. 503 (Emergency Price Control Act of 1942); New York v. United States, 331 U.S. 284 (ICC — railroad rates); and Ayrshire Collieries Corp. v. United States, 335 U.S. 573 (ICC — railroad rates).

cation drawn from the special aspects of one statute to a totally different statute is treacherous business."[22] Specific reference need be made to only one decision. Several producers emphasize the statement in Bowles v. Willingham, 321 U.S. 503, 517, that in the Natural Gas Act "Congress has provided for the fixing of rates which are just and reasonable in their application to particular persons or companies." The argument is that by this language the Supreme Court has recognized that regulation under the Act is on an individual company rather than group basis. We do not agree. The statement is dicta and whatever value it might have had as dicta was, in our opinion, destroyed by the blessing which the Court gave area rate making in Second Phillips.

Producers urge that the language of the Act is contrary to regulation on a group basis because all pertinent references to natural-gas companies are in the singular. First Phillips holds that an independent producer is a "natural-gas company" within the purview of the Act. Section 2, the definitions section, provides that "person" means an individual or corporation, and defines "natural-gas company" to mean a person engaged in transportation or sale of natural gas in interstate commerce. Section 4, covering the filing and changing of rates, refers to "any natural-gas company," "no natural-gas company," "every natural-gas company," and "the natural-gas company." Section 5, authorizing investigation and determination of rates, refers to "any rate," by "any natural-gas company" and to "such natural-gas company." Section 7 provides for certificates of public convenience and necessity and uses the terms "a natural-gas company," "no natural-gas company" and "such natural-gas company." The repeated use of the singular

---

[22] Federal Trade Commission v. Bunte Bros., 312 U.S. 349, 353.

rather than the plural is said to require that the just and reasonable rate of each particular seller be tested with reference to its peculiar circumstances and operations.

Opposing arguments point out that the Act does not prohibit group or area rate making and that § 16 empowers the Commission to perform any and all acts and to prescribe such orders, rules, and regulations "as it may find necessary or appropriate to carry out the provisions of this act."

The basic query is whether the just and reasonable standard applies on an individual company basis or on a group basis. Section 4(a) says that "all rates * * * made * * * by any natural-gas company * * * shall be just and reasonable * * *." If this means that each producer is entitled to a rate which will return its costs plus a reasonable profit, the inquiry is at an end because the Commission refused to receive individual cost figures.

The Natural, Hope, Colorado Interstate, and Second Phillips decisions all support the conclusion that in the regulation of natural-gas rates the Commission is not bound by any formula or method, and that the choice of the appropriate method for the determination of those rates lies in the sound discretion of the Commission. The appropriateness of the method depends on the peculiar characteristics of the natural-gas industry.

In its Opinion No. 338,[23] the Commission noted the reasons why the individual company cost-of-service method was inapplicable and unworkable. Among these were the lack of a fixed determinable relationship between investment and service to the public with the result that "a huge investment might yield only a trickle of gas, while a small investment might lead to a bonanza," the staggering allocation problems which could result in such anomalies as

[23] 24 FPC 537.

widely varying prices for gas coming from a jointly owned lease or even from a jointly owned well, and the intolerable administrative burden of requiring a separate rate determination for each of the several thousand independent producers.

The powerful contrary argument is that no area rate, whether based on composite costs, average aggregate costs or any other industry wide criteria, will suffice to assure a high cost producer of its costs to say nothing of a profit. We accept this as true.[24] The impact of an area rate in the natural-gas industry may have effects which cover the entire range from bonanza to bankruptcy. It is sufficient for us that these results were lucidly demonstrated in the dissenting opinion of Justice Clark in Second Phillips and did not deter the majority from allowing the Commission to proceed with its area rate program.

Some of the producers argue that if the Act is construed to permit area rate making, the Act is invalid under Art. I, § 1, of the United States Constitution because no legislative standards have been set for establishing groups or making group determinations. Reliance is had on Panama Refining Co. v. Ryan, 293 U.S. 388, which held that a delegation of legislative power to the President was unconstitutional because Congress, among other things, "has declared no policy, has established no standard, has laid down no rule."[25]

---

[24] An appendix to the Hunt brief presents an array of natural-gas costs of 44 Permian producers whose volumes total over 208 million Mcf. Of these, 16 producing over 170 million Mcf are shown to have costs of less than 14.5 cents. The remainder have costs running from 14.77 cents to 216.05 cents. We have been unable to check the accuracy of these figures and mention them only to show the claimed disparity of costs. Continental says that "approximately 67 percent of the companies and approximately 30 percent of the volumes had costs above the industry average cost level."

[25] 293 U.S. 388, 430.

Congress cannot delegate its power to enact laws but it can confer on an administrative agency the power to carry into effect laws which it has enacted.[26] In the New England Divisions Case, *supra,* the Court referred to the power given by Congress to the Interstate Commerce Commission to determine just and reasonable rates and said that Congress "intended that a method should be pursued by which the task * * * could be performed."[27] In Lichter v. United States, 334 U.S. 742, 785-786, the Court in discussing legislative standards said that the "standards prescribed by Congress are to be read in the light of the conditions to which they are applied" and for an example observed that "among those which have been held to state a sufficiently definite standard for administrative action [are] 'just and reasonable' rates for sales of natural gas."

In the regulation of the natural-gas industry "the actual necessities of procedure and administration"[28] have led to the adoption of the area rate method. We believe that neither constitutional nor statutory provisions prevent the use of that method and that the Commission did not abuse its discretion in adopting it. The more important and difficult question is that of the validity of the area rates which have been established. The controlling standard is the end result test of Hope. In our opinion, this test is accepted by, and reaffirmed in, the Second Phillips decision.

Some of the producers urge that the area rate method is not consistent with the characteristics of the industry and that contract prices satisfy statutory requirements because they have been reached through effective competition. The Commission considered and rejected the argument. It point-

CARD 4

ed to the history of price negotiations in the Permian Basin, to the urgent requirements of the pipelines, to the heavy percentage of sales by a few producers, and to the control of undisclosed and uncommitted gas reserves by a few producers. It concluded that the record fails to establish that a just and reasonable rate can be established through competition and that "the primary competition revealed by the record was among the pipelines to secure new gas supplies at higher prices." Commissioner O'Connor disagreed saying that "the contract price at which most producers are able and willing to operate is just and reasonable." His conclusion was that "profit oriented costs and supply oriented contracts do not, in the aggregate, depart in any significant manner from each other." We accept the conclusion of the Commission that competition has not been effective to fix a just and reasonable rate. It is supported by reasonable inferences from the record and they are binding on us.

Continental and Superior say that they were improperly denied an opportunity to be heard on the geographical propriety of the Permian Basin as a rate area. In its order instituting the proceedings the Commission eliminated the issue of the appropriateness of the area for rate making purposes.[29] The Commission may draw on its expertise to determine the ground rules for an investigation but in so doing may not deny a specific right.[30] The producers fail to convince us that any such denial has occurred here. The Permian Basin is a well known area. Unless prices are to be determined on a national basis, areas must be selected and defined. The Commission had two choices. It could first determine the national revenue requirement and di-

---

[30] Amax Petroleum Corporation v. Federal Power Commission, 10 Cir., 350 F. 2d 92, 94.

vide that up among the areas or it could first determine the various rates so that in the aggregate they meet that requirement. We are unwilling to assume that when all the area proceedings are completed the total revenue will not equal the national requirement. If it does not, both the producers and the consumers will suffer. In our opinion the Commission acted reasonably in selecting the Permian Basin for an area rate proceeding.

6. **The Two-Price System.**

The Commission's two-price system is vigorously attacked on many fronts. It will be remembered that one price is fixed for new gas-well gas and another for flowing gas. All agree that gas is a commodity which is valuable as a source of energy. The householder does not care whether the gas which burns at the tip of his appliance comes from a gas well, an oil well, or as a residue product. To him gas is gas.

The justification for the two-price system is that the higher price for new gas-well gas provides an incentive to explore for and develop new supplies. The producers do not question the finding that "the industry is increasingly becoming able to direct its exploration efforts toward finding new gas-well gas as distinguished from finding gas as a by-product in the search for oil." This ability may be confined to the larger companies which maintain the technical staffs skilled in making the necessary predictions. The smaller producers are in a less advantageous position. They may be relegated to the farmouts which the majors pass down to them or to operations in accord with their less scientific but sometimes financially rewarding hunches.

New gas discoveries are well said to be the life blood of the industry. The consumers may reasonably be required to pay the price needed to bring forth such discoveries. If

an incentive price based on current costs is used for all gas, windfalls will be assured to many producers of old gas developed under lower historical costs and often found in association with oil.

The producers say that a single-price system based on current costs is required because revenues for current exploration and development must be internally generated from sales of gas from whatever source. The Commission rejected the argument. The question is not so much the source of the funds as it is the inducement to use available funds in the search for gas. The higher price for new gas is intended to supply that inducement. Although the adequacy of the inducement can only be tested by future developments, we are not convinced that the refusal of the Commission to include the same inducement in the price of old gas, with the resulting likelihood of wind-falls, was unreasonable.

Continental, Phillips, and others argue that the two-price system amounts to entrapment because of the possibility of reduction in price after financial commitments have been made. Although the Commission which announced the Permian Basin decision cannot bind a future Commission, we credit the Commission with good faith. The possibility of a change does not invalidate the rate method employed. When and if a reduction occurs, the argument of entrapment can be heard.

The division date of January 1, 1961, for the different prices of new gas-well gas and old gas-well gas is another subject of dispute. Here the Commission found as a fact that the appropriate date was the approximate time when directional drilling came to be used effectively. Under the evidence the selection of a division date was an administrative problem calling for the exercise of judgment. In making its choice the Commission acted within the evidence and

within its powers. On rehearing, the Commission left open for future consideration the problem arising when new gas-well gas is developed from committed acreage. We assume that this problem will be met fairly when it comes to a head.

The two-price system is an outgrowth of directional drilling for gas. Its purpose is to assure a continued gas supply. The Commission frankly says that the adoption of the system for the Permian Basin "should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies." We find no persuasive reason why the test should not be made.

7. The Cost Information.

In arriving at the Permian Basin rates the Commission used many sources of cost information. These included responses to questionnaires sent to producers, the Census of Mineral Industries for 1958, the Chase Manhattan Bank's 1961 Annual Analysis of the Petroleum Industry, the World Oil Magazine, the Oil and Gas Journal, the Joint Association Survey,[31] and others. The producers attack these sources on many and varied grounds. The range of objections runs from hearsay evidence through deprivation of right of cross-examination to denial of procedural due process. To take up each of these objections would increase the length of this opinion to encyclopedic dimensions.

From the information so obtained the parties, the staff, and the Commission make many computations and reach many results. The assumptions, allocations, formulae, equations, averages, means, and massive calculations may intrigue a mathematician or statistician but they have no

---

[31] This is a survey of a few producers conducted by the American Petroleum Institute, the IPAA, and the Mid-Continent Oil and Gas Association.

attraction for us. We respectfully decline to be drawn into such a turmoil of numbers. We cannot in a few months unravel the snarl of statistics developed in the years of hearings. In our opinion the judicial process, in cases such as this, should be confined to consideration of errors of law. We leave to the experts the selection of source material and the calculations to be made therefrom. Our concern is with the result.

8. **The Commission's Price Determinations.**

The Commission said that "costs must be a major factor in determining the area price." On the basis of current national statistics plus questionnaire data it determined the 1960 Mcf cost of new gas-well gas thus:

Exploration and Development Costs	
Dry Holes	1.42 cents
Other Exploratory Costs	1.59
Adjustments for Exploration in Excess of Production	1.11
Production Operating Expense	2.70
Net Liquid Credit	(3.10)
Regulatory Expense	.14
Depletion, Depreciation, and Amortization of Production Investment Costs	
Successful Well Costs	2.88
Lease Acquisition Costs	.76
Cost of Other Production Facilities	.31
Return of Production Investment (at 12%)	5.21[32]
Return on Working Capital	.35
Subtotal	13.37
Royalty at 12½ percent	2.05
Production Taxes	1.01
Total	16.43

[32] This is computed as follows: The production investment is the sum of successful well costs, lease acquisition costs, and cost of

The Commission rounded this figure off at 16.5 cents for the Texas production. Because the New Mexico figure is exclusive of taxes a reduction of one cent was made in the New Mexico price.

For the costing of flowing gas the Commission used historical data developed by the industry questionnaires. The results may be summarized thus:

Production operating expenses	1.75 cents
Depreciation, depletion and amortization	2.42
Return at 12%	4.99
Exploration and development	4.08
Regulatory expense	.14
	13.38
State Production tax at 7%	1.01
	14.39[33]

This figure was rounded off at 14.5 cents for Texas and 13.5 cents for New Mexico. As a check on the method used the Commission backtrended the new gas-well gas figures and arrived at a 14.64-cent price.

The rates so established are subject to downward adjustment because of quality deficiencies and to both downward and upward adjustments on the basis of Btu content. The Commission disclaims any intent that the rate figures show producer costs. It says that the price of new gas-well gas is "geared" to costs derived from national statistics and the questionnaire data and that for flowing gas

---

other production facilities or a total of 3.95 cents. It is to be recouped over an average period of 10 years beginning an average of one year after investment. Accordingly, the return is allowed on an investment base 11 times the production investment of 3.95 cents per Mcf or 43.45 cents. 12% of this figure is 5.21 cents per Mcf.

[33] No separate item was included for royalty payments because costs were computed on 7/8 of actual volumes.

the "touchstone" is the historical price of Permian gas.[34] Other undefined and unidentified "factors" were taken into consideration.

9. **The Moratorium.**

The Commission implemented the price provisions of the decision in various ways. It imposed a moratorium on rate increases until January 1, 1968, "except in compliance with a specific order of the Commission for a rate as determined pursuant to said proceeding [AR61-1] or pursuant to later order of the Commission." The producers say this violates the Act because § 4 permits filings for rate increases. Section 4 must be read with other sections of the Act. Section 5 authorizes the Commission to determine the just and reasonable rate "to be thereafter observed and in force." Section 16 gives the Commission power to make such orders "as it may find necessary or appropriate to carry out the provisions of this act." In Callery the Court held that there was ample power under § 7(e) to impose a moratorium.[35] We believe that there is also ample power under §§ 5(a) and 16. The reasonableness of the exercise of the power is established by the need for price stability, the Commission's expressed willingness to reopen the proceedings to consider the propriety of changes, and the expiration date which is only about a year off.

10. **The Escalation Clauses.**

The Commission's order forbids the filing of rate changes in excess of applicable area rates when the contractual

---

[34] In Opinion No. 468 the Commission said: "Nevertheless, we make clear that we do not confine ourselves to a cost calculation in determining just and reasonable rates."

[35] 382 U.S. 223, 228.

right thereto is based on indefinite escalation clauses not permitted by § 154.93(a), (b), and (c) of the Regulations under the Natural Gas Act. The producers say that this provision destroys existing contract rights. The Commission replies that it has not proscribed the clauses but merely the right to file under them. This is a thin distinction. In Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F. 2d 241, 245, we upheld § 154.93 and pointed out that if a producer felt aggrieved thereby it could apply for a rule waiver under § 1.7(b) of the Commission's Rules of Practice and Procedure. We assume that a similar request could be made under the Permian order. When the request is made and rejected, the time will arrive for the consideration of the constitutional questions which the producers raise.

11. **The Commission's Fair Relationship Standard.**

In fixing the amounts of the area rates the Commission rejected the end result test and adopted a fair relationship standard. This appears clearly from Opinion No. 468-A. After disclaiming that it had made any finding that "jurisdictional revenues will equate to jurisdictional costs," the Commission said:

> "* * * we are convinced that the record fully justifies the Commission's judgment that the ceiling prices we have fixed 'provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur' in the Permian Basin."

Hope says that in the fixing of just and reasonable rates there must be a "balancing of the investor and the consumer interests."[36] It goes on to say that from the company point of view the revenue must not only provide operation expense but also capital costs including "service on the debt and

[36] 320 U.S. 591, 603.

dividends on the stock"; and that the return to the equity owner must be commensurate "with returns on investments in other enterprises having corresponding risks" and "sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital."[37] The Court concluded the discussion of this problem with the observation that in Hope the "end result" could not be condemned as unjust and unreasonable.

In Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 605, the Court, after referring to the Natural and Hope decisions said:

> "In those cases we held that the question for the courts when a rate order is challenged is whether the order viewed in its entirety and measured by its end results meets the requirements of the Act."

Also pertinent is the statement of the Court in Second Phillips that:[38]

> "To whatever extent the matter of costs may be a requisite element in rate regulation, we have no indication that the area method will fall short of statutory or constitutional standards. The Commission has stated in its opinion in this proceeding that the goal is to have rates based on the 'reasonable financial requirements of the industry' in each production area, * * * and we were advised at oral argument that composite cost-of-service data will be considered in the area rate proceedings."

Nothing in Second Phillips rejects the end result test of Hope. We believe that it applies here and that it is not satisfied by a finding of fair relationship. Something more than mere semantics is involved. The determination of a

---

[37] Ibid.

[38] 373 U.S. 294, 309-310.

fair rate from the standpoint of the consumers must depend to large extent on the informed judgment of the regulatory agency. In these proceedings no distributor, consumer interest, or consumer representative objects to the rates. They are accepted as just and reasonable.

From the standpoint of the producer the situation is different. It is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. These requirements must be tested against the record. They may not be brushed aside with a general finding of fair relationship. The Commission concedes that it did not equate jurisdictional costs to jurisdictional revenues. This is obvious because no determination was made of the jurisdictional revenues which the rates will produce.

12. **The High Cost Operator and the Small Producer.**

The Commission broke down the rates into components which it justified on averages based on national statistics and questionnaire data. We recognize that weighted averages and sifted averages are suspect.[39] We accept the principle that both the basic figures and the averages obtained therefrom must be typical and representative but we are not convinced that the Commission has misused its expertise in this technical field. It is self-evident that when average costs are used to compute ceiling prices, the high cost operator will be hurt and some low cost operators may receive windfalls. Probably to a greater extent than in any other comparable segment of the national economy the element of chance can affect the success or failure of even the most prudent entrepreneur who engages in the natural-gas business.

---

[39] See United States v. Abilene & Southern Railway Company, 265 U.S. 274, 291, and Interstate Commerce Commission v. Mechling, 330 U.S. 567, 583.

The problem of the high cost operator is characteristic of group or area rate making. The Supreme Court upheld group rates in Acker v. United States, 298 U.S. 426, 431, and commented that "regulation cannot be frustrated by a requirement that the rate be made to compensate extravagant or unnecessary costs." In Tagg Brothers v. United States, D.C. Neb. 29 F. 2d 750, 755, affirmed 280 U.S. 420, the court said that it was not necessary "to fix the rates so high that all agencies in the business would make money." Covington & Lexington Turnpike Road Company v. Sanford, 164 U.S. 578, 596, says that "the public cannot properly be subjected to unreasonable rates in order simply that stockholders may earn dividends."

The small producers, represented here by Big Chief Drilling Company, IPAA, Texas Independent Producers & Royalty Owners Association (TIPRO), J. C. Barnes, and others, join in the prediction that the Permian decision sounds the death knell of the small producers. Perhaps the flamboyant wildcatter must be replaced by the scientists of the industrial giants but the efforts of the boom-or-bust adventurers have contributed greatly to natural-gas discoveries. In its decision the Commission referred to the "smaller independent who traditionally drills much of the Permian exploratory acreage" and said that: "Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators who contribute a large share of the discoveries of new sources of gas."[40]

---

[40] Big Chief asserts that the small producers, although credited with only 20% of current production volumes, actually drill almost 40% of all successful gas wells and 50% of all successful exploratory gas wells.

The Commission took note of the suggestions that small producers should be exempt from regulation.[41] It found that outright exemption was neither necessary nor desirable but said that the small producers needed "special treatment." To this end it defined a small producer as "a natural gas company selling jurisdictionaly less than 10,000,000 Mcf annually on a nation-wide basis." They were granted relief from various requirements of §§ 7 and 4 and were freed from rate adjustments because of quality differentials. In our opinion the classification is reasonable and within the Act.

The small producers do not seek complete exemption. Their attitude is that such relief would be illusory rather than real because the pipelines would not pay more for gas supplied by them than the price paid to the major companies. Their complaint is that the Commission did not give adequate consideration to small producers' costs.

Data covering the costs of Permian producers came from questionnaires which are classified as Appendix B and Appendix C. The Appendix B group was mandatory for producers with company-wide jurisdictional sales of over 10 million Mcf and optional for others.[42] The Appendix C questionnaires went to the small producers. Forty-two of the majors and 25 of the small producers answered Appendix B. The response to the Appendix C questionnaires was sporadic. The Commission used only the material supplied by the majors saying that the inclusion of the data supplied by the small producers "does not affect the results."

---

[41] See statements of Justice Clark dissenting in Second Phillips, 373 U.S. 294, 329-330, and speaking for the Court in Federal Power Commission v. Hunt, 376 U.S. 515, 527.

[42] Appendix A pertained to well and drilling statistics. It is not pertinent here.

TIPRO and Big Chief both emphasize the testimony of a staff witness that the small producer questionnaire showed average unit costs 2 cents per Mcf higher than those of the majors. They argue that the end result standards must be applied not only to the entire group but to them as a group. The weakness of the argument is that once the whole group is split the process can be carried on until the regulation is back on an individual company basis.

We do not know the answer to the small producer problem. Superficially it seems unfair to fix ceiling prices for all producers, both large and small, on the basis of the costs of large producers only. The Commission rejected the small producer data because in its opinion the impact on the rate structure was de minimis. On the record presented, we are unwilling to say that this conclusion was erroneous as a matter of law.

In any regulation of the natural-gas industry on an area basis the high cost producers, be they majors or little fellows, are certain to be placed in a position less advantageous than that occupied by those whose good fortune and able management have supplied a lower cost base. We agree with the Commission that the expense items included in an individual cost-of-service are not the measure of a confiscatory rate. A producer has no constitutional right to be reimbursed for dry-hole expenses.[43] Also it has no obligation to remain in business by replenishing the supplies of gas which form the basis of present obligations. Inability to continue exploration and development is not confiscation. We conclude that the impact of the Permian rates on the high cost producers does not destroy the area rate method.

---

[43] Cf. Columbus Gas & Fuel Co. v. Public Utilities Commission of Ohio, 292 U.S. 398, 407.

13. **Gathering and Processing Costs.**

One subject of much discussion in the briefs is the allowance of the same rate for gas delivered at the tailgate of a processing plant and for gas delivered at the wellhead. Gathering lines cost money and have to be built and operated by someone. The Commission's position is that the revenues received for oil and oil products derived from condensation and processing return a profit which induces the building of the needed gathering lines and plants. Here again we reach the troublesome field of cost allocations between a regulated commodity, gas, and unregulated commodities, oil and liquified petroleum products.

Bass places particular emphasis on this phase of the case. It points to its extensive investments in gathering lines and plants and to its permanently certificated rate of 18 cents which, it says, the Commission has never specifically found unreasonable or discriminatory. The answer as we see it is that if area rates are proper no greater need exists for the consideration of the individual cost and revenue requirements in the case of Bass than in the case of the other producers. Perhaps in the future courts will have to explore the mysteries of allocations but we are not so inclined in this case. If in fact Bass and others similarly situated are confronted with confiscation, a way must be open for them to be heard.

14. **Special Exemptions.**

The Commission recognized that some provision must be made for special exemption from area rates. It said that when a producer's "out-of-pocket expenses in connection with the operation of a particular well are greater than the revenues under the applicable area price, he should be entitled to appropriate relief." It declined to "specify

all of the special circumstances which may serve as a basis for exceptions to the area rate" and observed that failure to earn exploration and development expenses plus the allowed return does not amount to confiscation. In regard to the form of relief it held that "it may be sufficient to permit them to abandon their unprofitable sales."

We agree with the Commission that an escape clause cannot be used to convert an area rate into an individual company cost-of-service rate but an escape clause which does no more than prevent an unconstitutional confiscation amounts to nothing. None is needed for that purpose. The producers are right in saying that the Commission's exemption provisions are so vague and nebulous that neither they nor a court can determine what relief is being granted. Out-of-pocket expenses are not defined and we do not know what they include. If a producer's accounting is on a lease rather than well basis, the facts relating to a particular well might not be determinable. It may be going too far to say categorically that individual producers should be permitted to show that the group costs are not typical or representative of their costs but in some instances that should be permitted. Conservation of gas is promoted if marginal wells are allowed to continue to produce but is discouraged if the same wells are shut down by a low price. Some producers furnish gathering facilities. Others sell at the wellhead and the pipelines pay for the gathering. Gathering costs are allowed pipelines. Perhaps in some instances they should be allowed to producers. An adequate savings clause should contain guidelines which if followed by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided. It is not enough to say in effect that confiscation will be prevented. Confiscation is an individual proposition and the individual is entitled

to be heard. We are convinced that the Commission's special exemption provisions are inadequate.

15. **Quality Standards.**

The Commission provided for adjustments in the area rates to reflect quality differentials. It said that "the price of gas cannot be related to volume alone but must be related to units of energy free of impurities and sufficiently compressed to enter the pipeline." Standards were fixed for content of carbon dioxide, hydrogen sulphide, total sulphur, water, and other impurities; and the amount of delivery pressure was established. The applicable base area rate is adjusted downward by the net cost of processing the gas to bring it up to standard. Provision is made for both an upward and a downward adjustment of rate depending on the Btu content. Quality statements are required to be filed together with an agreement by the seller and the buyer covering the cost of bringing the gas up to standard. If an agreement cannot be reached, each shall file a statement of its views on the processing costs.

About 90% of the flowing gas is substandard. We are cited to no figures on the similar percentage of new gas-well gas. The amount of the rate adjustments does not appear in the record because there was no evidence of the extent of quality differentials or of the processing costs of bringing the gas up to standard.[44] At oral argument various estimates were given as to the amount of rate reduction which would result from substandard quality. These were based on statements filed pursuant to the decision but after the record was closed. They ranged from .7 cents to 2.0 cents per Mcf. A spokesman for the Continental

[44] The Commission says in its brief that "appropriate price differentials or adjustments could not be made on the basis of the record."

Group said that on 1960 volumes a revenue deficiency of some $12 million a year would result. The Commission response in this court to the Skelly motion for stay of the Commission's orders herein said that the reductions in applicable rates because of adjustments for quality standards are expected to result in a revenue reduction of about $10 million annually.[45]

The producers' argument that the imposition of quality standards violates procedural due process because of lack of notice need not be resolved at this time. We are remanding the case and now everyone has notice. The matter of the Btu adjustments presents a particular problem which was emphasized by Commissioner O'Connor in his dissent. The price goes down if the Btu content is below 1,000 and goes up if it is above 1,050. The producers say the adjustment upward should begin at 1,000. We do not understand the Commission's reasons for the gap. On remand this can be clarified.

16. **The Rate of Return.**

The Commission says that the impact of the quality adjustments is taken care of in the rate of return which is made generous on this account. It fixed a rate of return of 12% on production activities and held that such rate "protects gas consumers against excessive prices but it is not so low that it fails to respond to the needs of the industry." The principles applicable to the determination of an appropriate return are set forth in Bluefield Water Works & Improvement Co. v. Public Service Commission, 262

---

[45] The statement was this: "It has been estimated that the reductions to the base rates alone will reduce the revenues from jurisdictional Permian sales by about $10 million annually. The adjustments for quality standards, which were substantially altered by Opinion 468-A * * * are expected to result in a further reduction of the same magnitude."

U.S. 679, 692-693. It "must be determined by the exercise of a fair and enlightened judgment, having regard to all relevant facts." The rates of a public utility should "permit it to earn a return on the value of the property * * * equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties" but the utility has no constitutional right to profits realized by "highly profitable enterprises or speculative ventures." The return should assure "confidence in the financial soundness of the utility" and be adequate under prudent management "to maintain and support its credit ad enable it to raise the money necessary for the proper discharge of its public duties." The Hope decision[46] states the same basic principles.

The Commission recognized these controlling principles. The objections of the producers are to the point that the allowed rate of return is inadequate to enable the industry to attain the goals which the principles contemplate. At this time there is no need for us to go into the comparisons of the returns appropriate for producers as opposed to pipelines or to the financing methods employed by either. The fact is that by treating quality deductions as a risk rather than a cost the Commission has made it impossible to determine the amount of return with any degree of certainty. The difficulty is that the record does not disclose the amount of deductions.

A fair rate of return cannot be ascertained with mathematical certainty.[47] Pragmatic adjustments may be made by an agency within the ambit of its statutory authority.[48]

---

[46] 320 U.S. 591, 603.

[47] Colorado Interstate Gas Co. v. Federal Power Commission, 10 Cir., 142 F. 2d 943, 961-962, affirmed 324 U.S. 581.

[48] Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 586.

A court must put great reliance on agency expertise in evaluating a rate of return but this does not mean that a court must accept the agency determination in blind faith. A producer is entitled to a higher rate of return than a pipeline because of the greater risk of the business. The Commission has here compounded the risk of discovery with the risk of substandard quality.

We believe that the price reductions to reflect quality deviations are an item of cost rather than an item of risk and should be directly reflected in the applicable base rates instead of hidden in a rate of return allowance. The amount of cost is the expense of bringing the quality up to standard. In the Permian Basin sound reason exists for this conclusion because of the known and substantial quality deficiencies particularly in flowing gas production. We find it hard to understand why a revenue deficiency in the estimated amount of $10 million annually should be classified as a risk and not a cost. A risk occurs as the result of unknown or unconsidered contingencies. In the Permian Basin it is known and considered that flowing gas falls short of pipeline standards. In any event, the lack of evidence as to quality deductions makes it impossible to determine whether the rate of return satisfies the Bluefield and Hope principles and we have no basis on which to appraise the allowance made by the Commission. We respect the expertise of the Commission but the conclusions reached by the use of expertise must accord with legal standards.

17. Contract Limitations.

The producers say that recovery of industry costs under the area rates is impossible because many of the existing contracts do not permit a producer to file for the flowing gas ceiling price of 14.5 cents. The Commission recognized that "there undoubtedly will be some contract prices

lower than the area rate ceiling, as adjusted for quality." Some of the producers estimate the deficiency because of contract limitations to be $14.4 million in the test year of 1960. The Commission has estimated that a reduction of base rates alone will result in a revenue reduction of about $10 million annually.[49]

It is elementary that gas prices are originally set by contract between the producer and the pipeline, that the producer may not raise the price unilaterally, and that any increase in price must be within contract terms unless the price is set so low as to affect the public interest. The Commission says that the producers are not entitled as a matter of right to collect contract rates that are higher than otherwise reasonable in order to offset other rates limited by contract to below maximum reasonable levels. Regulation does not guarantee an over-all profit;[50] relief from an unduly low rate may be given only if the rate is "so low as to adversely affect the public interest — as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory";[51] and a company's losses in one instance do not justify an illegal gain in another instance.[52] At the same time in such group procedures as the division of railroad rates the Interstate Commerce Commission, with court approval, has recognized that revenue from one source may balance that from another.[53]

---

[49] See supra, note 45.

[50] Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 590.

[51] Federal Power Commission v. Sierra Pacific Power Co., 350 U.S. 348, 355.

[52] Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, 153.

[53] See New England Divisions Case, 261 U.S. 184.

Contract limitations are one of the facts of life for the natural-gas industry. They are the outgrowth of the days when gas, which had previously been vented, flared, or capped, became salable to the newly constructed interstate pipelines. The pipelines wanted long-term contracts and the producers wanted to sell their gas. Prices were low. With the phenomenal increase in the use of gas as an energy source the prices rose. The producers whose contracts either contained no escalation clauses or clauses of the type proscribed by the Commission were in a disadvantageous position. Even permissible escalations do not, in many instances, bring the 1960 price up to the area ceiling. In Second Phillips the Court upheld the termination of certain § 4(e) dockets on the Commission's finding that "the annual increase in revenue produced by these increased rates was substantially less than the deficit for the test year 1954."[54] The same situation exists here for many companies. We do not know whether it exists for the area producers as a group because no finding was made of revenue and requirements. The Supreme Court has said that losses in one instance do not justify illegal gains in another. To us this means that the contract limitations do not preclude the establishment of a just and reasonable area rate. The answer is provision for a minimum rate.

The Commission held that "the establishment of minimum rates in this case is in the public interest and that the price impact on the consumer will be de minimis." It established a minimum rate of 9 cents per Mcf for gas of standard pipeline quality. We believe that the controlling question is whether the proper revenue requirements of the area producers as a group can be satisfied with rates having the ceiling and the floor which the Commission has fixed.

---

[54] 373 U.S. 294, 305.

This cannot be answered because the financial impact of the quality deductions is not ascertainable from the record.

18. **Refunds.**

The revenue deficiency argument of the producers leads directly to the refund issue. The Commission required "appropriate refunds in the case of rates which are the subject of proceedings under Section 4(e) of the Act, and have thus been collected subject to an obligation to refund amounts collected in excess of the just and reasonable rates as here determined." Procedures to accomplish this result were set up in detail.

The producers say that these individual company refunds are not proper because of the revenue deficiency of the industry. They say that in the test year of 1960 the producers in the area failed to meet their revenue requirements by $14.4 million and they estimate the refunds for that year under the Commission decision to approximate $6 million.

The Examiner held that refunds should be ordered only to the extent that over-all industry revenues exceed over-all industry expenditures in a given year. The Commission said that this theory was unworkable because it would result in inequities among both the buyers and the producers and because of "insurmountable" administrative difficulties. We are at a loss to understand how refund obligations, which might come into existence under the Examiner's approach, would be divided among the producers.

We see no escape from the requirement that refunds be on an individual company basis and on a schedule by-schedule basis. As we understand Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, 153, refunds are appropriate for each excessive rate re-

gardless of over-all revenues. The Commission has required refunds only on § 4(e) rate increases above the applicable area ceiling. If a producer claims that the refunds required of it are confiscatory or harmful to the public interest, it must have an opportunity to petition for special relief. A similar opportunity must be afforded if a producer can show that a refund is required for collections at or below the "last clean rate."[55] An adequate special exemption clause can take care of such situations.

19. **The End Result Test.**

This brings us back to the end result test. The Continental Group, which includes many large producers and major integrated oil companies and which is supported by Phillips, presents alternative arguments. The first is economic. It is said that regulation under the Act must be consistent with the economic characteristics of the industry; that this requires the establishment of market prices based on contracts; that a cost-based system of regulatory rates does not recognize the responsiveness of the gas supply to gas prices; and that a producer does not explore on the expectation of a return of its cost plus a return on its investment but on the hope of getting back many times what it expends as a reward for its gambler's risk. No doubt these are the economic facts of the industry.

The divorce of commodity value from costs was suggested by Justice Jackson in his dissent in Hope. He commented that a producer would have difficulty showing the invalidity of a fixed commodity value so long as it voluntarily continued to sell its product in interstate commerce.[56] One difficulty with this suggestion is that once the gas is

[55] By "last clean rate" is meant the last rate in effect pursuant to a permanent certificate not subject to any refund obligation.

[56] 320 U.S. 591, 652.

committed no withdrawal from interstate movement is possible without Commission approval.[57] A producer can stop exploration and development if it is dissatisfied with price but the interstate sales go on with a continuing impact of cost on price and of price on exploration and development. In any event the majority rejected the proposal and held that under the just and reasonable standard of the Act a regulated company is entitled to revenue for operating expenses and capital costs and to a return "commensurate with returns on investments in other enterprises having corresponding risks."[58] These standards cannot be met without consideration of costs and revenues. In our opinion the Hope construction of the statutory standard casts serious doubts on the validity of the adoption of a contract-based commodity value.

The alternate argument of the Continental Group is that if the rates are to be determined on a composite cost-of-service basis, the revenue requirements of the industry must be found and rates fixed to meet those requirements. In Second Phillips the Court particularly noted the assurance of the Commission that "composite cost-of-service data will be considered in the area rate proceedings."[59] Consideration of such data does not eliminate consideration of other factors. At the same time Second Phillips did not reject the end result test of Hope. Instead it quoted a portion of that opinion which said among other things that "it is the result reached not the method employed which is controlling."[60]

---

[57] Section 7(b) of the Act. See also Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 156.

[58] 320 U.S. 591, 603.

[59] 373 U.S. 294, 310.

[60] Id. at 309.

The Commission rejected both alternatives of the Continental Group. It said that commodity value established by contracts may not be used because of the absence of effective competition; and it emphasized that it took into consideration factors other than costs. The record does not disclose what these other factors were but they must have had some economic basis. The Commission held that its ceiling prices provided a "fair relationship" between consumer prices and producer costs. Fair relationship is pertinent but it is only part of the end result test. We do not know the producers' costs or revenue requirements. We do not know the economic factors which either require or permit departure from costs and revenues. The end result test is not satisfied by a reliance on unknowns.

We have accepted the Commission's conclusion that contract rates should not be used. The trouble is that the Commission decision rides two horses and we have no way of knowing the outcome of the race. It uses composite cost-of-service evidence, engrafts economic factors on top, and comes out with a rate which it justifies on a fair relationship basis. We have the problem of how in such circumstances a court can determine whether the just and reasonable standard of §§ 4 and 5 has been met. The answer is not found in the record before us.

The facts sustaining the conclusion of fair relationship must be found. The Commission did not make those findings and indeed it could not have done so because of the failure of the record to disclose the revenue impact of the adjustments in area rates to reflect quality differentials. Whether rate reductions because of quality deficiencies are a risk or a cost, the answer comes out the same. If they are a risk, we do not know the rate of return. If they are a cost, we do not know whether revenue received will equal the reasonable revenue requirements. We believe

that under Hope, and under Second Phillips, the area producers, as a group, are entitled to recover their prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. Satisfaction of this requirement must appear through appropriate findings based on substantial evidence. These cannot be made on the record presented. The decision of the Commission is not saved by the special exemption provisions which we find to be insufficient and unsatisfactory.

Rate making under the Act has produced a superabundance of delay and litigation. Much gas has moved through the pipelines since the First Phillips decision. We wonder if the time has not come for the establishmnt of a better rapport among the Commission, the consumers, the distributors, the pipelines, and the producers. Some practical means of resolving the economic and legal issues is highly desirable. The Commission has approved many settlements. The use of this procedure may well be explored further in an effort to obtain a true "balancing of the investor and the consumer interests."[61]

One point remains to be mentioned. Eleven motions for leave to adduce additional evidence were filed with us by various producers. We deferred all to the hearing on the merits. In view of the disposition which we make of the cases we see no reasons to explore evidentiary problems which may arise on remand. The Commission will hold such additional hearings as are needed to determine the effect of the quality adjustments, and to determine the group revenues and the group revenue requirements. It will make appropriate findings on these matters. The order based thereon shall contain an adequate provision for special ex-

---

[61] 320 U.S. 591, 603.

emptions. We decline to make advance rulings on the procedures to be followed or on the evidence to be received.

The motions to adduce additional evidence are severally denied. The petitions to review are severally granted and the cases are all remanded to the Commission for further proceedings consistent with this opinion.

APPENDIX B

JUDGMENT*

THIRTEENTH DAY, JANUARY TERM,
FRIDAY, JANUARY 20TH, 1967.

Before Honorable David T. Lewis, Honorable Jean S. Breitenstein and Honorable Delmas C. Hill, Circuit Judges.

No. 8493

CONTINENTAL OIL COMPANY, ET AL.,
Petitioners,

v.

FEDERAL POWER COMMISSION,
Respondent.

On Petition to Review an Order of the Federal Power Commission.

This cause came on to be heard on petition to review an order of the Federal Power Commission and motion to adduce additional evidence and was argued by counsel.

On consideration whereof, it is ordered by this court that the motion to adduce additional evidence is hereby denied. The petition to review is granted and the case is remanded to the Commission for further proceedings consistent with the opinion of the court.

---

* An identical judgment was entered in Tenth Circuit Cause No. 8505, Midhurst Oil Corporation v. Federal Power Commission. Midhurst Oil Corporation is also petitioner with Continental Oil Company in Cause No. 8493.

v.

FEDERAL POWER COMMISSION,

Respondent.

PETITION FOR A WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

The Superior Oil Company, Petitioner, prays that a writ of certiorari issue to review the judgment of the United States Court of Appeals for the Tenth Circuit entered in the above entitled case, *sub nom Skelly Oil Company, et al.*, Petitioners, v. *Federal Power Commission,* Respondent, Nos. 8385, *et al.* [No. 8510], on January 20, 1967. Other than the named Respondent, adverse parties hereto are The State of California, Public Utilities Commission of the State of California, City of Los Angeles, City of San Diego, City and County of San Francisco, Pacific Gas and Electric Company, Pacific Lighting Service and Supply Company, Southern California Gas Company, Southern Counties Gas Company of California, and San Diego Gas and Electric Company.

OPINIONS BELOW

The opinion of the Court of Appeals for the Tenth Circuit, *sub nom Skelly Oil Company, et al.,* Petitioners, v. *Federal Power Commission,* Respondent, Nos. 8385, *et al.* [No. 8510], is not yet officially reported. Said opinion is set forth in Appendix "B" hereto, P. 9a to 60a. The opinion and orders of the Federal Power Commission herein styled *Area Rate Proceeding, Docket Nos. AR61-1, et al.,* are reported at 34 FPC 159, with denials of rehearing and modifications at 34 FPC 1068, 1082, 1198, shown in the Joint Appendix (JA) printed for the use of the court below as follows: JA 277,554-277,800; 278,704-278,726; and 278,756-278,757.

JURISDICTION

The judgment of the Court of Appeals was entered January 20, 1967. Certain petitions for rehearing have been filed with that court and are now pending before it; however, they do not raise the issues here presented and their disposition will not affect this Petition. Jurisdiction of this Court is invoked under 28 U.S.C. Sec. 1254(1) and Section 19(b) of the *Natural Gas Act,* 15 U.S.C. 717r(b).

QUESTIONS PRESENTED

1. **Is there a constitutional or statutory bar to determination of just and reasonable rates for a natural gas company under the Natural Gas Act on the basis of group composited costs?**

2. **If the Natural Gas Act permits the fixing of rates for a natural gas company on the basis of composite cost determination for a group, does it not violate Art. I, Sec. 1, of the Constitution of the United States in that it fails to provide any standard whatsoever for the make-up of such group?**

3. **Where the regulatory agency without evidence or hearing selects a group of natural gas companies for regulation of the rates of each on the basis of group composite cost, and precludes any contention that the group selected may be inappropriate for such purpose, is not a natural gas company aggrieved by the rate so fixed for it deprived of due process of law under the Fifth Amendment to the Constitution?**

4. **Does a gas producer, regulated as a natural gas company under the Natural Gas Act, have a constitutional and statutory right to be reimbursed for all expenses, including dry hole expenses reasonably incurred in finding and producing natural gas sold subject to said act?**

CONSTITUTIONAL PROVISIONS AND STATUTES INVOLVED

The Constitutional provisions involved are Art. I, Sec. 1, of the *Constitution,* and the *Fifth Amendment to the Constitution,* The statute involved is the *Natural Gas Act,* June 21, 1938, c. 556, 52 Stat. 821-833, as amended, 15 U.S.C. 717-717w, and particularly Sections 2, 4, 5, 7 and 16 thereof. The pertinent portions of the respective provisions of the Constitution and the statute are set forth in Appendix "A" hereof.

STATEMENT OF THE CASE

This case presents for review questions decided by the Federal Power Commission (JA 277,567-277,755; 278,704-278,726; 278,754-278,757) arising under the *Natural Gas Act* (Act) as amended. Judicial review of the Commission order has been had under Section 19(b) of said *Act* before the Tenth Circuit Court of Appeals, Appendix "B", P. 9a et seq hereof.

This proceeding represents the Commission's first attempt at group rate fixing under said Act and presents for the first time this Court's opportunity for review of such effort. The companies selected for regulation as a group included all natural gas companies classified as independent producers under said *Act* making jurisdictional sales within any part of the so-called Permian Basin Area.

The geographical area, the so-called Permian Basin Area, encompassed separate pricing areas delineated in the *Commission's Statement of General Policy 61-1,* 24 FPC 818. It included (1) the so-called Permian Basin Area of New Mexico — three entire counties; (2) that in Texas Railroad Commission District 7-C — fourteen entire counties; and (3) that in Texas Railroad Commission District No. 8 — forty-one entire counties. The Policy Statement had recognized that the areas there established might ultimately be found inappropriate as pricing areas, 24 FPC 818, 819, although the guideline prices announced for the separate areas were the same.

The Commission order invoking this hearing specifically provided that issues or contentions that the geographical area selected, and the resulting group composition, were not appropriate for group rate making purposes would not be entertained because such consideration might delay the final determination of rates. Order issued December 23, 1960, (JA 268,203 at 268,204).

By subsequent Order of August 2, 1961 (JA 270,235-270,240) as amended January 11, 1962 (JA 273,253-273,255), the Commission directed Respondents to complete and submit certain data forms, i. e. Appendix A — "Operating Data" (all Respondents); Appendix B — "Cost and Statistics Pertaining to Oil and Gas Production, Exploration, Gas Gathering and Products Extraction Operations Year 1960"

(Respondents with companywide jurisdictional sales of 10 Million Mcf or more); and Appendix C—"Costs and Statistics Pertaining to Oil and Gas Production and Exploration—Small Producers, Year 1960", a simplified form of Appendix B as to which Respondents with companywide jurisdictional sales of less than 10 Million Mcf for 1960 might elect between "B" and "C". Order of April 5, 1961 (JA 269,877 at 269,879) specifically ruled that rate base cost of service studies for individual producers or groups of producers could not be introduced in evidence in this proceeding. See also Order of August 2, 1961 (JA 270,235 at 270,237) and Examiner's Opinion at JA 29,361-29,363. Compositing of the data from Appendices A, B and C was handled by Commission Staff[1] and the composited data was the "bedrock" for the rates here established, although other factors, such as need for a rate sufficient to elicit adequate exploration, and avoidance of abrupt departure from existing pricing patterns, if possible, were considered. (JA 277,602-277,603)

The Commission held that while Section 4(a) of the Act requires that all rates and charges of *any* natural gas company shall be just and reasonable, nothing in the Act states or suggests that such rates cannot be determined in a group or on an area basis rather than in individual proceedings; (JA 277,579), that constitutional restrictions and statutory powers should be considered in the light of the particular problem and what is necessary for a "sensible" result; (JA 277,581), that rates based on individual cost experience could be either too high for consumers in relation to other

[1] 361 Appendices A and B were mailed out, and approximately the same number of Appendix C. There were 249 responses to Appendix A, of which 220 were included in Commission Staff exhibits; 68 responses to Appendix B of which data from 67 were employed by Staff; and 105 responses to Appendix C of which data from 69 were used by Staff. (JA 274,576-274,578)

available supplies, or too low to be fair to the regulated producers considering their risks; that group cost based rates would be fair to all since profits in the aggregate would be at a reasonable level, although individual returns thereunder would vary greatly; (JA 277,582-3), other price regulatory acts do not require consideration of rates related to individual costs; (JA 277,579-277,581), and thus group rate fixing under this Act is legal.

The Court of Appeals affirmed the Commission on these matters. It acknowledged that a group fixed rate will establish rates which range from bonanza to bankruptcy for the several companies in the group but such effect was to be tolerated because of the actual necessities of procedure and administration here involved and must have been recognized as an inevitable result in *Wisconsin* v. *Phillips Petroleum Co.* (Second Phillips), Appendix "B", P. 32a hereof.

The court below held that no prior judicial decision had passed on the question of legality of group rate fixing under this *Act*,[2] but noted that group rate regulation had been sustained under other statutes.[3] The court assumed that the Congressional requirement for rate regulation must have intended use of a method by which that end could be attained and thus there was no abuse of discretion in here resorting to group price fixing since same was not specifi-

---

[2] Appendix "B", P. 28a hereof, pointing out that *Wisconsin* v. *Phillips Petroleum* (Second Phillips), 373 U.S. 294, 83 S. Ct. 1266 (1963), did not reach it nor did *United Gas Improvement* v. *Callery Properties, Inc., et al.* (Callery), 382 U.S. 223, 225-226, 86 S. Ct. 360; and holding that while *Bowles* v. *Willingham*, 321 U.S. 503, 517, 64 S. Ct. 641 (1944), held that individual rate making was required by the Natural Gas Act, such was dicta, the value of which was destroyed by *Second Phillips*.

[3] Appendix "B" hereof, P. 29a-30a *Interstate Commerce Act*, 49 U.S.C. § 15; *Packers & Stockyards Act of 1921*, 7 U.S.C. 181, et seq.; *Agricultural Marketing Agreement of 1937*, 7 U.S.C. 601, et seq.; *Bituminous Coal Conservation Act of 1937*, 15 U.S.C. 828-851; and state acts for regulation of insurance rates and control of milk prices.

cally prohibited by the *Act* and there was no constitutional obstacle to such method.

The court below further held that although the language of the *Act* in all pertinent clauses provided for regulation in the singular, Appendix "B", P. 30a, and was entirely silent on group rate fixing, nevertheless it contained sufficiently definite standards to allow the Commission to select groups for rate making and was not subject to objection under Art. I, Sec. 1, of the *Constitution* as an unfettered delegation of legislative power, particularly since it was unconvinced that the Commission order precluding contest of the grouping for price regulation denied the producers any specific right. Appendix "B", P. 33a, 34a hereof.

The court also held that the end result of a just and reasonable rate established under the *Act* must be a rate that produces revenues sufficient to cover operating expense, capital costs, including service on the debt and dividends on the stock of the regulated enterprise with a return to the equity owner commensurate with that from investment in other enterprises with corresponding risks and sufficient to assure confidence in the financial integrity of the enterprise and maintenance of its credit and ability to attract capital. Appendix "B", P. 33a, 41a, 42a hereof. It reversed the Commission decision for failing to find that the group rate here established was sufficient to meet the above end result test for the group. Appendix "B", P. 42a hereof. The court held that expense items and dry hole expenses which might be included in an individual cost of service for determination of lawful rates was not the measure of a confiscatory rate because a gas producer has no obligation to remain in business or replenish its committed gas supply, and therefore the adverse impact of a group fixed rate on high cost producers, even though inevitable, does not de-

stroy the area or group rate fixing method. Appendix "B", P. 46a hereof.

The further holding of the court below on particular matters such as the impact of quality adjustment on revenues under the ceiling rate; the Btu "gap" in quality adjustment; the uncertainty of rate of return allowed; and the special exemption established by the Commission; all of which were found not adequately nor properly handled by the Commission for which remand was required, are here omitted as not pertinent to the questions posed.

REASONS FOR GRANTING THE WRIT

I.

The issues here involve a number of important questions arising under the *United States Constitution* as related to this new construction of the *Natural Gas Act*, 52 Stat. 821-833 as amended, 15 U.S.C. 717-717w, which have not been, but should be, settled by this Court. The method of future rate regulation of all independent producers as to their gas sales subject to the *Act* is at issue.

Independent producers of natural gas who sell same in interstate commerce for resale have been held to be natural gas companies under the *Act*. *Phillips Petroleum Co.* v. *Wisconsin* (First Phillips), 347 U. S. 672, 678, 74 S. Ct. 794, 796 (1954). The *Act* provides a single standard of rate regulation for all natural gas companies subject to its terms.

As the court below recognized, this Court has never passed on the legality of group rate making under this *Act*.[4]

---

[4] *Second Phillips*, supra, expressly recognized that the matter was not there at issue, 373 U.S. 294, 308, 83 S. Ct. 1266, 1274 (1963):

> "The lawfulness of the area pricing methods are not themselves before the court for review", and further recognized the *right* of producers to a just and reasonable rate.

Every prior rate case under the *Act* has been based on findings that the rates therein established are just and reasonable for the particular natural gas company involved. The *Act*[5] condemns as unlawful rates for any natural gas company which are not just and reasonable and which are unduly discriminatory or preferential. Rates fixed by any regulatory method which provide a windfall for one or more producers at the expense of the bankruptcy of other producers appear unjust, unreasonable, unduly discriminatory and preferential on face value, and thus are prohibited by the Act.

In construing the *Act* to authorize group rate fixing Constitutional questions not present in proceedings determining rates on an individual basis are for the first time presented. It is respectfully submitted the court below has erroneously decided these questions.

Every pertinent section of the *Act* relating to rate regulation or certification of natural gas companies is couched in the singular number rather than the plural. This was recognized by the court below; notwithstanding it was held that since the *Act* did not in terms prohibit group rate fixing and the regulatory end sought could be most conveniently attained by such method, it was assumed to be permissible under *Sec. 16 of the Act,* Appendix "B", P. 31a, 33a hereof, permitting orders "necessary or appropriate to carry out the provisions" of the *Act.* This holding conflicts with the specific provision of Section 4(a) of the *Act* which requires that all rates of *any* natural gas company shall be just and

[4] (Cont)
"Surely, we cannot say that the rates to be developed in these [area] proceedings will in all likelihood be so high as to deprive consumers, or so low as to deprive producers, of their right to a just and reasonable rate." Id. P. 310, 1275; and *Callery,* supra, was a certificate case.

[5] Sections 4 and 5, Appendix "A", P. 2a-5a hereof.

reasonable, and that all other rates are unlawful. Violation of this unequivocal Congressional mandate is clear when it is conceded fact that the rates fixed by a group method will of necessity range from bonanza to bankruptcy for some companies affected. Such rates are either unreasonably high or unreasonably low for the particular members of the group and are not just and reasonable for any company in the group. The provision "any natural gas company" in common English means each and every natural gas company, or one indifferently out of a number. *Webster's New International Dictionary,* Second Edition, P. 121. See also *United States* v. *National City Lines,* 80 F. Suppl. 734, 741 (D.C. Calif. 1948).[6] Difficulty of administration in enforcing regulations under an act of Congress does not justify a procedural or administrative method which results in a violation of the Act itself. *National Labor Relations Board* v. *Brown,* 380 U. S. 278, 291, 292, 85 S. Ct. 980, 988 (1956). Furthermore, "The deference owed to an expert tribunal cannot be allowed to slip into a judicial inertia which results in the unauthorized assumption by an agency of major policy decisions properly made by Congress." *American Shipbuilding Co.* v. *N.L.R.B.,* 380 U. S. 300, 318, 85 S. Ct. 955, 967 (1956).[7]

The construction of the *Natural Gas Act* is not an open matter. It has been held constitutional on the ground that its standard for rate regulation — just and reasonable rates, not unduly discriminatory nor preferential — coincides with

---

[6] Cf. Here a statute, not the broad terms of a Constitution is involved. *Addison* v. *Holly Hill Fruit Products, Inc.,* 322 U.S. 607, 617; 64 S. Ct. 1215, 1221 (1944).

[7] Cf. *Social Security Board* v. *Nierotko,* 327 U.S. 358, 369, 66 S. Ct. 637, 643 (1946).
East Texas Motor Freight Lines, Inc. v. *Frozen Food Express,* 351 U.S. 49, 54, 76 S. Ct. 574, 577-578 (1956).
C.A.B. v. *Delta Air Lines, Inc.,* 367 U.S. 316, 322, 81 S. Ct. 1611, 1617 (1961).

the requirements of the Fifth Amendment to the *Constitution, Federal Power Commission* v. *Natural Gas Pipeline Company of America, et al.* (Natural), 315 U. S. 575, 62 S. Ct. 736, because in fact the lowest reasonable rate is a non-confiscatory rate. In *Federal Power Commission* v. *Hope Natural Gas Co.* (Hope), 320 U. S. 591, 64 S. Ct. 281, it was held that the Commission was not bound to use any single method of rate regulation but that whatever method chosen must yield as an end result a rate that is just and reasonable. Furthermore, to be just and reasonable it was held there must be a "balancing of the investor and consumer interest" in fixing the rate, and from "the company point of view" the rate must provide revenues sufficient to cover operating expenses, capital costs, and return on the investment sufficient for the enterprise to maintain credit and attract capital. The investor has a "legitimate concern" in the financial integrity of the company regulated, *Hope, supra* at P. 603. See also *Colorado Interstate Gas Co.* v. *Federal Power Commission,* (Colorado Interstate), 324 U. S. 581, 65 S. Ct. 829 (1945). The rule of *Hope* was reannounced by this Court in *Wisconsin* v. *Federal Power Commission* (Second Phillips), 373 U. S. 294, 83 S. Ct. 1266. There, considering the very proceeding here involved as a proposal only, the Court said it would not assume that any rate resulting would "be so high as to deprive consumers, or so low as to deprive producers of their right to a just and reasonable rate", id. at P. 310. A group fixed rate deprives both consumers and producers of the *right* to a just and reasonable rate provided for by Sec. 4 of the *Act* and guaranteed by the Constitution. Appendix "A", P. 1a, 2a hereof. The consumers served by the producer with the bonanza return pay an unreasonably high rate; on the other hand the producer with the bankruptcy rate has his property confiscated. The result this Court refused to assume would occur in its *Second Phillips* opinion has in fact occurred.

Resort to group rate fixing eliminates from the *Act* the only standard it contains for rate regulation. Such method obliterates entirely "a company point of view" for determination of whether the end result of the rate is just and reasonable. It becomes impossible to determine the legitimate interests of the investors in a regulated company or to assure that confidence in such a company's financial integrity is preserved. Investors exist only in companies, not groups of companies. Certainly no separate enterprise in a group has financial integrity simply because another enterprise in the same group is obtaining a bonanza rate.

II.

Recognition that the *Act* makes no provision for group rate fixing, *a fortiori,* concedes the total lack of any standard for the selection of groups for regulation. Thus, if construed to authorize group rate regulation, the *Act* itself is contrary to Art. 1, Sec. 1, of the *Constitution of the United States* which vests all legislative authority in Congress. This authority may not be abdicated, nor transferred without the laying down of policy and establishment of standards for such transfer. This Court so held in *Panama Refining Co.* v. *Ryan,* 293 U. S. 388, 421, 429-430, 55 S. Ct. 241, 242, 252 (1934).

III.

An untrammeled power to establish groups makes a mockery of the only regulatory standard contained in the *Act.* The make-up of any group predetermines the evidentiary data from which an ostensibly just and reasonable rate conclusion is to be made. The group here selected

consists of high cost producers and low cost producers,[8] the aggregate of whose costs determined the rate result. It is a simple matter of logic that the exclusion from the group of the most substantial producers with high costs would have seriously reduced the aggregate cost, and elimination of the most substantial low cost producers would have substantially raised the aggregate cost. The peculiar characteristics of this industry explain without contradiction that the high or low costs of particular members of the group are not the result of extravagance, unreasonable expenditures, or particular efficiency, Appendix "B", P. 31a, *infra*. No justification for their aggregation and regulation as a group is even offered. That the geographical area selected is a well known producing area is no answer, when the record shows that producing operations and depth of production within the area are widely disparate. (From 7,000′ in Nolan County, Texas, to 25,000′ in Reeves and Pecos Counties, Texas, and back up to 6,000′ in Culbertson County, Texas, with more than 2,000 separate producing fields, JA 103-104; and see JA 141-142 as to range of drilling costs at different depths.

Assuming *arguendo* that the Act permits group rate fixing, it then must by implication require that groupings employed be reasonable, and, so construed, Petitioner has here been deprived of due process of law. By specific Commission order it was precluded from offering contentions to show that the selected area was not an appropriate pricing unit, *supra* at P. 4. It was denied hearing on a mat-

[8] Unit gas-well-gas cost, per Staff Exhibit 329, ranged from 2.9¢ to 170.5¢ per Mcf based on Appendix B data for Respondents with sales in excess of 10 Million Mcf (JA 35,837) and from 3.8¢ to 134.5¢ per Mcf for Appendix B data for Respondents with sales less than 10 Million Mcf (JA 35,838). The absolute correctness of these unit cost figures is unimportant. On any consistent method of cost determination the range of costs between Respondents in this group will be in similar proportions.

ter that materially affected the final conclusion. In *Natural, supra,* it was held that "the first prerequisite to an order by the Commission is that it shall be preceded by a hearing and findings", 315 U.S. at P. 583, 584. As held by this Court in *Morgan* v. *United States,* 304 U.S. 1, 14-15, 58 S. Ct. 773, 775 (1938): The expansion of administrative regulation is made possible under our system by adherence to the basic principles that the "Legislature shall appropriately determine the standards of administrative action" and the rights of the parties shall be protected by "the rudimentary requirements of fair play. These demand a fair and open hearing" which is an "inexorable safeguard". It was held in *Baltimore & Ohio RR Co.* v. *United States,* 298 U.S. 349, 363, 56 S. Ct. 797 (1936): "There is no statute that can be held to limit trial of an issue of confiscation."

If under any circumstances group rate fixing is authorized, as a prerequisite it must at least be shown that the group data is typical and representative of the operations of the members of the group since the make-up of the group in large measure determines the composite result.[9] A reasonable group, therefore, can include only companies with production from the same or similar depths with wells drilled at approximately the same time, or with drilling costs adjusted for changes over time.

A grouping based on gas production obtained from drilling to similar depths at approximately the same time would greatly narrow the range in costs between companies in

---

[9] Should the Court see fit to grant this writ of certiorari Petitioner reserves the right to brief and argue the impropriety of the rates here derived on a group basis, their non-applicability to the operations of Petitioner, and the error of any requirement for refund by Petitioner, based on the rates established for the group, the costs of which are much below those of Petitioner.

the group. Then perhaps the express mandate of the *Act* that rates of each and every natural gas company shall be just and reasonable could be carried out. This would be accomplished by an *equitable division* of the group rate found just and reasonable among the high and low cost companies in the group.[10] Such division might permit the rates of any and all companies to be reasonable. This would avoid the windfall to some and bankruptcy to others, and give both consumers and producers the just and reasonable rate to which they have a right under Sec. 4(a) of the *Act*. Appendix "A", P. 2a hereof. This was hinted at, but not expressly required as it should have been, by the court below. Appendix "B", P. 53a hereof.

IV.

The holding of the court below that expense items, including dry hole expenses proper in an individual cost of service, are not the measure of a confiscatory rate is in conflict with prior decisions of this Court and of another Court of Appeals.

Natural, supra, held that the *Act's* "lowest reasonable rate" coincides with the Constitutional requirement of due process and just compensation preserved in the *Fifth Amendment. Hope, supra,* held that from a company point of view operation expenses and capital costs with return on investment commensurate with that in other enterprises with corresponding risks and sufficient to attract capital

[10] Such division is specifically provided for and required by the Interstate Commerce Act in respect to railroads, *The New England Division Case,* 261 U.S. 184, 43 S. Ct. 270 (1923). If group rate making under the *Natural Gas Act* is impliedly authorized because not specifically precluded, the implication for equitable division of rates is equally required from the Congressional provision that rates of any company must be just and reasonable and all other rates are unlawful.

must be obtained under a just and reasonable rate. The Fifth Circuit in *Forest Oil Company* v. *Federal Power Commission,* 263 F. 2d 622, 625, held that attraction of capital includes "the cost of finding potential fields as well as the drilling of dry wells that seem to be a necessary part of any continuing oil and gas business".

The *Act* does not contemplate that gas producers when subject to jurisdiction shall thereafter simply liquidate. The Commission here held that "continuing exploration and development of new reserves is necessary in the public interest". (JA 277,598).

Confiscation *vel non* is present in every rate determination under this *Act*. This Court should unequivocally reaffirm the rule announced in *Hope, supra,* and that of the Fifth Circuit, *supra.*

The case of *Columbus Gas and Fuel Co.* v. *Public Utilities Commission of Ohio,* 292 U. S. 398, 54 S. Ct. 763 (1934), relied on by the court below, does not support its decision on this point. The state statute there involved was struck down as being violative of the Fourteenth Amendment because it precluded allowance in operating expenses of "amortization of the value of leaseholds and wells and equipment thereon". The court further held:

> "When the allowance has been fixed and has been charged to operating expenses, it will supply the answer to other questions in controversy now * * * *." 292 U. S. at 406.

Here the question of *capitalizing,* rather than expensing, exploration costs was recognized by the Commission. Expensing was deemed proper to avoid departure from treatment in prior proceedings and industry accounting practices (JA 277,607-277,608). It was not doubted that such costs

must be recouped one way or the other under a just and reasonable rate.

CONCLUSION

The petition for a writ of certiorari should be granted.

Respectfully submitted,

APPENDIX

APPENDIX "A"

THE CONSTITUTION OF THE UNITED STATES OF AMERICA

ARTICLE I

Section 1

Legislative powers vested in Congress. — All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

AMENDMENTS TO THE CONSTITUTION OF THE UNITED STATES

ARTICLE V

Trials for crimes; just compensation for private property taken for public use. — No person shall be * * * * * deprived of life, liberty, or property, without due process of law, nor shall private property be taken for public use, without just compensation.

THE NATURAL GAS ACT

SEC. 2. When used in this act, unless the context otherwise requires —

(1) "Person" includes an individual or a corporation.

(2) "Corporation" includes any corporation, joint-stock company, partnership, association, business trust, organized group of persons, whether incorporated or not, receiver or receivers, trustee or trustees of any of the foregoing, but shall not include municipalities as hereinafter defined.

— — — —

(6) "Natural-gas company" means a person engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale.

— — — —

RATES AND CHARGES; SCHEDULES; SUSPENSION OF NEW RATES

SEC. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b) No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c) Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services.

(d) Unless the Commission otherwise orders, no change shall be made by any natural-gas company in any such rate, charge, classification, or service, or in any rule, regula-

tions, or contract relating thereto, except after thirty days' notice to the Commission and to the public. Such notice shall be given by filing with the Commission and keeping open for public inspection new schedules stating plainly the change or changes to be made in the schedule or schedules then in force and the time when the change or changes will go into effect. The Commission, for good cause shown, may allow changes to take effect without requiring the thirty days' notice herein provided for by an order specifying the changes so to be made and the time when they shall take effect and the manner in which they shall be filed and published.

(e) Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, State commission, or gas distributing company[1a] or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time when it would otherwise go into effect;[1a] and after full hearings, either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has

[1a] Subsection 4 (e) was amended May 21, 1962 by Public Law 87-454, 87th Congress, 2d Session [S. 1595], 76 Stat. 72.

not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natural-gas company to furnish a bond, to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and, upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas company, and the Commission shall give to the hearing and decision of such questions preference over other questions pending before it and decide the same as speedily as possible. [52 Stat. 822 (1938); 76 Stat. 72 (1962); 15 U.S.C. § 717c]

FIXING RATE AND CHARGES; DETERMINATION OF COST OF PRODUCTION OR TRANSPORTATION

SEC. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Com-

mission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,* That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural-gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural-gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

(b) The Commission upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas. [52 Stat. 823 (1938); 15 U.S.C. § 717d]

EXTENSION OF FACILITIES; ABANDONMENT OF SERVICE

SEC. 7. (a) Whenever the Commission, after notice and opportunity for hearing, finds such action necessary or desirable in the public interest, it may by order direct a natural-gas company to extend or improve its transportation facilities, to establish physical connection of its transportation facilities with the facilities of, and sell natural gas to, any person or municipality engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public, and for such purpose to extend its transportation facilities to communities immediately

adjacent to such facilities or to territory served by such natural-gas company, if the Commission finds that no undue burden will be placed upon such natural-gas company thereby: *Provided,* That the Commission shall have no authority to compel the enlargement of transportation facilities for such purposes, or to compel such natural-gas company to establish physical connection or sell natural gas when to do so would impair its ability to render adequate service to its customers. [52 Stat. 824 (1938); 15 U.S.C. § 717f (a)]

(b) No natural-gas company shall abandon all or any portion of its facilities subject to the jurisdiction of the Commission, or any service rendered by means of such facilities, without the permission and approval of the Commission first had and obtained, after due hearing, and a finding by the Commission that the available supply of natural gas is depleted to the extent that the continuance of service is unwarranted, or that the present or future public convenience or necessity permit such abandonment. [52 Stat. 824 (1938); 15 U. S. C. § 717f (b)]

(c)[2] No natural-gas company or person which will be a natural-gas company upon completion of any proposed construction or extension shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission, or undertake the construction or extension of any facilities therefor, or acquire or operate any such facilities or extensions thereof, unless there is in force with respect to such natural-gas company a certificate of public convenience and necessity issued by the Commission authorizing such acts or operations: *Provided, however,* That if any such natural-gas company or predecessor in interest was bonafide engaged in transportation or

ADMINISTRATION POWERS OF COMMISSION; RULES, REGULATIONS, AND ORDERS

SEC. 16. The Commission shall have power to perform any and all acts, and to prescribe, issue, make, amend, and rescind such orders, rules, and regulations as it may find necessary or appropriate to carry out the provisions of this act. Among other things, such rules and regulations may define accounting, technical, and trade terms used in this act; and may prescribe the form or forms of all statements, declarations, applications, and reports to be filed with the Commission, the information which they shall contain, and the time within which they shall be filed. Unless a different date is specified therein, rules and regulations of the Commission shall be effective thirty days after publication in the manner which the Commissoin shall prescribe. Orders of the Commission shall be effective on the date and in the manner which the Commission shall prescribe. For the purposes of its rules and regulations, the Commission may classify persons and matters within its jurisdiction and prescribe different requirements for different classes of persons or matters. All rules and regulations of the Commission shall be filed with its secretary and shall be kept open in convenient form for public inspection and examination during reasonable business hours. [52 Stat. 830 (1938); 15 U.S.C. § 717o]

ON PETITION TO REVIEW ORDERS
OF THE FEDERAL POWER COMMISSION

Sherman S. Poland for Skelly Oil Company, petitioner in No. 8385. With him on the brief were Hawley C. Kerr, Richard J. Dent, Bradford Ross, and Ross, Marsh & Foster. Kenneth Heady, Carroll L. Gilliam, Jesse H. Foster, Jr., Oliver L. Stone, James J. Flood, Jr., Bruce R. Merrill, and Warren M. Sparks for the petitioners in Nos. 8409, 8440, 8455, 8458, 8460, 8482, 8488, 8489, 8490, 8493, 8494, 8497, 8505, 8517, 8534, 8540, 8541, 8542, 8588, and 8589. With them on the briefs were:

Thomas H. Burton, Jr., and Joseph C. Johnson for Continental Oil Company;

J. P. Greve for Sunray DX Oil Company;

A. A. Davidson, Charles Holmes, and Charles E. McGee for Sinclair Oil & Gas Company;

Homer D. Johnson and Boyd D. Taylor for Cabot Corporation;

Dixon Morgan, McAfee, Hanning, Newcomer, Hazlett & Wheeler, and Richard F. Remmers for Sohio Petroleum Company;

Eldon E. Scott, Donald J. Mulvihill, and Cahill, Gordon, Reindel & Ohl for Joseph E. Seagram & Sons, Inc., and Joseph E. Seagram & Sons d/b/a Texas Pacific Oil Company;

H. Y. Rowe for Murphy Corporation;

Chester L. Wheless for The Nueces Company;

George N. Otey, Jr., for Samedan Oil Corporation;

John C. Snodgrass and Vinson, Elkins, Weems & Searls for Union Oil Company and as successor to The Pure Oil Company;

Clyde E. Willbern for Tidewater Oil Company;
T. J. Caldwell, Jr., and Jerome M. Alper for Reef Corporation;

Edward R. Hudson for William A. & Edward R. Hudson, Joint Operators;

All as joint and several petitioners in No. 8493;

Cecil N. Cook and Neal Powers, Jr., for Midhurst Oil Corporation, petitioner in Nos. 8493 and 8505;
Wm. J. Zeman, Lloyd G. Minter, John R. Rebman, and Stanley L. Cunningham for Phillips Petroleum Company, petitioner in No. 8409;

Donald R. Arnett and Kenneth C. Keener for Gulf Oil Corporation, petitioner in Nos. 8493 and 8534, and Warren Petroleum Corporation, petitioner in Nos. 8493 and 8440;

Cecil C. Cammack, R. J. Leithead, and Graydon D. Luthey for Cities Service Oil Company (formerly Cities Service Petroleum Company), Cities Service Production Company (now merged with Cities Service Oil Company), and Columbian Fuel Corporation, petitioners in No. 8493, and Coltexo Corporation and Columbian Carbon Company, petitioners in No. 8517;

Joseph W. Morris and Edwin S. Nail for Amerada Petroleum Corporation, petitioner in Nos. 8493 and 8542;

Tom P. Hamill, Robert D. Haworth, Donald G. Canuteson, and D. Lamar Smith for Mobil Oil Corporation (formerly Socony Mobil Oil Company, Inc.), petitioner

in Nos. 8455 and 8588, and Northern Natural Gas Producing Company, petitioner in No. 8460;

J. P. Hammond, T. C. McCorkle, William H. Emerson, and Clifford O. Stone, Jr., for Pan American Petroleum Corporation, petitioner in No. 8458;

William K. Tell, Jr., for Texaco Inc., petitioner in Nos. 8482 and 8541;

Carl Illig and William H. Holloway for Humble Oil & Refining Company, petitioner in No. 8488;

Thomas G. Johnson for Shell Oil Company, petitioner in No. 8489;

Stuart J. Scott, Bernard A. Foster, Jr., and Ross, Marsh & Foster for The Atlantic Richfield Company (formerly The Atlantic Refining Company), Southland Royalty Company, Westates Petroleum Company and Dorchester Gas Producing Company, petitioners in No. 8490, and The British-American Oil Producing Company, petitioner in No. 8497;

Clayton L. Orn, Joseph F. Diver, Morton Taylor, and Jack Fariss for Marathon Oil Company, petitioner in Nos. 8494 and 8540;

F. H. Pannill, Hamilton E. McRae, and Stubbeman, McRae, Sealy & Laughlin for J. C. Barnes, et al., petitioners in No. 8589.

Claude Proctor, Justin R. Wolf, Eugene E. Threadgill, and Wolf & Case were on the brief for Standard Oil Company of Texas, a Division of Chevron Oil Company, petitioner in No. 8479.

Robert W. Henderson for Hunt Oil Company, et al., petitioners in No. 8487. With him on the brief was Paul W. Hicks.

Louis Flax for Sun Oil Company, petitioner in No. 8495. With him on the brief were Phillip D. Endom, Robert E. May, and May, Shannon and Morley.

William I. Powell for Independent Petroleum Association of America, petitioner in No. 8496. With him on the brief was L. Dan Jones.

H. W. Varner for Superior Oil Company, petitioner in No. 8510. With him on the brief was Murray Christian.

J. Evans Attwell for Perry R. Bass, et al., petitioners in No. 8511. With him on the brief were W. H. Drushel, Jr., and Vinson, Elkins, Weems & Searls.

Waggoner Carr, Attorney General, for the State of Texas, petitioner in No. 8519. With him on the brief were Hawthorne Phillips, First Assistant Attorney General, T. B. Wright, Executive Assistant, J. Arthur Sandlin, C. Daniel Jones, Jr., and Linward Shivers, Assistant Attorneys General, of the State of Texas.

Lewis G. Mosburg, Jr., for Big Chief Drilling Company, et al., petitioners in No. 8521. With him on the brief were A. P. Murrah, Jr., Leland C. Neeley, Jr., Mosteller, Andrews & Mosburg, Jerry F. Lyons, and Underwood, Wilson, Sutton, Heare & Berry.

John Davenport for Texas Independent Producers & Royalty Owners Association and West Central Texas Oil and Gas Association, petitioners in No. 8528.

Boston E. Witt, Attorney General, and William J. Cooley, Special Assistant Attorney General, for the State of New Mexico, petitioner in No. 8529.

Richard A. Solomon, General Counsel, and Peter H. Schiff, Deputy Solicitor, Federal Power Commission, for the respondent. With them on the brief were Howard E. Wah-

renbrock, Solicitor, Leo E. Forquer, David J. Bardin, Assistant General Counsels, Alan J. Roth, and James D. Annett, Attorneys, Federal Power Commission.

J. Calvin Simpson, Senior Counsel, for People of the State of California, Public Utilities Commission of the State of California, City of Los Angeles, City of San Diego, and City and County of San Francisco, intervenors. With him on the brief were:

Mary Moran Pajalich, Chief Counsel, and William N. Foley, Associate Counsel, for the People of the State of California and Public Utilities Commission of the State of California;

Roger Arnebergh, City Attorney, for the City of Los Angeles;

Edward T. Butler, City Attorney, and Edwin L. Miller, Jr., Assistant City Attorney, for the City of San Diego;

Thomas M. O'Connor, City Attorney, William F. Bourne, Public Utilities Counsel and Deputy City Attorney, and McMorris M. Dow, Deputy City Attorney, for the City and County of San Francisco.

William L. Cole, Malcolm H. Furbush, and C. Hayden Ames for Pacific Gas and Electric Company, Pacific Lighting Service and Supply Company (formerly Pacific Lighting Gas Supply Company), San Diego Gas & Electric Company, Southern California Gas Company and Southern Counties Gas Company of California, intervenors. With them on the brief were:

John Ormasa and Roger J. Nichols for Pacific Lighting Service and Supply Company, Southern California Gas Company, and Southern Counties Gas Company of California;

Frederick T. Searls and Stanley T. Skinner for Pacific Gas and Electric Company;

Sherman Chickering and Donald J. Richardson, Jr., for San Diego Gas & Electric Company.

A brief Amicus Curiae supporting respondent was filed by J. David Mann, Jr., John E. Holtzinger, Jr., Frederick Moring, and Morgan, Lewis & Bockius on behalf of the Associated Gas Distributors Group.

Oklahoma Independent Petroleum Association, A & R Pipe Co., et al., Panhandle Producers & Royalty Owners Association, and Malouf Abraham Company, et al., joined in the brief of Big Chief Drilling Company, et al., as Amicus Curiae supporting petitioners.

Before LEWIS, BREITENSTEIN and HILL,
Circuit Judges.

BREITENSTEIN, Circuit Judge.

The first area rate decision of the Federal Power Commission is before us for review. It relates to prices for jurisdictional sales of natural gas produced in the Permian Basin, a famous petroleum area where oil and gas are found in hundreds of reservoirs and thousands of wells. The states of Texas and New Mexico, the nation's oil and gas industry, and several related associations attack the decision. The State of California, the cities of San Francisco, Los Angeles, and San Diego, various local distributors, and an organization of such distributors support it. The rejection of the individual company cost-of-service approach to the regulation of independent producers and the adoption of the area rate method raise many novel issues which have been extensively and ably argued. We hold that neither the United States Constitution nor the Natural Gas Act bars the regulation of natural-gas prices on an area basis; that the Commission did not abuse its discretion in adopting the area method; and that the cases must be remanded because the actions of the Commission do not comply with the end result test established in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602-603, and other decisions.

The petitions for review, all brought under § 19(b) of the Natural Gas Act,[1] attack Opinions Nos. 468 and 468-A of the Commission fixing just and reasonable rates under

---

[1] 15 U.S.C. §§ 717-717w.

§§ 4 and 5 of the Act for natural gas produced in the Permian Basin and sold to interstate pipeline companies.

1. **Background.**

The Permian Basin, as defined by the Commission, includes Texas Railroad Commission Districts Nos. 7-C, 8, and 8-A and the New Mexico counties of Chaves, Eddy, and Lea. Nationally, it accounts for about 11% of all the gas sold in interstate commerce. The Commission joined 336 producers as respondents in the consolidated proceedings. Sales by them are made to three interstate pipelines, none of which appear here.[2] About 85% of the Permian gas moving interstate goes to California.

Nearly two-thirds of the Permian gas production comes from oil-well gas, that is, gas produced in conjunction with oil. Because of impurities much of the gas must be processed before introduction to an interstate pipeline. Until El Paso began its purchases, Permian oil-well gas was generally vented or flared because of the lack of a market.

The natural-gas industry has three main parts, the producers, the interstate pipelines, and the distributors. The last are under state or local regulation exclusively. The Commission began federal regulation of the interstate pipelines after the passage of the Natural Gas Act of 1938. It did not attempt to regulate independent producers[3] until the 1954 decision of the Supreme Court in Phillips Petro-

---

[2] El Paso Natural Gas Company began buying Permian gas in 1945, Northern Natural Gas Company through a predecessor in 1954, and Transwestern Pipeline Company in 1958. In 1961, El Paso purchased 73% of the Permian gas moving in interstate commerce, Northern 18%, and Transwestern 9%.

[3] The word "independent" is used to describe a producer which does not transmit gas interstate either by its own operations or those of an affiliate. Some of the interstate pipelines produce a share of their own gas and sell gas to other pipelines.

leum Co. v. Wisconsin, 347 U.S. 672, (First Phillips) which held that the Act applied to them.

Section 7 of the Act forbids the sale of natural gas subject to Commission jurisdiction without a certificate of public convenience and necessity granted after notice and hearing. Temporary certificates, issued without notice and hearing, are authorized. Our recent decision in Sunray DX Oil Company v. Federal Power Commission, 10 Cir., ..., F. 2d ....., discusses § 7 procedures and problems. These are not present here because the § 7 applications considered in the consolidated proceedings before the Commission were disposed of in a separate order.

Section 4 requires that all rates shall be just, reasonable, and nondiscriminatory. No change shall be made in a rate without 30 days' notice. When a schedule containing a changed rate is filed, the Commission on its own initiative or on complaint may suspend the rate and set the matter for hearing. The suspension may be for not longer than five months. If no decision is reached within that period, the increased rate becomes effective but the Commission may require a bond conditioned upon the refund of that portion of the increased rate found not to be justified. The instant proceedings involve a number of increased rate filings which were suspended under § 4 and which were disposed of by Opinions Nos. 468 and 468-A.

Section 5 provides that whenever the Commission, after hearing had on its own motion or on complaint, finds that a rate is "unjust, unreasonable, unduly discriminatory, or preferential" it shall determine "the just and reasonable rate." In the proceedings at bar the Commission pursuant to § 5 established "the future rates for jurisdictional sales of gas by producers in the area."

After the First Phillips decision the Commission received thousands of certificate applications from producers. The situation was complicated by the need of pipelines for a committed source of supply sufficient to justify financing. To obtain such supply long-term contracts, commonly for 20 years, were made with the producers. They in turn, because they could not file unilaterally for an increased rate contrary to contract and because they desired protection against the unforeseeable economic conditions of the future, insisted on escalation clauses of various types.[4] A general price rise occurred. As the escalation provisions became operative the producers filed under § 4 for increased rates and the Commission suspended many of them. Section 7 applications were under contracts calling for rates comparable to those which the Commission had suspended. This trend was ended by the 1959 decision in Atlantic Refining Co. v. Public Service Commission of New York, 360 U.S. 378, (CATCO) which directed the Commission in certificate cases to keep initial prices in line.

After the remand in First Phillips, the Commission proceeded with the consideration of just and reasonable rates required by §§ 4 and 5 on the individual company cost-of-service basis which it had long applied in the regulation of electric power companies and interstate pipelines. The first case to reach the decisional stage was that relating to Phillips. On September 28, 1960, the Commission entered Opinion No. 338[5] in which it held that the regulation of independent producers under the Act could be accomplished more appropriately by the establishment of area rates than by the establishment of producer rates on individual cost-of-service findings. Contemporaneously with this Phillips

---

[5] 24 FPC 537.

decision, the Commission promulgated its Statement of General Policy No. 61-1[6] which established 23 rate areas and, with unimportant exceptions, announced maximum rates for each area. Two price standards were set, one for initial prices in new contracts and one for escalated prices in existing contracts. For the Permian Basin area the prices were 16 cents and 11 cents respectively.

Opinion No. 338 was affirmed by the Court of Appeals for the District of Columbia Circuit[7] and by the Supreme Court in Wisconsin v. Federal Power Commission, 373 U.S. 294, 310, (Second Phillips) wherein the Court observed that it shared "the Commission's hopes that the area approach may prove to be the ultimate solution" to the problem of regulating the independent producers.

The first area rate proceeding was that for the Permian Basin and was initiated on December 23, 1960.[8] It was followed by a similar proceeding for the South Louisiana area,[9] for the Hugoton-Anadarko area,[10] and for the Texas Gulf Coast area.[11] The last three are in the hearing stage. The Permian Basin proceeding was decided by Opinions Nos. 468 and 468-A to which we turn.

2. The Decision of the Commission.

The 131-page original opinion, No. 468, followed by the 23-page opinion denying rehearing, No. 468-A, need only be summarized at this point. The Commission found the area rate principle free from constitutional and statutory

objections and adopted it. Contract prices were rejected as a basis for regulation and the reserves to production ratio was declared to be an inappropriate regulatory standard. The Commission set up a two-price system. It differentiated between gas produced as the sole product of a well, referred to as gas-well gas, and gas produced in association with oil, known as oil-well gas or casinghead gas. One price was established for new gas-well gas and the residue therefrom sold under contracts made on or after January 1, 1961. A second price was established for flowing gas which was defined to include gas-well gas sold under contracts executed before the mentioned date, casinghead gas, and residue gas derived from either source. The January 1, 1961, date of division between new gas-well gas and oil gas-well gas was adopted because that was the approximate date when the industry became able to direct its exploration efforts toward finding gas-well gas as distinguished from finding gas as a by-product in the search for oil. For new gas-well gas the Commission fixed a rate of 16.5 cents per Mcf for the Texas Railroad Districts inclusive of state and local taxes and a rate of 15.5 cents per Mcf for the New Mexico counties exclusive of applicable state and local production taxes. For flowing gas the respective rates were 14.5 cents and 13.5 cents.

In determining these rates the Commission gave consideration to composite costs but treated the two categories of new gas-well gas and flowing gas differently. It said that the price of the former "was geared to the cost of finding and producing future gas supplies and as such was built up primarily from nationally published statistics and the questionnaire data." For flowing gas it said "our touchstone is the historical cost of gas being produced in the Permian Basin area."

The Commission required adjustment on an individual company basis from the stated prices to reflect differentials from the quality standards. These downward adjustments are determined "by the net cost of processing the gas to bring it up to standard." A downward adjustment is also required if the Btu content is less than 1,000 per Mcf and an upward adjustment is permitted if that content is above 1,050.

Small producers, defined as those making less than 10 million Mcf of jurisdictional sales annually, are exempt from the quality adjustments and from certain filing requirements.

The Commission set a minimum price of 9.0 cents per Mcf. Provision is made for special exemption from area rates. Refunds of excess collections are required on an individual company basis. The possibility of changes in area rates is recognized. A moratorium, until January 1, 1968, is declared on rate increases and indefinite escalation clauses are prohibited.

Three commissioners filed separate opinions. With one exception Commissioner O'Connor approved the results reached but said that "the contract price at which most producers are able and willing to operate is just and reasonable" and that "composite costs best serve as a check on average field prices to preclude significant price departures." He disapproved the Btu adjustment saying that an upward adjustment should be applied for all gas having a Btu content in excess of 1,000. Comissioner Ross was critical of accounting methods used and pointed out the need for simplification. He dissented from the division date between new and old gas-well gas. In his view the new gas-well gas price should apply to gas sold after the date of the Commission decision. Commissioner Black said that the allowed 12% rate of return on net investment "is

very probably a generous one" but was justified by the special risk of finding substandard gas in the Permian Basin.

3. Disqualification of Two Commissioners.

The Continental Group of petitioners urges that Commissioner Black was disqualified to participate in the decision. The Independent Petroleum Association of America, (IPAA) complains of the participation of both Commissioners Swidler and Black. The claim is that each of them had prejudged the issue of whether substantial competition existed among producers. Additionally, Commissioner Black is accused of personal bias against the producers. The charges stem from public addresses made in 1964.[12] No claim is made that either commissioner prejudged the ultimate issue of a just and reasonable rate. In our opinion no basis for disqualification arises from the fact or assumption that a member of an administrative agency enters a proceeding with advance views on important economic matters in issue. Nothing in the record disturbs the assumption that the two commissioners are "men of conscience and intellectual discipline, capable of judging a particular controversy fairly on the basis of its own circumstances."[13] The cases cited by Continental and IPAA are not in point.[14]

---

[12] A motion for the disqualification of Commissioner Black was made to and denied by the Commission. We find no similar motion in the record pertaining to Commissioner Swidler.

[13] United States v. Morgan, 313 U.S. 409, 421. See also Federal Trade Commission v. Cement Institute, 333 U.S. 683, 700-703.

[14] In Texaco, Inc., v. Federal Trade Commission, D.C. Cir., 336 F. 2d 754, vacated 381 U.S. 739, the charge was precommitment of a commissioner on the guilt of an accused. In Gilligan, Will & Co. v. Securities and Exchange Commission, 2 Cir., 267 F. 2d 461, certiorari denied 361 U.S. 896, a similar charge was made

4. Objections of Texas and New Mexico.

The states of Texas and New Mexico, besides adopting the briefs and arguments of the Continental Group, assail the Commission decision on grounds peculiar to them in their governmental capacity. They say that the public interest, which the Commission is required to protect, includes the producing states as well as the consuming states; that the prices which the Commission has set will cause a cessation or curtailment of exploration and development activities to the serious injury of the economy of the Permian Basin; that waste rather than conservation of a natural resource will result; and that the states and their public entities will suffer severe losses in taxes and royalty payments.[15] Similar arguments were made by West Virginia in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 607-614, and were rejected by the Supreme Court which said that when Congress passed the Natural Gas Act it "was quite aware of the interests of the producing states in their natural gas supplies" and that nothing in the Act intimates that high prices should be maintained so that "the producing states obtain indirect benefits." The rejection of the state's contentions in Hope requires the rejection of the same contentions here.

Texas and New Mexico also argue that the Commission has unlawfully interfered with their power of taxation.

---

against a commission. Amos Treat & Co. v. Securities and Exchange Commission, D.C. Cir., 306 F. 2d 260, related to a charge against a commissioner who had previously served as a staff member in the investigation which led to the complaint.

[15] In Texas 4.7 million acres of public lands are within the Permian Basin and in New Mexico over 3 million acres. Much of this land is leased for oil and gas and produces royalty income.

The Commission fixed the rates of gas produced in Texas to include all state taxes and in New Mexico to exclude such taxes. It said that: "In the event of any increase in taxes in Texas or New Mexico, the Commission will consider whether ceiling prices shall be increased and, if so, to what extent." The states' arguments are premature. The Commission has allowed all present taxes as a cost item. Nothing in the Commission decision inhibits the states from increasing those taxes. The Commission has said that if they do, it will determine whether such increases should be passed on to the consumer or remain on the shoulders of the producers. The question of whether increased state taxes will unreasonably burden interstate commerce is hypothetical at this stage.

New Mexico complains that the establishment of a ceiling price plus existing taxes for gas produced in its portion of the Permian Basin denies to it the power to provide a tax incentive to producers by reducing the tax. The argument is not persuasive. If the New Mexico tax was reduced, the Commission could properly consider a rate decrease to reflect the tax decrease.

5. Legality of Area Rates for Permian Basin.

The problems confronting federal regulation of the natural-gas business, and particularly the independent producers, have been discussed several times[16] and need be only summarized. The interstate gas business is concerned with a wasting, nonreplenishable natural resource subject to production after discovery. At the point where the gas enters interstate commerce there are few buyers and thou-

---

[16] See opinions of Justice Jackson dissenting in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 628, and concurring in Colorado Interstate Gas Co. v. Federal Power

sands of sellers. The producers range from the financially powerful integrated oil companies to the wildcatters who operate on a shoestring. Their results are measured by the amount of gas produced — not by the amount of money invested. Exploration and development costs are financed out of current income and are charged to expense rather than capital. The uncertainty of the business causes substantial cost and revenue fluctuations not only from producer to producer but also from year to year for the same producer. A regulated commodity, gas, is produced in substantial quantities along with an unregulated commodity, oil. The allocation of costs between them baffles the experts and presents the temptation to use mathematical means of arriving at a predetermined result. The same rate may bring a financial windfall to one producer and a financial disaster to another. The price of gas must be competitive with that of other sources of energy and must be sufficienlty attractive to encourage a continued search for new supplies.

In Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 582, a case relating to pipeline rates, the Court held that the provisions of the Act were consistent with the due process clause of the Fifth Amendment and within the commerce power. Another pipeline case, Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602, says that in fixing rates the Commission is "not bound by the use of any single formula or

---

Commission, 324 U.S. 581, 608; dissenting opinion of Justice Douglas in First Phillips, 347 U.S. 672, 687; dissenting opinions of Justice Clark in First Phillips, 347 U.S. 672, 690, and in Second Phillips, 373 U.S. 294, 315; dissenting opinion of Justice Harlan in Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 159; and Opinion No. 338 of the Commission, 24 FPC 537, 542-548.

combination of formulae"; that "under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling"; and that the impact of the rate order rather than the theory behind it is the governing criterion. The "end result" test of Hope was followed in Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 605-606.

Second Phillips, 373 U.S. 294, holds that the Commission did not abuse its discretion in terminating the § 5 investigation of Phillips' rates and substituting an area basis for an individual company basis. The Court reaffirmed the principles announced in Natural, Hope, and Colorado Interstate, recognized the difficulties inherent in the regulation of the price of natural gas, shared the Commission's hope for the success of the area approach, and observed that the "case might be different if the area approach had little or no chance of being sustained."[17] At the same time, the Court pointed out that "the lawfulness of the area pricing method" was not before it for review.[18] Four justices dissented in an opinion which characterized the area rate policy of the Commission as "a new, untried, untested, inchoate program which, in addition, is of doubtful legality."[19]

In Callery[20] the Court mentioned that the § 7 proceedings before it had at one time been consolidated with the South Louisiana area rate proceedings. Contrary to the argument of the California Distributors the Court did not, tacitly or otherwise, approve area rate regulation. The

most pertinent comment is that of Justice Harlan in his concurring and dissenting opinion who said that area pricing "ultimately aims to simplify proceedings under the statute."[20a]

We cannot accept the arguments of the Commission and the California groups that the Supreme Court has determined the validity of area pricing under the Act. We read the decisions to mean that the Court has permitted the Commision to go forward with the area rate experiment and wishes it good luck in the development of a workable procedure which will be free from constitutional and statutory pitfalls.

Governmental price regulation of services and commodities on a group or geographical basis has been upheld in a number of decisions[21] under the federal commerce and war powers and under state police powers. Those supporting the Commission place great reliance on these decisions. The producers painstakingly distinguish each from the case at bar. We decline to be drawn into these tortuous sidepaths because we are convinced that the "translation of an impli-

---

[20a] Id. at 231.

[21] See The New England Divisions Case, 261 U.S. 184 (ICC — divisions of joint rates); Aetna Insurance Co. v. Hyde, 275 U.S. 440 (Missouri regulation of fire insurance rates); Tagg Bros. v. United States, 280 U.S. 420 (Packers and Stockyards Act of 1921); Nebbia v. New York, 291 U.S. 502 (New York Milk Control Act); United States v. Rock Royal Co-op., 307 U.S. 533 (Agricultural Marketing Agreement Act of 1937); Sunshine Anthracite Coal Co. v. Adkins, 310 U.S. 381 (Bituminus Coal Conservation Act); Bowles v. Willingham, 321 U.S. 503 (Emergency Price Control Act of 1942); New York v. United States, 331 U.S. 284 (ICC — railroad rates); and Ayrshire Collieries Corp. v. United States, 335 U.S. 573 (ICC — railroad rates).

cation drawn from the special aspects of one statute to a totally different statute is treacherous business,"[22] Specific reference need be made to only one decision. Several producers emphasize the statement in Bowles v. Willingham, 321 U.S. 503, 517, that in the Natural Gas Act "Congress has provided for the fixing of rates which are just and reasonable in their application to particular persons or companies." The argument is that by this language the Supreme Court has recognized that regulation under the Act is on an individual company rather than group basis. We do not agree. The statement is dicta and whatever value it might have had as dicta was, in our opinion, destroyed by the blessing which the Court gave area rate making in Second Phillips.

Producers urge that the language of the Act is contrary to regulation on a group basis because all pertinent references to natural-gas companies are in the singular. First Phillips holds that an independent producer is a "natural-gas company" within the purview of the Act. Section 2, the definitions section, provides that "person" means an individual or corporation, and defines "natural-gas company" to mean a person engaged in transportation or sale of natural gas in interstate commerce. Section 4, covering the filing and changing of rates, refers to "any natural-gas company," "no natural-gas company," "every natural-gas company," and "the natural-gas company." Section 5, authorizing investigation and determination of rates, refers to "any rate," by "any natural-gas company" and to "such natural-gas company." Section 7 provides for certificates of public convenience and necessity and uses the terms "a natural-gas company," "no natural-gas company" and "such natural-gas company." The repeated use of the singular

---

[22] Federal Trade Commission v. Bunte Bros., 312 U.S. 349, 353.

rather than the plural is said to require that the just and reasonable rate of each particular seller be tested with reference to its peculiar circumstances and operations.

Opposing arguments point out that the Act does not prohibit group or area rate making and that § 16 empowers the Commission to perform any and all acts and to prescribe such orders, rules, and regulations "as it may find necessary or appropriate to carry out the provisions of this act."

The basic query is whether the just and reasonable standard applies on an individual company basis or on a group basis. Section 4(a) says that "all rates * * * made * * * by any natural-gas company * * * shall be just and reasonable * * *." If this means that each producer is entitled to a rate which will return its costs plus a reasonable profit, the inquiry is at an end because the Commission refused to receive individual cost figures.

The Natural, Hope, Colorado Interstate, and Second Phillips decisions all support the conclusion that in the regulation of natural-gas rates the Commission is not bound by any formula or method, and that the choice of the appropriate method for the determination of those rates lies in the sound discretion of the Commission. The appropriateness of the method depends on the peculiar characteristics of the natural-gas industry.

In its Opinion No. 338,[23] the Commission noted the reasons why the individual company cost-of-service method was inapplicable and unworkable. Among these were the lack of a fixed determinable relationship between investment and service to the public with the result that "a huge investment might yield only a trickle of gas, while a small investment might lead to a bonanza," the staggering allocation problems which could result in such anomalies as

[23] 24 FPC 537.

widely varying prices for gas coming from a jointly owned lease or even from a jointly owned well, and the intolerable administrative burden of requiring a separate rate determination for each of the several thousand independent producers.

The powerful contrary argument is that no area rate, whether based on composite costs, average aggregate costs or any other industry wide criteria, will suffice to assure a high cost producer of its costs to say nothing of a profit. We accept this as true.[24] The impact of an area rate in the natural-gas industry may have effects which cover the entire range from bonanza to bankruptcy. It is sufficient for us that these results were lucidly demonstrated in the dissenting opinion of Justice Clark in Second Phillips and did not deter the majority from allowing the Commission to proceed with its area rate program.

Some of the producers argue that if the Act is construed to permit area rate making, the Act is invalid under Art. I, § 1, of the United States Constitution because no legislative standards have been set for establishing groups or making group determinations. Reliance is had on Panama Refining Co. v. Ryan, 293 U.S. 388, which held that a delegation of legislative power to the President was unconstitutional because Congress, among other things, "has declared no policy, has established no standard, has laid down no rule."[25]

---

[24] An appendix to the Hunt brief presents an array of natural-gas costs of 44 Permian producers whose volumes total over 208 million Mcf. Of these, 16 producing over 170 million Mcf are shown to have costs of less than 14.5 cents. The remainder have costs running from 14.77 cents to 216.05 cents. We have been unable to check the accuracy of these figures and mention them only to show the claimed disparity of costs. Continental says that "approximately 67 percent of the companies and approximately 30 percent of the volumes had costs above the industry average cost level."

[25] 293 U.S. 388, 430.

Congress cannot delegate its power to enact laws but it can confer on an administrative agency the power to carry into effect laws which it has enacted.[26] In the New England Divisions Case, *supra,* the Court referred to the power given by Congress to the Interstate Commerce Commission to determine just and reasonable rates and said that Congress "intended that a method should be pursued by which the task * * * could be performed."[27] In Lichter v. United States, 334 U.S. 742, 785-786, the Court in discussing legislative standards said that the "standards prescribed by Congress are to be read in the light of the conditions to which they are applied" and for an example observed that "among those which have been held to state a sufficiently definite standard for administrative action [are] 'just and reasonable' rates for sales of natural gas."

In the regulation of the natural-gas industry "the actual necessities of procedure and administration"[28] have led to the adoption of the area rate method. We believe that neither constitutional nor statutory provisions prevent the use of that method and that the Commission did not abuse its discretion in adopting it. The more important and difficult question is that of the validity of the area rates which have been established. The controlling standard is the end result test of Hope. In our opinion, this test is accepted by, and reaffirmed in, the Second Phillips decision.

Some of the producers urge that the area rate method is not consistent with the characteristics of the industry and that contract prices satisfy statutory requirements because they have been reached through effective competition. The Commission considered and rejected the argument. It point-

[28] Id. at 198.

ed to the history of price negotiations in the Permian Basin, to the urgent requirements of the pipelines, to the heavy percentage of sales by a few producers, and to the control of undisclosed and uncommitted gas reserves by a few producers. It concluded that the record fails to establish that a just and reasonable rate can be established through competition and that "the primary competition revealed by the record was among the pipelines to secure new gas supplies at higher prices." Commissioner O'Connor disagreed saying that "the contract price at which most producers are able and willing to operate is just and reasonable." His conclusion was that "profit oriented costs and supply oriented contracts do not, in the aggregate, depart in any significant manner from each other." We accept the conclusion of the Commission that competition has not been effective to fix a just and reasonable rate. It is supported by reasonable inferences from the record and they are binding on us.

Continental and Superior say that they were improperly denied an opportunity to be heard on the geographical propriety of the Permian Basin as a rate area. In its order instituting the proceedings the Commission eliminated the issue of the appropriateness of the area for rate making purposes.[29] The Commission may draw on its expertise to determine the ground rules for an investigation but in so doing may not deny a specific right.[30] The producers fail to convince us that any such denial has occurred here. The Permian Basin is a well known area. Unless prices are to be determined on a national basis, areas must be selected and defined. The Commission had two choices. It could first determine the national revenue requirement and di-

---

[29] 24 FPC 1121, 1122.

[30] Amax Petroleum Corporation v. Federal Power Commission, 10 Cir., 350 F. 2d 92, 94.

vide that up among the areas or it could first determine the various rates so that in the aggregate they meet that requirement. We are unwilling to assume that when all the area proceedings are completed the total revenue will not equal the national requirement. If it does not, both the producers and the consumers will suffer. In our opinion the Commission acted reasonably in selecting the Permian Basin for an area rate proceeding.

6. **The Two-Price System.**

The Commission's two-price system is vigorously attacked on many fronts. It will be remembered that one price is fixed for new gas-well gas and another for flowing gas. All agree that gas is a commodity which is valuable as a source of energy. The householder does not care whether the gas which burns at the tip of his appliance comes from a gas well, an oil well, or as a residue product. To him gas is gas.

The justification for the two-price system is that the higher price for new gas-well gas provides an incentive to explore for and develop new supplies. The producers do not question the finding that "the industry is increasingly becoming able to direct its exploration efforts toward finding new gas-well gas as distinguished from finding gas as a by-product in the search for oil." This ability may be confined to the larger companies which maintain the technical staffs skilled in making the necessary predictions. The smaller producers are in a less advantageous position. They may be relegated to the farmouts which the majors pass down to them or to operations in accord with their less scientific but sometimes financially rewarding hunches.

New gas discoveries are well said to be the life blood of the industry. The consumers may reasonably be required to pay the price needed to bring forth such discoveries. If

an incentive price based on current costs is used for all gas, windfalls will be assured to many producers of old gas developed under lower historical costs and often found in association with oil.

The producers say that a single-price system based on current costs is required because revenues for current exploration and development must be internally generated from sales of gas from whatever source. The Commission rejected the argument. The question is not so much the source of the funds as it is the inducement to use available funds in the search for gas. The higher price for new gas is intended to supply that inducement. Although the adequacy of the inducement can only be tested by future developments, we are not convinced that the refusal of the Commission to include the same inducement in the price of old gas, with the resulting likelihood of wind-falls, was unreasonable.

Continental, Phillips, and others argue that the two-price system amounts to entrapment because of the possibility of reduction in price after financial commitments have been made. Although the Commission which announced the Permian Basin decision cannot bind a future Commission, we credit the Commission with good faith. The possibility of a change does not invalidate the rate method employed. When and if a reduction occurs, the argument of entrapment can be heard.

The division date of January 1, 1961, for the different prices of new gas-well gas and old gas-well gas is another subject of dispute. Here the Commission found as a fact that the appropriate date was the approximate time when directional drilling came to be used effectively. Under the evidence the selection of a division date was an administrative problem calling for the exercise of judgment. In making its choice the Commission acted within the evidence and

within its powers. On rehearing, the Commission left open for future consideration the problem arising when new gas-well gas is developed from committed acreage. We assume that this problem will be met fairly when it comes to a head.

The two-price system is an outgrowth of directional drilling for gas. Its purpose is to assure a continued gas supply. The Commission frankly says that the adoption of the system for the Permian Basin "should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies." We find no persuasive reason why the test should not be made.

7. The Cost Information.

In arriving at the Permian Basin rates the Commission used many sources of cost information. These included responses to questionnaires sent to producers, the Census of Mineral Industries for 1958, the Chase Manhattan Bank's 1961 Annual Analysis of the Petroleum Industry, the World Oil Magazine, the Oil and Gas Journal, the Joint Association Survey,[31] and others. The producers attack these sources on many and varied grounds. The range of objections runs from hearsay evidence through deprivation of right of cross-examination to denial of procedural due process. To take up each of these objections would increase the length of this opinion to encyclopedic dimensions.

From the information so obtained the parties, the staff, and the Commission make many computations and reach many results. The assumptions, allocations, formulae, equations, averages, means, and massive calculations may intrigue a mathematician or statistician but they have no

---

[31] This is a survey of a few producers conducted by the American Petroleum Institute, the IPAA, and the Mid-Continent Oil and Gas Association.

attraction for us. We respectfully decline to be drawn into such a turmoil of numbers. We cannot in a few months unravel the snarl of statistics developed in the years of hearings. In our opinion the judicial process, in cases such as this, should be confined to consideration of errors of law. We leave to the experts the selection of source material and the calculations to be made therefrom. Our concern is with the result.

8. The Commission's Price Determinations.

The Commission said that "costs must be a major factor in determining the area price." On the basis of current national statistics plus questionnaire data it determined the 1960 Mcf cost of new gas-well gas thus:

Exploration and Development Costs	
Dry Holes	1.42 cents
Other Exploratory Costs	1.59
Adjustments for Exploration in Excess of Production	1.11
Production Operating Expense	2.70
Net Liquid Credit	(3.10)
Regulatory Expense	.14
Depletion, Depreciation, and Amortization of Production Investment Costs	
Successful Well Costs	2.88
Lease Acquisition Costs	.76
Cost of Other Production Facilities	.31
Return of Production Investment (at 12%)	5.21[32]
Return on Working Capital	.35
Subtotal	13.37
Royalty at 12½ percent	2.05
Production Taxes	1.01
Total	16.43

[32] This is computed as follows: The production investment is the sum of successful well costs, lease acquisition costs, and cost of

The Commission rounded this figure off at 16.5 cents for the Texas production. Because the New Mexico figure is exclusive of taxes a reduction of one cent was made in the New Mexico price.

For the costing of flowing gas the Commission used historical data developed by the industry questionnaires. The results may be summarized thus:

Production operating expenses	1.75 cents
Depreciation, depletion and amortization	2.42
Return at 12%	4.99
Exploration and development	4.08
Regulatory expense	.14
	13.38
State Production tax at 7%	1.01
	14.39[33]

This figure was rounded off at 14.5 cents for Texas and 13.5 cents for New Mexico. As a check on the method used the Commission backtrended the new gas-well gas figures and arrived at a 14.64-cent price.

The rates so established are subject to downward adjustment because of quality deficiencies and to both downward and upward adjustments on the basis of Btu content. The Commission disclaims any intent that the rate figures show producer costs. It says that the price of new gas-well gas is "geared" to costs derived from national statistics and the questionnaire data and that for flowing gas

---

other production facilities or a total of 3.95 cents. It is to be recouped over an average period of 10 years beginning an average of one year after investment. Accordingly, the return is allowed on an investment base 11 times the production investment of 3.95 cents per Mcf or 43.45 cents. 12% of this figure is 5.21 cents per Mcf.

[33] No separate item was included for royalty payments because costs were computed on 7/8 of actual volumes.

the "touchstone" is the historical price of Permian gas.[34] Other undefined and unidentified "factors" were taken into consideration.

9. **The Moratorium.**

The Commission implemented the price provisions of the decision in various ways. It imposed a moratorium on rate increases until January 1, 1968, "except in compliance with a specific order of the Commission for a rate as determined pursuant to said proceeding [AR61-1] or pursuant to later order of the Commission." The producers say this violates the Act because § 4 permits filings for rate increases. Section 4 must be read with other sections of the Act. Section 5 authorizes the Commission to determine the just and reasonable rate "to be thereafter observed and in force." Section 16 gives the Commission power to make such orders "as it may find necessary or appropriate to carry out the provisions of this act." In Callery the Court held that there was ample power under § 7(e) to impose a moratorium.[35] We believe that there is also ample power under §§ 5(a) and 16. The reasonableness of the exercise of the power is established by the need for price stability, the Commission's expressed willingness to reopen the proceedings to consider the propriety of changes, and the expiration date which is only about a year off.

10. **The Escalation Clauses.**

The Commission's order forbids the filing of rate changes in excess of applicable area rates when the contractual

---

[34] In Opinion No. 468 the Commission said: "Nevertheless, we make clear that we do not confine ourselves to a cost calculation in determining just and reasonable rates."

[35] 382 U.S. 223, 228.

right thereto is based on indefinite escalation clauses not permitted by § 154.93(a), (b), and (c) of the Regulations under the Natural Gas Act. The producers say that this provision destroys existing contract rights. The Commission replies that it has not proscribed the clauses but merely the right to file under them. This is a thin distinction. In Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F. 2d 241, 245, we upheld § 154.93 and pointed out that if a producer felt aggrieved thereby it could apply for a rule waiver under § 1.7(b) of the Commission's Rules of Practice and Procedure. We assume that a similar request could be made under the Permian order. When the request is made and rejected, the time will arrive for the consideration of the constitutional questions which the producers raise.

11. **The Commission's Fair Relationship Standard.**

In fixing the amounts of the area rates the Commission rejected the end result test and adopted a fair relationship standard. This appears clearly from Opinion No. 468-A. After disclaiming that it had made any finding that "jurisdictional revenues will equate to jurisdictional costs," the Commission said:

> "* * * we are convinced that the record fully justifies the Commission's judgment that the ceiling prices we have fixed 'provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur' in the Permian Basin."

Hope says that in the fixing of just and reasonable rates there must be a "balancing of the investor and the consumer interests."[36] It goes on to say that from the company point of view the revenue must not only provide operation expense but also capital costs including "service on the debt and

[36] 320 U.S. 591, 603.

dividends on the stock"; and that the return to the equity owner must be commensurate "with returns on investments in other enterprises having corresponding risks" and "sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital."[37] The Court concluded the discussion of this problem with the observation that in Hope the "end result" could not be condemned as unjust and unreasonable.

In Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 605, the Court, after referring to the Natural and Hope decisions said:

> "In those cases we held that the question for the courts when a rate order is challenged is whether the order viewed in its entirety and measured by its end results meets the requirements of the Act."

Also pertinent is the statement of the Court in Second Phillips that:[38]

> "To whatever extent the matter of costs may be a requisite element in rate regulation, we have no indication that the area method will fall short of statutory or constitutional standards. The Commission has stated in its opinion in this proceeding that the goal is to have rates based on the 'reasonable financial requirements of the industry' in each production area, * * * and we were advised at oral argument that composite cost-of-service data will be considered in the area rate proceedings."

Nothing in Second Phillips rejects the end result test of Hope. We believe that it applies here and that it is not satisfied by a finding of fair relationship. Something more than mere semantics is involved. The determination of a

---

[37] Ibid.

[38] 373 U.S. 294, 309-310.

fair rate from the standpoint of the consumers must depend to large extent on the informed judgment of the regulatory agency. In these proceedings no distributor, consumer interest, or consumer representative objects to the rates. They are accepted as just and reasonable.

From the standpoint of the producer the situation is different. It is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. These requirements must be tested against the record. They may not be brushed aside with a general finding of fair relationship. The Commission concedes that it did not equate jurisdictional costs to jurisdictional revenues. This is obvious because no determination was made of the jurisdictional revenues which the rates will produce.

12. **The High Cost Operator and the Small Producer.**

The Commission broke down the rates into components which it justified on averages based on national statistics and questionnaire data. We recognize that weighted averages and sifted averages are suspect.[39] We accept the principle that both the basic figures and the averages obtained therefrom must be typical and representative but we are not convinced that the Commission has misused its expertise in this technical field. It is self-evident that when average costs are used to compute ceiling prices, the high cost operator will be hurt and some low cost operators may receive windfalls. Probably to a greater extent than in any other comparable segment of the national economy the element of chance can affect the success or failure of even the most prudent entrepreneur who engages in the natural-gas business.

---

[39] See United States v. Abilene & Southern Railway Company, 265 U.S. 274, 291, and Interstate Commerce Commission v. Mechling, 330 U.S. 567, 583.

The problem of the high cost operator is characteristic of group or area rate making. The Supreme Court upheld group rates in Acker v. United States, 298 U.S. 426, 431, and commented that "regulation cannot be frustrated by a requirement that the rate be made to compensate extravagant or unnecessary costs." In Tagg Brothers v. United States, D.C. Neb. 29 F. 2d 750, 755, affirmed 280 U.S. 420, the court said that it was not necessary "to fix the rates so high that all agencies in the business would make money." Covington & Lexington Turnpike Road Company v. Sanford, 164 U.S. 578, 596, says that "the public cannot properly be subjected to unreasonable rates in order simply that stockholders may earn dividends."

The small producers, represented here by Big Chief Drilling Company, IPAA, Texas Independent Producers & Royalty Owners Association (TIPRO), J. C. Barnes, and others, join in the prediction that the Permian decision sounds the death knell of the small producers. Perhaps the flamboyant wildcatter must be replaced by the scientists of the industrial giants but the efforts of the boom-or-bust adventurers have contributed greatly to natural-gas discoveries. In its decision the Commission referred to the "smaller independent who traditionally drills much of the Permian exploratory acreage" and said that: "Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators who contribute a large share of the discoveries of new sources of gas."[40]

---

[40] Big Chief asserts that the small producers, although credited with only 20% of current production volumes, actually drill almost 40% of all successful gas wells and 50% of all successful exploratory gas wells.

The Commission took note of the suggestions that small producers should be exempt from regulation.[41] It found that outright exemption was neither necessary nor desirable but said that the small producers needed "special treatment." To this end it defined a small producer as "a natural gas company selling jurisdictionaly less than 10,000,000 Mcf annually on a nation-wide basis." They were granted relief from various requirements of §§ 7 and 4 and were freed from rate adjustments because of quality differentials. In our opinion the classification is reasonable and within the Act.

The small producers do not seek complete exemption. Their attitude is that such relief would be illusory rather than real because the pipelines would not pay more for gas supplied by them than the price paid to the major companies. Their complaint is that the Commission did not give adequate consideration to small producers' costs.

Data covering the costs of Permian producers came from questionnaires which are classified as Appendix B and Appendix C. The Appendix B group was mandatory for producers with company-wide jurisdictional sales of over 10 million Mcf and optional for others.[42] The Appendix C questionnaires went to the small producers. Forty-two of the majors and 25 of the small producers answered Appendix B. The response to the Appendix C questionnaires was sporadic. The Commission used only the material supplied by the majors saying that the inclusion of the data supplied by the small producers "does not affect the results."

---

[41] See statements of Justice Clark dissenting in Second Phillips, 373 U.S. 294, 329-330, and speaking for the Court in Federal Power Commission v. Hunt, 376 U.S. 515, 527.

[42] Appendix A pertained to well and drilling statistics. It is not pertinent here.

TIPRO and Big Chief both emphasize the testimony of a staff witness that the small producer questionnaire showed average unit costs 2 cents per Mcf higher than those of the majors. They argue that the end result standards must be applied not only to the entire group but to them as a group. The weakness of the argument is that once the whole group is split the process can be carried on until the regulation is back on an individual company basis.

We do not know the answer to the small producer problem. Superficially it seems unfair to fix ceiling prices for all producers, both large and small, on the basis of the costs of large producers only. The Commission rejected the small producer data because in its opinion the impact on the rate structure was de minimis. On the record presented, we are unwilling to say that this conclusion was erroneous as a matter of law.

In any regulation of the natural-gas industry on an area basis the high cost producers, be they majors or little fellows, are certain to be placed in a position less advantageous than that occupied by those whose good fortune and able management have supplied a lower cost base. We agree with the Commission that the expense items included in an individual cost-of-service are not the measure of a confiscatory rate. A producer has no constitutional right to be reimbursed for dry-hole expenses.[43] Also it has no obligation to remain in business by replenishing the supplies of gas which form the basis of present obligations. Inability to continue exploration and development is not confiscation. We conclude that the impact of the Permian rates on the high cost producers does not destroy the area rate method.

---

[43] Cf. Columbus Gas & Fuel Co. v. Public Utilities Commission of Ohio, 292 U.S. 398, 407.

13. **Gathering and Processing Costs.**

One subject of much discussion in the briefs is the allowance of the same rate for gas delivered at the tailgate of a processing plant and for gas delivered at the wellhead. Gathering lines cost money and have to be built and operated by someone. The Commission's position is that the revenues received for oil and oil products derived from condensation and processing return a profit which induces the building of the needed gathering lines and plants. Here again we reach the troublesome field of cost allocations between a regulated commodity, gas, and unregulated commodities, oil and liquified petroleum products.

Bass places particular emphasis on this phase of the case. It points to its extensive investments in gathering lines and plants and to its permanently certificated rate of 18 cents which, it says, the Commission has never specifically found unreasonable or discriminatory. The answer as we see it is that if area rates are proper no greater need exists for the consideration of the individual cost and revenue requirements in the case of Bass than in the case of the other producers. Perhaps in the future courts will have to explore the mysteries of allocations but we are not so inclined in this case. If in fact Bass and others similarly situated are confronted with confiscation, a way must be open for them to be heard.

14. **Special Exemptions.**

The Commission recognized that some provision must be made for special exemption from area rates. It said that when a producer's "out-of-pocket expenses in connection with the operation of a particular well are greater than the revenues under the applicable area price, he should be entitled to appropriate relief." It declined to "specify

all of the special circumstances which may serve as a basis for exceptions to the area rate" and observed that failure to earn exploration and development expenses plus the allowed return does not amount to confiscation. In regard to the form of relief it held that "it may be sufficient to permit them to abandon their unprofitable sales."

We agree with the Commission that an escape clause cannot be used to convert an area rate into an individual company cost-of-service rate but an escape clause which does no more than prevent an unconstitutional confiscation amounts to nothing. None is needed for that purpose. The producers are right in saying that the Commission's exemption provisions are so vague and nebulous that neither they nor a court can determine what relief is being granted. Out-of-pocket expenses are not defined and we do not know what they include. If a producer's accounting is on a lease rather than well basis, the facts relating to a particular well might not be determinable. It may be going too far to say categorically that individual producers should be permitted to show that the group costs are not typical or representative of their costs but in some instances that should be permitted. Conservation of gas is promoted if marginal wells are allowed to continue to produce but is discouraged if the same wells are shut down by a low price. Some producers furnish gathering facilities. Others sell at the wellhead and the pipelines pay for the gathering. Gathering costs are allowed pipelines. Perhaps in some instances they should be allowed to producers. An adequate savings clause should contain guidelines which if followed by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided. It is not enough to say in effect that confiscation will be prevented. Confiscation is an individual proposition and the individual is entitled

to be heard. We are convinced that the Commission's special exemption provisions are inadequate.

15. **Quality Standards.**

The Commission provided for adjustments in the area rates to reflect quality differentials. It said that "the price of gas cannot be related to volume alone but must be related to units of energy free of impurities and sufficiently compressed to enter the pipeline." Standards were fixed for content of carbon dioxide, hydrogen sulphide, total sulphur, water, and other impurities; and the amount of delivery pressure was established. The applicable base area rate is adjusted downward by the net cost of processing the gas to bring it up to standard. Provision is made for both an upward and a downward adjustment of rate depending on the Btu content. Quality statements are required to be filed together with an agreement by the seller and the buyer covering the cost of bringing the gas up to standard. If an agreement cannot be reached, each shall file a statement of its views on the processing costs.

About 90% of the flowing gas is substandard. We are cited to no figures on the similar percentage of new gas-well gas. The amount of the rate adjustments does not appear in the record because there was no evidence of the extent of quality differentials or of the processing costs of bringing the gas up to standard.[44] At oral argument various estimates were given as to the amount of rate reduction which would result from substandard quality. These were based on statements filed pursuant to the decision but after the record was closed. They ranged from .7 cents to 2.0 cents per Mcf. A spokesman for the Continental

[44] The Commission says in its brief that "appropriate price differentials or adjustments could not be made on the basis of the record."

Group said that on 1960 volumes a revenue deficiency of some $12 million a year would result. The Commission response in this court to the Skelly motion for stay of the Commission's orders herein said that the reductions in applicable rates because of adjustments for quality standards are expected to result in a revenue reduction of about $10 million annually.[45]

The producers' argument that the imposition of quality standards violates procedural due process because of lack of notice need not be resolved at this time. We are remanding the case and now everyone has notice. The matter of the Btu adjustments presents a particular problem which was emphasized by Commissioner O'Connor in his dissent. The price goes down if the Btu content is below 1,000 and goes up if it is above 1,050. The producers say the adjustment upward should begin at 1,000. We do not understand the Commission's reasons for the gap. On remand this can be clarified.

16. **The Rate of Return.**

The Commission says that the impact of the quality adjustments is taken care of in the rate of return which is made generous on this account. It fixed a rate of return of 12% on production activities and held that such rate "protects gas consumers against excessive prices but it is not so low that it fails to respond to the needs of the industry." The principles applicable to the determination of an appropriate return are set forth in Bluefield Water Works & Improvement Co. v. Public Service Commission, 262

[45] The statement was this: "It has been estimated that the reductions to the base rates alone will reduce the revenues from jurisdictional Permian sales by about $10 million annually. The adjustments for quality standards, which were substantially altered by Opinion 468-A * * * are expected to result in a further reduction of the same magnitude."

U.S. 679, 692-693. It "must be determined by the exercise of a fair and enlightened judgment, having regard to all relevant facts." The rates of a public utility should "permit it to earn a return on the value of the property * * * equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties" but the utility has no constitutional right to profits realized by "highly profitable enterprises or speculative ventures." The return should assure "confidence in the financial soundness of the utility" and be adequate under prudent management "to maintain and support its credit ad enable it to raise the money necessary for the proper discharge of its public duties." The Hope decision[46] states the same basic principles.

The Commission recognized these controlling principles. The objections of the producers are to the point that the allowed rate of return is inadequate to enable the industry to attain the goals which the principles contemplate. At this time there is no need for us to go into the comparisons of the returns appropriate for producers as opposed to pipelines or to the financing methods employed by either. The fact is that by treating quality deductions as a risk rather than a cost the Commission has made it impossible to determine the amount of return with any degree of certainty. The difficulty is that the record does not disclose the amount of deductions.

A fair rate of return cannot be ascertained with mathematical certainty.[47] Pragmatic adjustments may be made by an agency within the ambit of its statutory authority.[48]

---

[46] 320 U.S. 591, 603.

[47] Colorado Interstate Gas Co. v. Federal Power Commission, 10 Cir., 142 F. 2d 943, 961-962, affirmed 324 U.S. 581.

[48] Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 586.

A court must put great reliance on agency expertise in evaluating a rate of return but this does not mean that a court must accept the agency determination in blind faith. A producer is entitled to a higher rate of return than a pipeline because of the greater risk of the business. The Commission has here compounded the risk of discovery with the risk of substandard quality.

We believe that the price reductions to reflect quality deviations are an item of cost rather than an item of risk and should be directly reflected in the applicable base rates instead of hidden in a rate of return allowance. The amount of cost is the expense of bringing the quality up to standard. In the Permian Basin sound reason exists for this conclusion because of the known and substantial quality deficiencies particularly in flowing gas production. We find it hard to understand why a revenue deficiency in the estimated amount of $10 million annually should be classified as a risk and not a cost. A risk occurs as the result of unknown or unconsidered contingencies. In the Permian Basin it is known and considered that flowing gas falls short of pipeline standards. In any event, the lack of evidence as to quality deductions makes it impossible to determine whether the rate of return satisfies the Bluefield and Hope principles and we have no basis on which to appraise the allowance made by the Commission. We respect the expertise of the Commission but the conclusions reached by the use of expertise must accord with legal standards.

17. Contract Limitations.

The producers say that recovery of industry costs under the area rates is impossible because many of the existing contracts do not permit a producer to file for the flowing gas ceiling price of 14.5 cents. The Commission recognized that "there undoubtedly will be some contract prices

lower than the area rate ceiling, as adjusted for quality." Some of the producers estimate the deficiency because of contract limitations to be $14.4 million in the test year of 1960. The Commission has estimated that a reduction of base rates alone will result in a revenue reduction of about $10 million annually.[49]

It is elementary that gas prices are originally set by contract between the producer and the pipeline, that the producer may not raise the price unilaterally, and that any increase in price must be within contract terms unless the price is set so low as to affect the public interest. The Commission says that the producers are not entitled as a matter of right to collect contract rates that are higher than otherwise reasonable in order to offset other rates limited by contract to below maximum reasonable levels. Regulation does not guarantee an over-all profit;[50] relief from an unduly low rate may be given only if the rate is "so low as to adversely affect the public interest — as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory";[51] and a company's losses in one instance do not justify an illegal gain in another instance.[52] At the same time in such group procedures as the division of railroad rates the Interstate Commerce Commission, with court approval, has recognized that revenue from one source may balance that from another.[53]

---

[49] See supra, note 45.

[50] Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 590.

[51] Federal Power Commission v. Sierra Pacific Power Co., 350 U.S. 348, 355.

[52] Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, 153.

[53] See New England Divisions Case, 261 U.S. 184.

Contract limitations are one of the facts of life for the natural-gas industry. They are the outgrowth of the days when gas, which had previously been vented, flared, or capped, became salable to the newly constructed interstate pipelines. The pipelines wanted long-term contracts and the producers wanted to sell their gas. Prices were low. With the phenomenal increase in the use of gas as an energy source the prices rose. The producers whose contracts either contained no escalation clauses or clauses of the type proscribed by the Commission were in a disadvantageous position. Even permissible escalations do not, in many instances, bring the 1960 price up to the area ceiling. In Second Phillips the Court upheld the termination of certain § 4(e) dockets on the Commission's finding that "the annual increase in revenue produced by these increased rates was substantially less than the deficit for the test year 1954."[54] The same situation exists here for many companies. We do not know whether it exists for the area producers as a group because no finding was made of revenue and requirements. The Supreme Court has said that losses in one instance do not justify illegal gains in another. To us this means that the contract limitations do not preclude the establishment of a just and reasonable area rate. The answer is provision for a minimum rate.

The Commission held that "the establishment of minimum rates in this case is in the public interest and that the price impact on the consumer will be de minimis." It established a minimum rate of 9 cents per Mcf for gas of standard pipeline quality. We believe that the controlling question is whether the proper revenue requirements of the area producers as a group can be satisfied with rates having the ceiling and the floor which the Commission has fixed.

---

[54] 373 U.S. 294, 305.

This cannot be answered because the financial impact of the quality deductions is not ascertainable from the record.

18. **Refunds.**

The revenue deficiency argument of the producers leads directly to the refund issue. The Commission required "appropriate refunds in the case of rates which are the subject of proceedings under Section 4(e) of the Act, and have thus been collected subject to an obligation to refund amounts collected in excess of the just and reasonable rates as here determined." Procedures to accomplish this result were set up in detail.

The producers say that these individual company refunds are not proper because of the revenue deficiency of the industry. They say that in the test year of 1960 the producers in the area failed to meet their revenue requirements by $14.4 million and they estimate the refunds for that year under the Commission decision to approximate $6 million.

The Examiner held that refunds should be ordered only to the extent that over-all industry revenues exceed over-all industry expenditures in a given year. The Commission said that this theory was unworkable because it would result in inequities among both the buyers and the producers and because of "insurmountable" administrative difficulties. We are at a loss to understand how refund obligations, which might come into existence under the Examiner's approach, would be divided among the producers.

We see no escape from the requirement that refunds be on an individual company basis and on a schedule by schedule basis. As we understand Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, 153, refunds are appropriate for each excessive rate re-

gardless of over-all revenues. The Commission has required refunds only on § 4(e) rate increases above the applicable area ceiling. If a producer claims that the refunds required of it are confiscatory or harmful to the public interest, it must have an opportunity to petition for special relief. A similar opportunity must be afforded if a producer can show that a refund is required for collections at or below the "last clean rate."[55] An adequate special exemption clause can take care of such situations.

19. **The End Result Test.**

This brings us back to the end result test. The Continental Group, which includes many large producers and major integrated oil companies and which is supported by Phillips, presents alternative arguments. The first is economic. It is said that regulation under the Act must be consistent with the economic characteristics of the industry; that this requires the establishment of market prices based on contracts; that a cost-based system of regulatory rates does not recognize the responsiveness of the gas supply to gas prices; and that a producer does not explore on the expectation of a return of its cost plus a return on its investment but on the hope of getting back many times what it expends as a reward for its gambler's risk. No doubt these are the economic facts of the industry.

The divorce of commodity value from costs was suggested by Justice Jackson in his dissent in Hope. He commented that a producer would have difficulty showing the invalidity of a fixed commodity value so long as it voluntarily continued to sell its product in interstate commerce.[56] One difficulty with this suggestion is that once the gas is

[55] By "last clean rate" is meant the last rate in effect pursuant to a permanent certificate not subject to any refund obligation.

[56] 320 U.S. 591, 652.

committed no withdrawal from interstate movement is possible without Commission approval.[57] A producer can stop exploration and development if it is dissatisfied with price but the interstate sales go on with a continuing impact of cost on price and of price on exploration and development. In any event the majority rejected the proposal and held that under the just and reasonable standard of the Act a regulated company is entitled to revenue for operating expenses and capital costs and to a return "commensurate with returns on investments in other enterprises having corresponding risks."[58] These standards cannot be met without consideration of costs and revenues. In our opinion the Hope construction of the statutory standard casts serious doubts on the validity of the adoption of a contract-based commodity value.

The alternate argument of the Continental Group is that if the rates are to be determined on a composite cost-of-service basis, the revenue requirements of the industry must be found and rates fixed to meet those requirements. In Second Phillips the Court particularly noted the assurance of the Commission that "composite cost-of-service data will be considered in the area rate proceedings."[59] Consideration of such data does not eliminate consideration of other factors. At the same time Second Phillips did not reject the end result test of Hope. Instead it quoted a portion of that opinion which said among other things that "it is the result reached not the method employed which is controlling."[60]

---

[57] Section 7(b) of the Act. See also Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 156.

[58] 320 U.S. 591, 603.

[59] 373 U.S. 294, 310.

[60] Id. at 309.

The Commission rejected both alternatives of the Continental Group. It said that commodity value established by contracts may not be used because of the absence of effective competition; and it emphasized that it took into consideration factors other than costs. The record does not disclose what these other factors were but they must have had some economic basis. The Commission held that its ceiling prices provided a "fair relationship" between consumer prices and producer costs. Fair relationship is pertinent but it is only part of the end result test. We do not know the producers' costs or revenue requirements. We do not know the economic factors which either require or permit departure from costs and revenues. The end result test is not satisfied by a reliance on unknowns.

We have accepted the Commission's conclusion that contract rates should not be used. The trouble is that the Commission decision rides two horses and we have no way of knowing the outcome of the race. It uses composite cost-of-service evidence, engrafts economic factors on top, and comes out with a rate which it justifies on a fair relationship basis. We have the problem of how in such circumstances a court can determine whether the just and reasonable standard of §§ 4 and 5 has been met. The answer is not found in the record before us.

The facts sustaining the conclusion of fair relationship must be found. The Commission did not make those findings and indeed it could not have done so because of the failure of the record to disclose the revenue impact of the adjustments in area rates to reflect quality differentials. Whether rate reductions because of quality deficiencies are a risk or a cost, the answer comes out the same. If they are a risk, we do not know the rate of return. If they are a cost, we do not know whether revenue received will equal the reasonable revenue requirements. We believe

that under Hope, and under Second Phillips, the area producers, as a group, are entitled to recover their prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. Satisfaction of this requirement must appear through appropriate findings based on substantial evidence. These cannot be made on the record presented. The decision of the Commission is not saved by the special exemption provisions which we find to be insufficient and unsatisfactory.

Rate making under the Act has produced a superabundance of delay and litigation. Much gas has moved through the pipelines since the First Phillips decision. We wonder if the time has not come for the establishmnt of a better rapport among the Commission, the consumers, the distributors, the pipelines, and the producers. Some practical means of resolving the economic and legal issues is highly desirable. The Commission has approved many settlements. The use of this procedure may well be explored further in an effort to obtain a true "balancing of the investor and the consumer interests."[61]

One point remains to be mentioned. Eleven motions for leave to adduce additional evidence were filed with us by various producers. We deferred all to the hearing on the merits. In view of the disposition which we make of the cases we see no reasons to explore evidentiary problems which may arise on remand. The Commission will hold such additional hearings as are needed to determine the effect of the quality adjustments, and to determine the group revenues and the group revenue requirements. It will make appropriate findings on these matters. The order based thereon shall contain an adequate provision for special ex-

---

[61] 320 U.S. 591, 603.

emptions. We decline to make advance rulings on the procedures to be followed or on the evidence to be received.

The motions to adduce additional evidence are severally denied. The petitions to review are severally granted and the cases are all remanded to the Commission for further proceedings consistent with this opinion.

Judgment

THIRTEENTH DAY, JANUARY TERM,
FRIDAY, JANUARY 20TH, 1967.

Before Honorable David T. Lewis, Honorable Jean S. Breitenstein and Honorable Delmas C. Hill, Circuit Judges.

No. 8510

THE SUPERIOR OIL COMPANY,
Petitioner,

v.

FEDERAL POWER COMMISSION,
Respondent.

On Petition to Review an Order of the Federal Power Commission.

This cause came on to be heard on petition to review an order of the Federal Power Commission and motion to adduce additional evidence and was argued by counsel.

On consideration whereof, it is ordered by this court that the motion to adduce additional evidence is hereby denied. The petition to review is granted and the case is remanded to the Commission for further proceedings consistent with the opinion of the court.

v.

FEDERAL POWER COMMISSION,
Respondent

PETITION FOR A WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

The States of New Mexico and Texas, Petitioners in the above styled case, respectfully pray that a writ of certiorari issue to review the judgment and opinion of the United States Court of Appeals for the Tenth Circuit entered on January 20, 1967.

OPINIONS BELOW

The opinion of the Court of Appeals for the Tenth Circuit is styled *Skelly Oil Company, et al., Petitioners, v. Federal Power Commission, Respondent,* Nos. 8385, *et al.* A copy of the Court decision is printed as Appendix A to the brief of Petitioner, Continental Oil Company. The opinion and orders of the Federal Power Commission (R. 516d-826d, 1105d-1132d, 1154d-1157d) are reported at 34 FPC ————, ———— ————, ————.

JURISDICTION

The jurisdiction of this Court is invoked under 28 USC § 2101 and Rule 19 of the Rules of this Court. The judgment of the Court of Appeals was entered on January 20, 1967.

QUESTIONS PRESENTED

1. Whether the Federal Power Commission, in fixing producer rates under the Natural Gas Act, is required to protect the public interest of producer states as well as consumer states?

2. Whether the Federal Power Commission, in fixing producer rates under the Natural Gas Act, is required to consider the economic import of its orders on the producing states involved?

3. Whether the Federal Power Commission, in fixing producer rates under the Natural Gas Act, is required to consider the impact of its orders on the conservation efforts of the producing states, ie. whether its orders will result in waste of recoverable natural gas reserves.

4. Whether the Federal Power Commission, in fixing producer rates under the Natural Gas Act, is required to make an express finding that the rates established by its orders will elicit a level of exploration and development high enough to assure an adequate supply of natural gas for the future.

STATUTES INVOLVED

The Natural Gas Act, 52 Stat. 821 *ff.*, 15 USC § 717-717w.

PRELIMINARY STATEMENT OF POSITION

These Petitioners support the arguments and points presented and set out in the Continental Oil Company's Petitioner for a Writ of Certiorari heretofore filed with this Court. In addition thereto, it is the position of these Petitioners that they are affected in their governmental capacity by the subject orders of the Federal Power Commission and that the questions presented above must all be answered in the affirmative.

INTRODUCTION

These Petitioners, recognizing that an area rate hearing establishing prices for natural gas in the Permian Basin would have a far reaching effect, not only on the Permian Basin area itself but on the economy of the entire states, intervened in the Permian Basin Hearing, and actively participated in the hearings before the Federal Power Commission, the Denver Court and have now appealed to this Court as sovereign states, on behalf of their citizens and in order to protect the public interest.

While these Petitioners do not drill or operate any gas wells in the Permian Basin or elsewhere it is contended that they nevertheless have standing to challenge the rates established by the Commission because of the adverse effect of the same upon the States of New Mexico and Texas. In fact, these states are in all probability damaged by these orders in a greater dollar amount than any other party to these proceedings.

These Petitioners would show that the State of Texas has over 4.7 million acres of minerals located in the Permian Basin area and that the income royalties and

bonus money from these minerals go into the Permanent School Fund for educational purposes. Likewise, Petitioner State of New Mexico owns more than 3 million acres of mineral lands located within the Permian Basin and the royalties and bonus money derived from these minerals go into its school fund.

These Petitioners have imposed certain taxes upon the production of natural gas within their boundaries. This is done in recognition of the fact that natural gas like other natural resources is a wasting asset, and once produced and transported to other states for consumption, its value is forever lost. This tax is calculated upon the value of the gas at the well, and it is axiomatic that any reduction in its value will necessarily result in a reduction of the taxes received by these Petitioners.

There are many communities in the State of New Mexico which depend almost entirely on the oil and gas industry for their existence, and accordingly the State has an abiding interest in maintaining the future existence of this industry.

Without the oil and gas industry, a quarter of New Mexico's population could vanish and be forever lost. Such a calamity would cost the State untold millions of dollars.

More than one million Texans live in the Permian Basin area today, and, without a healthy petroleum industry, this population cannot be supported.

Testimony of witnesses for the State of Texas reflects that the Permian Basin area does not readily lend itself to manufacturing, and the majority of manufacturing in the area is tied to the petroleum industry.

Agriculture in the area is mostly confined to ranching, and even if the climate were more favorable, agriculture could not provide the jobs afforded by the petroleum industry.

The rates set by the Commission in the instant case have an adverse impact on the conservation efforts of the States of New Mexico and Texas. This comes about by virtue of the fact that the Commission established rates are considerably lower than existing contract rates in the area. This reduction makes it uneconomical to continue production in many "stripper fields" in the area.

Although daily per well production from these fields is relatively low, their combined remaining recoverable reserves nevertheless constitute a considerable percentage of the total reserves for the area which will be forever lost if it becomes necessary to plug and abandon these fields for economic reasons.

Another adverse result of the rate reduction ordered by the Commission is the corresponding reduction in exploration and development that will inevitably result. Even under the higher existing contract rates, the historical level of exploration and development has been insufficient to keep pace with the ever increasing consumer demand for natural gas. A shortage of gas will inevitably result, and, because of the considerable time lag between initial exploratory efforts and ultimate discovery and production of substantial new gas supplies, such a shortage cannot readily be corrected. Such a situation is undesirable from a conservation standpoint since the pressures of crash efforts to meet excessive demands inevitably result in both physical and economic waste.

ARGUMENT

The Commission failed to meet its statutory responsibilities to assure adequate supplies of natural gas for the nation and to protect the interest of the public (which includes the producing states as well as the consumer states). As clearly stated in 15 U.S.C.A. Section 717 (a):

> ". . . it is declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest."

These Petitioners reiterate that the "public interest" requires the Commission to consider the effect of its order and opinions upon producing states as well as upon consumer states. Certainly, the interest of producing states is a part of the "public interest" and should not be ignored. A decrease in the price of gas of several pennies per Mcf, as ordered by the Commission, would hardly be noticeable to the average consumer in California and in other areas outside of Texas and New Mexico. At most, such a decrease would effect a savings to the average California home owner of only a few dollars a year. However, such a decrease in gas prices as required by the subject opinions and orders could not only place a large number of both large and small independent producers in New Mexico and Texas out of business because of their inability to meet expenses with the resulting lowering of income, but it could also have a serious impact upon every citizen of Texas and New Mexico. In short, an insignificant savings of a few dollars a year for the average

gas consuming family in California and in other areas outside of these producing states is in issue while for the many large and small independent producers throughout the Permian Basin area industrial survival is at stake. When the natural gas industry loses its independent producers through governmental interference with contract prices, the industry also loses their exploratory efforts; and, in the long run, the consumers throughout the nation will suffer for lack of supply, and, in addition the producing states will lose an indispensable source of tax revenue. Through loss of revenue to these States in the form of royalty payments and production taxes, the state school funds, and indeed many other portions of the States income, will be substantially lowered, which in turn could well result in these States' citizens bearing the burden of additional taxes in order to offset such revenues losses. Thereby, in effect, the citizens of Texas and New Mexico would be subsidizing the users of Permian Basin produced gas in other States. Such is the overriding, all important concern of these States.

The Legislatures of both the States of New Mexico and Texas long ago enacted comprehensive oil and gas Conservation Codes. These codes strenuously enforced by the Conservation Commission of New Mexico and the Texas Railroad Commission, both highly respected administrative agencies which have under their combined charge and supervision the greater part of the known natural gas reserves in the United States of America. The successes that they achieve in preventing waste are enjoyed not only by their respective States but by the entire nation. The efforts of these agencies are truly in the public interest—the interest of all the public, not just one faction.

CARD 6

The reduced rates established by the Commission will result in the premature abandonment of many "stripper fields" in New Mexico and Texas. The remaining reserves in these fields will be wasted and forever lost to both producers and consumers.

Thus a conflict has arisen between the efforts of the Federal Power Commission and the Conservation Agencies of the States of New Mexico and Texas. This is true despite the fact that the agencies on both sides of this conflict have as their stated purpose the protection of the "public interest."

It is submitted that the public has a greater interest in the conservation of the nation's natural gas reserves than it does in prepetrating the lowest possible gas rates to the consumer and that if and when these two public policies should come into conflict, the latter must give way to the former.

The Tenth Circuit Court of Appeals in this case rejected these arguments when it stated:

> "The states of Texas and New Mexico, besides adopting the briefs and arguments of the Continental Group, assail the Commission decision on grounds peculiar to them in their governmental capacity. They say that the public interest, which the commission is required to protect, includes the producing states as well as the consuming states; that the prices which the Commission has set will cause a cessation or curtailment of exploration and development activities to the serious injury of the economy of the Permian Basin; that waste rather than conservation of a natural resource will result; and that the states and their public entities will suffer severe losses in taxes and royalty payments. Similar arguments were made by West Vir-

ginia in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 607-614, and were rejected by the Supreme Court which said that when Congress passed the Natural Gas Act it 'was quite aware of the interests of the producing states in their natural gas supplies' and that nothing in the Act intimates that high prices should be maintained so that 'the producing states obtain indirect benefits.' The rejection of the states contentions in Hope requires the rejection of the same contentions here."

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, has been cited as authority that the Commission in setting the price of gas at the wellhead cannot consider the economic impact its order will have upon the producing states.

Granted that West Virginia's argument in the *Hope* case is in some respects similar to the position taken by the States of Texas and New Mexico in the Permian case now before the Court, the *Hope* case is nevertheless distinguishable on its facts and cannot serve as a precedent in this case.

The *Hope* case arose from an original complaint filed in 1938 by two consumer cities alleging that Hope's charges were excessive and "unjust and unreasonable." Hope was primarily an interstate transporter and marketer of natural gas. The FPC reduced the rates charged by Hope as excessive. The court properly used the statutory standard of justness and reasonableness, saying at 320 U.S. 602:

> "If the total effect of the rate order cannot be said to be unjust and unreasonable, judicial inquiry under the Act is at an end."

In this case however, the just and reasonable standard is not the only criterion. The Commission is now not only establishing rates to be collected under existing contracts but initial rates to be certificated under Section 7 of the Natural Gas Act. Thus it must establish initial rates not on the "just and reasonable" standard under Sections 4 and 5 but "in keeping with the public interest" under Section 7(e) of the Natural Gas Act. Surely the "public interest" is sufficiently broad to also encompass the interest of that portion of the public who lives in the States of Texas and New Mexico.

The *Hope* case was decided in January of 1944, ten years before *Phillips Petroleum Co. v. Wisconsin,* 347 U.S. 672, which pronounced the Federal Power Commission's jurisdiction to set the price of gas at the wellhead. In the *Hope* case the Supreme Court was reviewing the order of the Commission in fixing the rate of return and cost of service for one interstate pipeline company and not the wellhead price for gas to producing companies in a large geographic area. In the present case it is the gas producers who are being regulated while at the time of the *Hope* case they were completely exempt from Federal Power Commission regulation. The wellhead price of gas was not even involved in the *Hope* case. There the Commission and the Court were concerned with what should be included in the cost of service of Hope in order for it to realize a reasonable rate of return. The court remarked in passing that "the Federal Power Commission was given no authority over the production or gathering of natural gas" 320 U.S. 611, which indicates the extent of the evolution of this field of law since 1944.

Another distinguishing factor is that in the *Hope* case the impact on West Virginia was indirect and relatively insignificant, whereas in this case the impact on New Mexico and Texas is direct and greater in amount than on any other party in the case.

It must be realized that the interest of the producing states is going to have a direct effect on the interest of the consumer states and both interest must be given weight in determining wellhead prices for gas.

These Petitioners respectfully submit that any language in the *Hope* case which might be construed as preventing the Commission from considering the producing states as being "a part of the public interest" should be clarified or reversed, and that the court set down guidelines for the Commission to follow to insure equal protection of the interests of the producing states with those of the consumer states.

WHEREFORE these Petitioners respectfully pray that the Court grant a Writ of Certiorari to the United States Court of Appeals for the Tenth Circuit to review the questions presented herein.

Respectfully submitted,

PROOF OF SERVICE

I, Linward Shivers, attorney for Petitioners herein, and a member of the Bar of the Supreme Court of the United States, hereby certify that, on the 14th day of April, 1967, I served copies of the foregoing Petition for a Writ of Certiorari on Richard Solomon, Attorney for the Federal Power Commission, by mailing a copy in a duly addressed envelope, first class mail, postage prepaid, at the Federal Power Commission, Washington, D. C. I have further furnished a copy of this Petition for a Writ of Certiorari to all the other parties of record in these proceedings.

LINWARD SHIVERS

FEDERAL POWER COMMISSION, STATE OF CALIFORNIA jointly with PUBLIC UTILITIES COMMISSION OF THE STATE OF CALIFORNIA, CITY OF LOS ANGELES, CITY OF SAN DIEGO, CITY AND COUNTY OF SAN FRANCISCO, PACIFIC GAS AND ELECTRIC COMPANY, PACIFIC LIGHTING SERVICE AND SUPPLY COMPANY jointly with SOUTHERN CALIFORNIA GAS COMPANY and SOUTHERN COUNTIES GAS COMPANY OF CALIFORNIA, SAN DIEGO GAS AND ELECTRIC COMPANY, *Respondents.*

PETITION FOR A WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

Petitioner prays that a writ of certiorari issue to review the judgment of the United States Court of Appeals for the Tenth Circuit in this case entered on January 20, 1967.

OPINIONS BELOW

Opinion No. 468 of the Respondent, Federal Power Commission (hereinafter termed "Commission") (J.A. X/516d-XI/826d)[1] is reported at 34 F.P.C. 159. Opinion No. 468-A (J.A. XI/1105d) is reported at 34 F.P.C. 1068. The opinion of the Court of Appeals, printed in Appendix A hereto, *infra*, pp. 1a-44a, is reported in — F. 2d —.

JURISDICTION

The judgment of the Court of Appeals for the Tenth Circuit was entered on January 20, 1967 (Appendix B, p. 45a). This Petitioner filed no petition for rehearing with the court below; however, petitions for rehearing filed by other parties below are pending before that court.

The jurisdiction of this Court is invoked under Section 19(b) of the Natural Gas Act [15 U.S.C. § 717r(b)] and Chapter 81 of the Judicial Code, 28 U.S.C. § 1254.

QUESTIONS PRESENTED

By its Opinion No. 468 the Commission purported to determine just and reasonable rates for the first time on a group basis. The rates fixed by the Commission were predicated on averages of costs derived from a number of sources. The Court of Appeals for the Tenth Circuit affirmed the group method of fixing rates and the averages employed by the Commission, but set aside the opinion because there was no finding that group revenues would equate to group costs and no adequate "savings clause" provision whereby individuals in the group could, upon proper showing, be exempted from the group rates. The questions presented by this petition are:

(1) Whether the Federal Power Commission can fix just and reasonable rates under Sections 4 and 5

[1] "J.A." references are to the joint appendix in the court of appeals. Roman number references are to the volume number and arabic number references are to the page.

of the Natural Gas Act by a group method which wholly ignores the inability of individual producers to recover their operating expenses and capital charges at the rates fixed.

(2) Whether the court below, having properly accepted the fundamental principle that group rates must be based on evidence which is typical and representative, can lawfully affirm the use of basic data and averages which the Commission did not find to be typical and representative.

(3) Whether agency expertise is a proper substitute for requisite Commission findings that the basic data and averages it used were typical and representative.

(4) Whether the court below could lawfully refuse to decide due process questions arising from the lack of evidentiary standards and the Commission's subsequent use of data which could not be cross-examined or rebutted on the ground that the court should confine its consideration to "errors of law".

(5) Whether the Court below erred in its advisory statement that the Commission could constitutionally exclude from an individual company's cost of service legitimate expenses such as those incurred in drilling dry wells in the search for natural gas.

STATUTES INVOLVED

The statutory provisions involved are Sections 4 and 5(a) of the Natural Gas Act [15 U.S.C. §§ 717(c) and 717 (d)(a)] and Section 7(c) of the Administrative Procedure Act [5 U.S.C. § 1006(c)]. They are printed in Appendix C hereto.

STATEMENT OF THE CASE

1. History of Producer Rate Making

These proceedings are another chapter in the Federal Power Commission's efforts to fix just and reasonable rates under the Natural Gas Act [15 U.S.C. §§ 717-717(w)] for the sale of natural gas for resale in interstate commerce by independent producers. The Commission's jurisdiction over independent producers was determined by this Court in the *First Phillips* case, *Phillips Petroleum Co.* v. *Wisconsin*, 347 U.S. 672 (1954). The Commission thereupon initiated efforts at regulating producer rates without having first announced standards for its regulation. When the producers undertook to support their rates, however, the Commission dismissed their presentations. On appeal, these dismissals were reversed with the direction that the producers be allowed the opportunnity to support their rate increase application with a cost showing at least as a point of departure, *Bel Oil Corporation* v. *Federal Power Commission*, 255 F. 2d 548 (5th Cir. 1958), *cert. den.*, 358 U.S. 804.

The Commission then turned to an individual company cost method of fixing rates. A number of such proceedings were disposed of by Commission approval of settlement agreements, and only one major company-wide cost case reached Commission decision, *Phillips Petroleum Company*, 24 F.P.C. 537 (1960). In that case the Commission found that Phillips' current prices were fully justified by its costs (24 F.P.C. at 546), and dismissed its investigation of those prices. Nevertheless, the Commission found that the method of finding costs it had used was unworkable and indicated that it was establishing a new approach to producer rate regulation based on industry financial requirements rather than individual producer costs. In its concurrent *Statement of General Policy No. 61-1*, 24 F.P.C. 818 (1960), the Commission preliminarily established geographical pricing areas and price standards to be used as

a guide in issuing certificates of public convenience and necessity and in suspending rate increase filings.

An appeal was taken to the Commission's *Phillips* rate decision. In argument before this Court in the *Phillips* case, the petitioners therein contended that the Commission had erroneously relied on its intention to institute area rate proceedings as its reason for dismissing its investigation of Phillips' prices and not proceeding to a final determination of just and reasonable rates in that case. In a 5-4 decision this Court upheld the Commission in the *Second Phillips* case, *Wisconsin* v. *Federal Power Commission*, 373 U.S. 294 (1963). The majority held that "the lawfulness of the area pricing method * * * [was not itself] before the Court for review" (373 U.S. at 308). The majority also found, however, that it had "no indication that the area method will fall short of statutory or constitutional standards" (373 U.S. at 309). The dissent expressed serious doubts of "both the wisdom and the legality of this approach to price determination * * *" (373 U.S. at 327), and noted that it was "* * * both premature and dangerous to pass any judgment at this stage of the proceedings" (373 U.S. at 326).

2. The Instant Proceedings

The Commission instituted the Permian Basin Area proceedings here under review by order issued December 23, 1960 in Docket No. AR61-1 (24 F.P.C. 1121) (J.A. IX/1d). Prior to the commencement of hearings the Commission ruled that it would not permit cost of service studies on either an individual or group basis (J.A. IX/29d). Thereafter, however, the Commission on August 2, 1961 (J.A. IX/38d), ordered the filing of cost data in response to questionnaires sent out to 458 out of the some 2,600 Permian producers (J.A. IX/75d, 79d). The Commission then reversed its prior ruling excluding any cost of service study and provided that it would permit cost of service studies on

a composite basis. Cost of service studies on an individual basis were still to be excluded, however (J.A. IX/68d).

Of the 458 questionnaires sent out, 173 responses containing cost data were received and of these 136 were used by the Commission staff to obtain averages. The Commission made only minimal efforts to obtain more complete and usable data (J.A. III/1068-70, IV/1150-1).

At the hearing, the individual responses to the Commission questionnaires were not made a part of the record and were not sponsored by the company personnel who prepared them. Instead, the data in the responses were totaled and presented in composite form by Commission staff witnesses. These witnesses, however, were unable to explain patent inconsistencies on the face of the data which made the data incapable of being composited. Also, the staff witnesses were wholly unable to testify as to the accuracy of the data reported by the individual companies in the questionnaire responses or to be cross-examined thereon.

Because of the lack of representativeness of the basic data and the inability to cross-examine such data, Petitioner, during the course of hearing, moved that the composites of the questionnaire responses be stricken. Also, Petitioner moved that the proceeding be dismissed by reason of this failure of proof and the basic unlawfulness of the group method as it was being undertaken. Shortly after the hearing ended, Petitioner sought to submit evidence previously unavailable which further showed that the basic data was incompatible and, hence, could not be composited. This added evidence was a summary of responses to a counter-questionnaire in a subsequent area rate proceeding which showed extensive disagreement among producers in the instant case as to the meaning of certain key questions in the Commission's questionnaires. The record was not reopened to receive this evi-

dence; the Commission never ruled on Petitioners' motion to strike and dismiss, and the composited responses formed the basis for the rates ultimately fixed.

Petitioner also sought, during the course of the hearings, to submit its individual cost of service in support of its current rates and in rebuttal to the staff presentation. This was rejected as were the presentations of other producers which had sought to make similar showings (J.A. III/1080-1, V/1905-6). In addition, Petitioner's counsel was not permitted to cross examine an array of individual costs of service submitted by a Commission staff witness to the extent such cross-examination would have disclosed the identity of individual companies which had not been revealed on the array (J.A. IV/1145-9, 1167-9).

3. The Commission's Opinion

The Commission's Opinion No. 468, issued August 5, 1965, adopted a two-price system of ceilings on the rates for gas produced in the Permian Basin. In fixing the ceiling price for old gas (gas contracted for prior to January 1, 1961), the Commission used a weighted average derived from only some 40 of the 136 questionnaire responses the Commission staff had composited. No findings were made as to the representativeness and typicality of the averages, however, and only very limited findings were made as to the representativeness of the questionnaire data which was used. Notwithstanding these latter findings, the questionnaire data was otherwise rejected as unrepresentative.

The Commission claims to have achieved representativeness for the questionnaire data by excluding from its consideration cost data filed by some 107 small producers and by rejecting cost data on the production and processing of casinghead gas which is produced in conjunction with oil. The result of the Commission's limited efforts to obtain basic data and its rejection of much of the data that was

obtained was that the purported historical cost of all gas flowing in the Permian Basin Area was computed from data obtained from some 40 out of 2,600 producers and covered only 15% of total production in the area.

In using weighted averages without finding that the result was typical or representative, the Commission ignored holdings of this Court that weighted and unsifted averages are suspect. In addition the Commission ignored the unrebutted testimony of a professional mathematician submitted by Petitioner who testified that in view of the extreme dispersion of the basic data it is unlikely that average costs could be obtained which would be representative within usuable limits (J.A. V/1624, 1626-7).

Weighted averages of data from the questionnaire responses were also used, along with other data sources, in deriving the basis for the new gas price fixed in Opinion No. 468. The other data sources used included the Census of Mineral Industries and trade journal, bank, and industry association surveys. None of this data was supported by witnesses who could testify either to the basic figures or the compositing of them. Additionally, the standard for the Commission's selection of the data sources is undefined and apparently non-existent since both the questionnaire responses and one of the industry surveys were variously rejected as unrepresentative, but otherwise extensively used.

After finding what purported to be group costs as noted above, the Commission fixed ceiling prices for old gas and for new gas based upon such costs. Admittedly, however, group revenues from such prices would not recover group costs. This was due to certain quality differentials by which the prices were reduced and the presence of contract limitations which would not permit producers to collect up to the ceilings. Also, the costs found did not allow for gathering and processing costs of the producers. In addition, the only opportunity provided the individual to show the im-

pact of the rates found, *i.e.*, whether these rates would permit his recovery of costs, was by a proviso that at some time in the indefinite future, individuals would be allowed to show that "out-of-pocket costs" were not being recovered as the basis for rate relief or abandonment of service.

4. The Proceedings on Appeal

Following issuance of Opinion Nos. 468 and 468-A, individual appeals were taken pursuant to Section 19(b) of the Natural Gas Act [15 U.S.C. § 717r(b)] by Petitioner and a large number of other producers, as well as by the States of Texas and New Mexico. The appeals were heard by the Court of Appeals for the Tenth Circuit in view of the first filing of a petition for review with that Court by Skelly Oil Company, located in that Circuit. Other appeals were subsequently transferred to the Tenth Circuit pursuant to the provisions of 28 U.S.C. 2112(a), or were filed therein by acquiescence of the Commission.

In its appeal Petitioner pointed out that from a constitutional and statutory standpoint rates fixed pursuant to the Natural Gas Act must be just and reasonable as to the individuals regulated. With this the case, Petitioner argued that group rate making was not appropriate under this statute as this Court had previously found in *Bowles* v. *Willingham*, 321 U.S. 503, 517 (1944). In any event, however, Petitioner pointed out that in accordance with the minimal constitutional and statutory criteria set forth in a long series of cases under the Natural Gas Act, the rates fixed must afford individuals regulated the opportunity to recover their operating expenses and capital charges. In accordance with the holding of this Court in the *New England Divisions* case, *Akron, C. & Y. R. Co.* v. *United States*, 261 U.S. 184 (1923), Petitioner showed that if group rate making were found to be necessary (which Petitioner disputes), evidence of the group used in fixing rates must be typical and representative of the individuals in the group.

Also, the individual must be afforded the opportunity to rebut any claim that the group evidence used is typical and representative as to itself and to except itself from the group rates on proper showing.

With respect to Opinion No. 468, Petitioner showed that the Commission had failed to give any consideration to whether individuals could recover their operating expenses and capital charges at the rates fixed and in fact on the face of the record a large number of producers could not recover such costs. Also, the Commission failed to make proper findings of typicality and representativeness of the basic data and the averages derived therefrom and failed to allow individual cost of service presentations. This precluded rebuttal to the basic data used and to the matter of typicality and representativeness. In addition it denied individuals the opportunity to make a showing upon which to except themselves from the rates fixed. Petitioner also showed that, by reason of many due process errors arising from the use of evidence that could not be cross-examined or rebutted and the failure to fix or follow regulatory standards, such findings as were made were not supported by reliable, probative and substantive evidence as required by Section 7(c) of the Administrative Procedure Act, 5 U.S.C. § 1006(c).

5. The Determination of the Court Below

The court of appeals decision issued January 20, 1967 remands the case to the Commission because the Commission failed to equate group revenues to be achieved with group costs found. This, the court holds, is not in accord with the "end result test" of *Federal Power Commission* v. *Hope Natural Gas Company,* 320 U.S. 591 (1944). In addition, the Court recognizes that the individual must be afforded the opportunity to show the impact of the rates fixed on itself, and remands the proceeding to the Commission for the development of definitive standards and a

tangible procedure by which the individual may make such a showing.

With respect to the fundamental question of the Commission's power to enter upon group rate making, the court holds that the Commission has such power, apparently based on an impression derived from the Commission that this method is required by the necessities of procedure and administration (App. A, pp. 16a-19a). The opinion does not relate the power to fix group rates directly to the fundamental constitutional and statutory proposition that the individual must be afforded the opportunity to recover its operating expenses and capital charges. Nevertheless, the court does recognize that costs must be typical and representative both as to the basic data and the averages obtained therefrom (App. A, p. 29a).

Despite its recognition that the typical and representative criteria are applicable and that weighted averages are suspect in making typical and representative determinations, the court below does not discuss Petitioner's contentions that there were no adequate findings of the typicality and representativeness of basic data and averages and no support for such findings that were made. Rather, the court below relies wholly on the expertise of the Commission in this regard. (App. A, p. 29a). This complete acceptance of the Commission's "expertise" is apparently part of the court's refusal to review a number of important evidentiary issues such as the Commission's reliance on hearsay evidence, the deprivation of the right of cross-examination, and other matters of procedural due process. To consider these issues, the court states, would increase its opinion to "encyclopedic dimension" and draw it into "a turmoil of numbers." Therefore, the court below confines its opinion only to what it terms "errors of law" (App. A, pp. 22a-23a).

Like the case of the typical and representative criteria the court of appeals also renders ineffectual its determina-

tion that the individual must be afforded the opportunity to make an individual showing. While providing that an escape clause for the individual must do more than protect against unconstitutional confiscation and must be specific (App. A, p. 33a), the opinion otherwise holds that expense items contained in an individual cost-of-service including dry-hole expense are not a measure of a confiscatory rate (App. A, p. 32a). Since dry-hole expense is necessarily a major outlay of any producer that takes upon itself the finding of new reserves, the failure to recognize this item severely restricts the producer's opportunity to recover its operating expenses.

REASONS FOR GRANTING THE WRIT

(1) These proceedings involve an important question of Federal law which has not been, but should be, settled by this Court. Fundamentally that question is whether the basic constitutional and statutory standards for fixing rates for individuals pursuant to the Natural Gas Act may be ignored, as the Commission did in Opinion No. 468, or rendered ineffectual by complete and unquestioning reliance on the Commission's expertise, as the court of appeals did in its determination.

The Natural Gas Act is a major Federal regulatory statute designed for individual regulation of natural gas companies[2] and until now applied on that basis both to pipe lines and producers. By the action of the Federal Power Commission here under review the statute would be transformed to authorize a mass system of price control to be applied to large groups of companies. If such transformation is proper, it can be so only if the fixing of group rates can be reconciled with minimal constitutional and statutory criteria. These criteria provide that the individual must be afforded the opportunity to recover its operating ex-

---

[2] *Bowles* v. *Willingham*, 321 U.S. 503, 517 (1944).

penses and capital charges.[3] This Court has approved a method for reconciling a group approach to a statute providing for individual regulation by requiring that the evidence used must be typical and representative of the group and that the individuals in the group should be afforded the opportunity to rebut any contention of typicality and representativeness and to except themselves from the group order on proper individual showing.[4] The Commission gave no recognition to these limitations and criteria.

Although the court below accepts the applicability of the typical and representative criteria as to both basic data and averages and further accepts the need that individuals be afforded the opportunity to make a presentation, nevertheless, the court's further holdings in effect vitiate these fundamental principles. With respect to representativeness and typicality, the court of appeals' total acceptance of the Commission's expertise ignores the absence of findings on these matters and the substance of this Honorable Court's clear holdings that weighted averages are suspect for such a determination.[5] Moreover, the complete acceptance of the Commission's expertise is simply a further aspect of the court's refusal to review procedural due process questions on the ground that it would be drawn into a turmoil of numbers and was considering only "errors of law."

[3] *Federal Power Commission* v. *Natural Gas Pipeline Company of America*, 315 U.S. 575, 607 (1942); *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U.S. 591, 603 (1944); *Colorado Interstate Gas Company* v. *Federal Power Commission*, 324 U.S. 581, 605 (1945).

[4] *Akron, C. & Y. R. Co.* v. *United States (New England Divisions Case)*, 261 U.S. 184, 196-199 (1923).

[5] *United States* v. *Abilene and Southern R. Co. (The Orient Case)*, 265 U.S. 274 (1924); *Northern Pacific R. Co.* v. *Department of Public Works*, 268 U.S. 39 (1925); *Interstate Commerce Commission* v. *Mechling*, 330 U.S. 567 (1947).

The criterion for group rate making providing that the individual should be afforded the opportunity to make an individual presentation is also rendered of little effect by other of the court's holdings. Thus, the court's advisory statement that a company's failure to recover its expenses, including dry-hole expenses, is not a measure of what constitutes confiscation would deny to the producer the right to recover a major portion of expenditures that are indispensible in providing a gas supply. In addition, from the standpoint of the instant petition, this holding gives rise to a most fundamental constitutional question of what is confiscation.

The importance of the above issues is illustrated by the fact that there is being determined the pattern by which rates for the sales in interstate commerce of the vast natural gas producing industry will be hereinafter fixed. The determination herein is not, however, limited to natural gas producers or even to the Federal Power Commission. There is being additionally tested the latitude afforded any regulatory agency in adopting a group rate approach under the Constitution and under a statute providing for fixing rates of the individuals regulated. Indeed, this Court's expression of the power of a regulatory agency to fix group rates, its limitations in doing so, and the type of evidence on which it may rely, could well determine the future course of every Federal and state regulatory agency and every regulated industry. The fact that these issues have not been previously resolved by this Court is well illustrated by the reservation to this effect in both the majority and the dissenting opinions of the *Second Phillips* case, as previously noted (*supra*, p. 5), and as found by the Tenth Circuit (App. A, p. 14a).

(2) Another important reason for the grant of this petition is that the decision of the court below has, in the words of Rule 19 of this Court, "so far departed from the usual

course of judicial proceedings, * * *, as to call for an exercise of this court's power of supervision."

The action of the court of appeals in declining to review important procedural due process issues because of their claimed complexity in effect constitutes an affirmance of the Commission by default. It would thus appear that for a regulatory agency to avoid reversal, its action need not be legally supportable—only complex.

Petitioner recognizes the tremendous task facing any court reviewing a case of this magnitude, and the tendency of a litigant to attempt to draw the reviewing court into a *de novo* determination of all points in which it has been unsuccessful below. Accordingly, this Petitioner made every effort to limit its presentation to what it considered clear errors of law within easy comprehension of any court, eschewing argument on the Commission's many errors of law and fact which could be termed "substantial evidence questions." Nevertheless, the court below has lumped together all arguments directed at the propriety of the Commission's cost determination as too complex for its consideration.

The court of appeals' erroneous holding that it is confining its consideration to "errors of law" while declining to take up objections which it admitted to run "from hearsay evidence through deprivation of right of cross-examination to denial of procedural due process" (App. A, p. 23a) amounts to an immensely constricted view of what are "errors of law." If followed in other proceedings the discretion of regulatory agencies would be sharply expanded and the function of courts of review would be correspondingly contracted. Petitioner submits that this restriction of the scope of court review should not be permitted without the fullest consideration by this Court.

(3) Another aspect of the court of appeals' determination which requires review by this Court is its conflict with applicable decisions of this Court.

This Court has on numerous occasions reviewed just such issues as the court of appeals refused to consider, including the use of raw report data without affording the opportunity to cross-examine and rebut such data, *Northern Pacific R. Co.* v. *Department of Public Works*, 268 U.S. 39 (1925); *United States* v. *Abilene and Southern R. Co.*, 265 U.S. 274, 287-289 (1924); *West Ohio Gas Company* v. *Public Utilities Commission of Ohio*, 294 U.S. 63, 70 (1935), the use of weighted averages without findings of typicality and representativeness, *United States* v. *Abilene and Southern R. Co.*, 265 U.S. 274 (1924); *Northern Pacific R. Co.* v. *Department of Public Works, supra; Interstate Commerce Commission* v. *Mechling*, 330 U.S. 567, 583 (1947), and the general question of procedural due process as applied to administrative hearings, *Morgan* v. *United States*, 304 U.S. 1, 18-19 (1938). In addition the need for a tribunal below to clearly articulate the reasons for its determinations has been many times noted by this Court, *Virginian R. Co.* v. *United States*, 272 U.S. 658, 674-5 (1926); *Lawrence* v. *St. Louis-San Francisco R. Co.*, 274 U.S. 588, 596 (1927); *Cleveland C. C. & St. L. R. Co.* v. *United States*, 275 U.S. 404, 414-415 (1928); *Beaumont, S. L. & W. R. Co.* v. *United States*, 282 U.S. 74, 86-87 (1930), and actions which were not thus supported have been summarily reversed because the Supreme Court is not called upon unaided by opinion and finding to search a voluminous record, *Public Service Commission of Wisconsin* v. *Wisconsin Telephone Co.*, 289 U.S. 67, 70-71 (1933); see also *B. & O. R. Co.* v. *United States*, 279 U.S. 781 (1929).

A reviewing court cannot accept as expertise the determination of a regulatory body made without findings and analysis, *Burlington Truck Lines* v. *United States*, 371 U.S. 156, 167 (1962), and cannot interject its own discretion or that of the agency's appellate counsel as a substitute for the findings and analysis that the agency should have made, *Burlington Truck Lines* v. *United States, supra*, at 169; *N.L.R.B.* v. *Metropolitan Life Insurance Co.*, 380 U.S. 438,

443-444 (1965). Yet the Commission failed to make either adequate findings or analysis respecting the vital question of whether the basic data and averages are representative and typical, and the court of appeals rationalized the absence of such findings and analysis by blindly accepting the Commission's action as a product of its expertise. It is submitted that this was in direct conflict with the cases cited above.

CONCLUSION

For the foregoing reasons, this petition for writ of certiorari should be granted.

Respectfully submitted,

On Petition To Review Orders of the Federal Power Commission

Before LEWIS, BREITENSTEIN and HILL, Circuit Judges.

BREITENSTEIN, Circuit Judge.

The first area rate decision of the Federal Power Commission is before us for review. It relates to prices for jurisdictional sales of natural gas produced in the Permian Basin, a famous petroleum area where oil and gas are found in hundreds of reservoirs and thousands of wells. The states of Texas and New Mexico, the nation's oil and gas industry, and several related associations attack the decision. The State of California, the cities of San Francisco, Los Angeles, and San Diego, various local distributors, and an organization of such distributors support it. The rejection of the individual company cost-of-service approach to the regulation of independent producers and the adoption of the area rate method raise many novel issues which have been extensively and ably argued. We hold that neither the United States Constitution nor the Natural Gas Act bars the regulation of natural-gas prices on an area basis; that the Commission did not abuse its discretion in adopting the area method; and that the cases must be remanded because the actions of the Commission do not comply with the end result test established in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602-603, and other decisions.

The petitions for review, all brought under § 19(b) of the Natural Gas Act,[1] attack Opinions Nos. 468 and 468-A of the Commission fixing just and reasonable rates under §§ 4 and 5 of the Act for natural gas produced in the Permian Basin and sold to interstate pipeline companies.

1. *Background.*

The Permian Basin, as defined by the Commission, includes Texas Railroad Commission Districts Nos. 7-C, 8, and 8-A and the New Mexico counties of Chaves, Eddy, and Lea. Nationally, it accounts for about 11% of all the gas sold in interstate commerce. The Commission joined 336 producers as respondents in the consolidated proceedings. Sales by them are made to three interstate pipelines, none of which appear here.[2] About 85% of the Permian gas moving interstate goes to California.

Nearly two-thirds of the Permian gas production come from oil-well gas, that is, gas produced in conjunction with oil. Because of impurities much of the gas must be processed before introduction to an interstate pipeline. Until El Paso began its purchases, Permian oil-well gas was generally vented or flared because of the lack of a market.

The natural-gas industry has three main parts, the producers, the interstate pipelines, and the distributors. The last are under state or local regulation exclusively. The Commission began federal regulation of the interstate pipelines after the passage of the Natural Gas Act of 1938.

---

[1] 15 U.S.C. §§ 717-717w.

[2] El Paso Natural Gas Company began buying Permian gas in 1945, Northern Natural Gas Company through a predecessor in 1954, and Transwestern Pipeline Company in 1958. In 1961, El Paso purchased 73% of the Permian gas moving in interstate commerce, Northern 18%, and Transwestern 9%.

It did not attempt to regulate independent producers[3] until the 1954 decision of the Supreme Court in Phillips Petroleum Co. v. Wisconsin, 347 U.S. 672, (First Phillips) which held that the Act applied to them.

Section 7 of the Act forbids the sale of natural gas subject to Commission jurisdiction without a certificate of public convenience and necessity granted after notice and hearing. Temporary certificates, issued without notice and hearing, are authorized. Our recent decision in Sunray DX Oil Company v. Federal Power Commission, 10 Cir., —— F.2d ——, discusses § 7 procedures and problems. These are not present here because the § 7 applications considered in the consolidated proceedings before the Commission were disposed of in a separate order.

Section 4 requires that all rates shall be just, reasonable, and nondiscriminatory. No change shall be made in a rate without 30 days' notice. When a schedule containing a changed rate is filed, the Commission on its own initiative or on complaint may suspend the rate and set the matter for hearing. The suspension may be for not longer than five months. If no decision is reached within that period, the increased rate becomes effective but the Commission may require a bond conditioned upon the refund of that portion of the increased rate found not to be justified. The instant proceedings involve a number of increased rate filings which were suspended under § 4 and which were disposed of by Opinions Nos. 468 and 468-A.

Section 5 provides that whenever the Commission, after hearing had on its own motion or on complaint, finds that a rate is "unjust, unreasonable, unduly discriminatory, or preferential" it shall determine "the just and reasonable

---

[3] The word "independent" is used to describe a producer which does not transmit gas interstate either by its own operations or those of an affiliate. Some of the interstate pipelines produce a share of their own gas and sell gas to other pipelines.

rate." In the proceedings at bar the Commission pursuant to § 5 established "the future rates for jurisdictional sales of gas by producers in the area."

After the First Phillips decision the Commission received thousands of certificate applications from producers. The situation was complicated by the need of pipelines for a committed source of supply sufficient to justify financing. To obtain such supply long-term contracts, commonly for 20 years, were made with the producers. They in turn, because they could not file unilaterally for an increased rate contrary to contract and because they desired protection against the unforeseeable economic conditions of the future, insisted on escalation clauses of various types.[4] A general price rise occurred. As the escalation provisions became operative the producers filed under § 4 for increased rates and the Commission suspended many of them. Section 7 applications were under contracts calling for rates comparable to those which the Commission had suspended. This trend was ended by the 1959 decision in Atlantic Refining Co. v. Public Service Commission of New York, 360 U.S. 378, (CATCO) which directed the Commission in certificate cases to keep initial prices in line.

After the remand in First Phillips, the Commission proceeded with the consideration of just and reasonable rates required by §§ 4 and 5 on the individual company cost-of-service basis which it had long applied in the regulation of electric power companies and interstate pipelines. The first case to reach the decisional stage was that relating to Phillips. On September 28, 1960, the Commission entered Opinion No. 338[5] in which it held that the regulation of independent producers under the Act could be accomplished more appropriately by the establishment of area rates

---

[4] See Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F.2d 241, 243.

[5] 24 FPC 537.

than by the establishment of producer rates on individual cost-of-service findings. Contemporaneously with this Phillips decision, the Commission promulgated its Statement of General Policy No. 61-1[6] which established 23 rate areas and, with unimportant exceptions, announced maximum rates for each area. Two price standards were set, one for initial prices in new contracts and one for escalated prices in existing contracts. For the Permian Basin area the prices were 16 cents and 11 cents respectively.

Opinion No. 338 was affirmed by the Court of Appeals for the District of Columbia Circuit[7] and by the Supreme Court in Wisconsin v. Federal Power Commission, 373 U.S. 294, 310, (Second Phillips) wherein the Court observed that it shared "the Commission's hopes that the area approach may prove to be the ultimate solution" to the problem of regulating the independent producers.

The first area rate proceeding was that for the Permian Basin and was initiated on December 23, 1960.[8] It was followed by a similar proceeding for the South Louisiana area,[9] for the Hugoton-Anadarko area,[10] and for the Texas Gulf Coast area.[11] The last three are in the hearing stage. The Permian Basin proceeding was decided by Opinions Nos. 468 and 468-A to which we turn.

2. *The Decision of the Commission.*

The 131-page original opinion, No. 468, followed by the 23-page opinion denying rehearing, No. 468-A, need only

[9] Docket No. AR61-2, 25 FPC 942.

[10] Docket No. AR64-1, 30 FPC 1354.

[11] Docket No. AR64-2, 30 FPC 1354.

be summarized at this point. The Commission found the area rate principle free from constitutional and statutory objections and adopted it. Contract prices were rejected as a basis for regulation and the reserves to production ratio was declared to be an inappropriate regulatory standand. The Commission set up a two-price system. It differentiated between gas produced as the sole product of a well, referred to as gas-well gas, and gas produced in association with oil, known as oil-well gas or casinghead gas. One price was established for new gas-well gas and the residue therefrom sold under contracts made on or after January 1, 1961. A second price was established for flowing gas which was defined to include gas-well gas sold under contracts executed before the mentioned date, casinghead gas, and residue gas derived from either source. The January 1, 1961, date of division between new gas-well gas and old gas-well gas was adopted because that was the approximate date when the industry became able to direct its exploration efforts toward finding gas-well gas as distinguished from finding gas as a by-product in the search for oil. For new gas-well gas the Commission fixed a rate of 16.5 cents per Mcf for the Texas Railroad Districts inclusive of state and local taxes and a rate of 15.5 cents per Mcf for the New Mexico counties exclusive of applicable state and local production taxes. For flowing gas the respective rates were 14.5 cents and 13.5 cents.

In determining these rates the Commission gave consideration to composite costs but treated the two categories of new gas-well gas and flowing gas differently. It said that the price of the former "was geared to the cost of finding and producing future gas supplies and as such was built up primarily from nationally published statistics and the questionnaire data." For flowing gas it said "our touchstone is the historical cost of gas being produced in the Permian Basin area."

The Commission required adjustment on an individual company basis from the stated prices to reflect differentials

from the quality standards. These downward adjustments are determined "by the net cost of processing the gas to bring it up to standard." A downward adjustment is also required if the Btu content is less than 1,000 per Mcf and an upward adjustment is permitted if that content is above 1,050.

Small producers, defined as those making less than 10 million Mcf of jurisdictional sales annually, are exempt from the quality adjustments and from certain filing requirements.

The Commission set a minimum price of 9.0 cents per Mcf. Provision is made for special exemption from area rates. Refunds of excess collections are required on an individual company basis. The possibility of changes in area rates is recognized. A moratorium, until January 1, 1968, is declared on rate increases and indefinite escalation clauses are prohibited.

Three commissioners filed separate opinions. With one exception Commissioner O'Connor approved the results reached but said that "the contract price at which most producers are able and willing to operate is just and reasonable" and that "composite costs best serve as a check on average field prices to preclude significant price departures." He disapproved the Btu adjustment saying that an upward adjustment should be applied for all gas having a Btu content in excess of 1,000. Commissioner Ross was critical of accounting methods used and pointed out the need for simplification. He dissented from the division date between new and old gas-well gas. In his view the new gas-well gas price should apply to gas sold after the date of the Commission decision. Commissioner Black said that the allowed 12% rate of return on net investment "is very probably a generous one" but was justified by the special risk of finding substandard gas in the Permian Basin.

3. *Disqualification of Two Commissioners.*

The Continental Group of petitioners urges that Commissioner Black was disqualified to participate in the decision. The Independent Petroleum Association of America, (IPAA) complains of the participation of both Commissioners Swidler and Black. The claim is that each of them had prejudged the issue of whether substantial competition existed among producers. Additionally, Commissioner Black is accused of personal bias against the producers. The charges stem from public addresses made in 1964.[12] No claim is made that either commissioner prejudged the ultimate issue of a just and reasonable rate. In our opinion no basis for disqualification arises from the fact or assumption that a member of an administrative agency enters a proceeding with advance views on important economic matters in issue. Nothing in the record disturbs the assumption that the two commissioners are "men of conscience and intellectual discipline, capable of judging a particular controversy fairly on the basis of its own circumstances."[13] The cases cited by Continental and IPAA are not in point.[14]

---

[12] A motion for the disqualification of Commissioner Black was made to and denied by the Commission. We find no similar motion in the record pertaining to Commissioner Swidler.

[13] United States v. Morgan, 313 U.S. 409, 421. See also Federal Trade Commission v. Cement Institute, 333 U.S. 683, 700-703.

[14] In Texaco, Inc., v. Federal Trade Commission, D.C. Cir., 336 F.2d 754, vacated 381 U.S. 739, the charge was precommitment of a commissioner on the guilt of an accused. In Gilligan, Will & Co. v. Securities and Exchange Commission, 2 Cir., 267 F.2d 461, certiorari denied 361 U.S. 896, a similar charge was made against a commission. Amos Treat & Co. v. Securities and Exchange Commission, D.C. Cir., 306 F.2d 260, related to a charge against a commissioner who had previously served as a staff member in the investigation which led to the complaint.

4. *Objections of Texas and New Mexico.*

The states of Texas and New Mexico, besides adopting the briefs and arguments of the Continental Group, assail the Commission decision on grounds peculiar to them in their governmental capacity. They say that the public interest, which the Commission is required to protect, includes the producing states as well as the consuming states; that the prices which the Commission has set will cause a cessation or curtailment of exploration and development activities to the serious injury of the economy of the Permian Basin; that waste rather than conservation of a natural resource will result; and that the states and their public entities will suffer severe losses in taxes and royalty payments.[15] Similar arguments were made by West Virginia in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 607-614, and were rejected by the Supreme Court which said that when Congress passed the Natural Gas Act it "was quite aware of the interests of the producing states in their natural gas supplies" and that nothing in the Act intimates that high prices should be maintained so that "the producing states obtain indirect benefits." The rejection of the state's contentions in Hope requires the rejection of the same contentions here.

Texas and New Mexico also argue that the Commission has unlawfully interfered with their power of taxation. The Commission fixed the rates of gas produced in Texas to include all state taxes and in New Mexico to exclude such taxes. It said that: "In the event of any increase in taxes in Texas or New Mexico, the Commission will consider whether ceiling prices shall be increased and, if so, to what extent." The states' arguments are premature. The Commission has allowed all present taxes as a cost item. Nothing in the Commission decision inhibits the

[15] In Texas 4.7 million acres of public lands are within the Permian Basin and in New Mexico over 3 million acres. Much of this land is leased for oil and gas and produces royalty income.

states from increasing those taxes. The Commission has said that if they do, it will determine whether such increases should be passed on to the consumer or remain on the shoulders of the producers. The question of whether increased state taxes will unreasonably burden interstate commerce is hypothetical at this stage.

New Mexico complains that the establishment of a ceiling price plus existing taxes for gas produced in its portion of the Permian Basin denies to it the power to provide a tax incentive to producers by reducing the tax. The argument is not persuasive. If the New Mexico tax was reduced, the Commission could properly consider a rate decrease to reflect the tax decrease.

5. *Legality of Area Rates for Permian Basin.*

The problems confronting federal regulation of the natural-gas business, and particularly the independent producers, have been discussed several times [16] and need be only summarized. The interstate gas business is concerned with a wasting, nonreplenishable natural resource subject to production after discovery. At the point where the gas enters interstate commerce there are few buyers and thousands of sellers. The producers range from the financially powerful integrated oil companies to the wildcatters who operate on a shoestring. Their results are measured by the amount of gas produced—not by the amount of money invested. Exploration and development costs are financed out of current income and are charged to ex-

[16] See opinions of Justice Jackson dissenting in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 628, and concurring in Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 608; dissenting opinion of Justice Douglas in First Phillips, 347 U.S. 672, 687; dissenting opinions of Justice Clark in First Phillips, 347 U.S. 672, 690, and in Second Phillips, 373 U.S. 294, 315; dissenting opinion of Justice Harlan in Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 159; and Opinion No. 338 of the Commission, 24 FPC 537, 542-548.

pense rather than capital. The uncertainty of the business causes substantial cost and revenue fluctuations not only from producer to producer but also from year to year for the same producer. A regulated commodity, gas, is produced in substantial quantities along with an unregulated commodity, oil. The allocation of costs between them baffles the experts and presents the temptation to use mathematical means of arriving at a predetermined result. The same rate may bring a financial windfall to one producer and a financial disaster to another. The price of gas must be competitive with that of other sources of energy and must be sufficiently attractive to encourage a continued search for new supplies.

In Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 582, a case relating to pipeline rates, the Court held that the provisions of the Act were consistent with the due process clause of the Fifth Amendment and within the commerce power. Another pipeline case, Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602, says that in fixing rates the Commission is "not bound by the use of any single formula or combination of formulae"; that "under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling"; and that the impact of the rate order rather than the theory behind it is the governing criterion. The "end result" test of Hope was followed in Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 605-606.

Second Phillips, 373 U.S. 294, holds that the Commission did not abuse its discretion in terminating the § 5 investigation of Phillips' rates and substituting an area basis for an individual company basis. The Court reaffirmed the principles announced in Natural, Hope, and Colorado Interstate, recognized the difficulties inherent in the regulation of the price of natural gas, shared the Commission's hope for the success of the area approach, and observed

that the "case might be different if the area approach had little or no chance of being sustained."[17] At the same time, the Court pointed out that "the lawfulness of the area pricing method" was not before it for review.[18] Four justices dissented in an opinion which characterized the area rate policy of the Commission as "a new, untried, untested, inchoate program which, in addition, is of doubtful legality."[19]

In Callery[20] the Court mentioned that the § 7 proceedings before it had at one time been consolidated with the South Louisiana area rate proceedings. Contrary to the argument of the California Distributors the Court did not, tacitly or otherwise, approve area rate regulation. The most pertinent comment is that of Justice Harlan in his concurring and dissenting opinion who said that area pricing "ultimately aims to simplify proceedings under the statute."[20a]

We cannot accept the arguments of the Commission and the California groups that the Supreme Court has determined the validity of area pricing under the Act. We read the decisions to mean that the Court has permitted the Commission to go forward with the area rate experiment and wishes it good luck in the development of a workable procedure which will be free from constitutional and statutory pitfalls.

Governmental price regulation of services and commodities on a group or geographical basis has been up-

held in a number of decisions[21] under the federal commerce and war powers and under state police powers. Those supporting the Commission place great reliance on these decisions. The producers painstakingly distinguish each from the case at bar. We decline to be drawn into these tortuous sidepaths because we are convinced that the "translation of an implication drawn from the special aspects of one statute to a totally different statute is treacherous business."[22] Specific reference need be made to only one decision. Several producers emphasize the statement in Bowles v. Willingham, 321 U.S. 503, 517, that in the Natural Gas Act "Congress has provided for the fixing of rates which are just and reasonable in their application to particular persons or companies." The argument is that by this language the Supreme Court has recognized that regulation under the Act is on an individual company rather than group basis. We do not agree. The statement is dicta and whatever value it might have had as dicta was, in our opinion, destroyed by the blessing which the Court gave area rate making in Second Phillips.

Producers urge that the language of the Act is contrary to regulation on a group basis because all pertinent references to natural-gas companies are in the singular. First Phillips holds that an independent producer is a "natural-

[22] Federal Trade Commission v. Bunte Bros., 312 U.S. 349, 353.

gas company" within the purview of the Act. Section 2, the definitions section, provides that "person" means an individual or corporation, and defines "natural-gas company" to mean a person engaged in transportation or sale of natural gas in interstate commerce. Section 4, covering the filing and changing of rates, refers to "any natural-gas company," "no natural-gas company," "every natural-gas company," and "the natural-gas company." Section 5, authorizing investigation and determination of rates, refers to "any rate," by "any natural-gas company" and to "such natural-gas company." Section 7 provides for certificates of public convenience and necessity and uses the terms "a natural-gas company," "no natural-gas company" and "such natural-gas company." The repeated use of the singular rather than the plural is said to require that the just and reasonable rate of each particular seller be tested with reference to its peculiar circumstances and operations.

Opposing arguments point out that the Act does not prohibit group or area rate making and that § 16 empowers the Commission to perform any and all acts and to prescribe such orders, rules, and regulations "as it may find necessary or appropriate to carry out the provisions of this act."

The basic query is whether the just and reasonable standard applies on an individual company basis or on a group basis. Section 4(a) says that "all rates * * * made * * * by any natural-gas company * * * shall be just and reasonable * * *." If this means that each producer is entitled to a rate which will return its costs plus a reasonable profit, the inquiry is at an end because the Commission refused to receive individual cost figures.

The Natural, Hope, Colorado Interstate, and Second Phillips decisions all support the conclusion that in the regulation of natural-gas rates the Commission is not bound by any formula or method, and that the choice of

the appropriate method for the determination of those rates lies in the sound discretion of the Commission. The appropriateness of the method depends on the peculiar characteristics of the natural-gas industry.

In its Opinion No. 338,[23] the Commission noted the reasons why the individual company cost-of-service method was inapplicable and unworkable. Among these were the lack of a fixed determinable relationship between investment and service to the public with the result that "a huge investment might yield only a trickle of gas, while a small investment might lead to a bonanza," the staggering allocation problems which could result in such anomalies as widely varying prices for gas coming from a jointly owned lease or even from a jointly owned well, and the intolerable administrative burden of requiring a separate rate determination for each of the several thousand independent producers.

The powerful contrary argument is that no area rate, whether based on composite costs, average aggregate costs or any other industry wide criteria, will suffice to assure a high cost producer of its costs to say nothing of a profit. We accept this as true.[24] The impact of an area rate in the natural-gas industry may have effects which cover the entire range from bonanza to bankruptcy. It is sufficient for us that these results were lucidly demonstrated

---

[23] 24 FPC 537.

[24] An appendix to the Hunt brief presents an array of natural-gas costs of 44 Permian producers whose volumes total over 208 million Mcf. Of these, 16 producing over 170 million Mcf are shown to have costs of less than 14.5 cents. The remainder have costs running from 14.77 cents to 216.05 cents. We have been unable to check the accuracy of these figures and mention them only to show the claimed disparity of costs. Continental says that "approximately 67 percent of the companies and approximately 30 percent of the volumes had costs above the industry average cost level."

in the dissenting opinion of Justice Clark in Second Phillips and did not deter the majority from allowing the Commission to proceed with its area rate program.

Some of the producers argue that if the Act is construed to permit area rate making, the Act is invalid under Art. I, § 1, of the United States Constitution because no legislative standards have been set for establishing groups or making group determinations. Reliance is had on Panama Refining Co. v. Ryan, 293 U.S. 388, which held that a delegation of legislative power to the President was unconstitutional because Congress, among other things, "has declared no policy, has established no standard, has laid down no rule."[25]

Congress cannot delegate its power to enact laws but it can confer on an administrative agency the power to carry into effect laws which it has enacted.[26] In the New England Divisions Case, supra, the Court referred to the power given by Congress to the Interstate Commerce Commission to determine just and reasonable rates and said that Congress "intended that a method should be pursued by which the task * * * could be performed."[27] In Lichter v. United States, 334 U.S. 742, 785-786, the Court in discussing legislative standards said that the "standards prescribed by Congress are to be read in the light of the conditions to which they are applied" and for an example observed that "among those which have been held to state a sufficiently definite standard for administrative action [are] 'just and reasonable' rates for sales of natural gas."

---

[25] 293 U.S. 388, 430.

[26] Crain v. First National Bank of Oregon, Portland, 9 Cir., 324 F.2d 532, 537.

[27] 261 U.S. 184, 197.

In the regulation of the natural-gas industry "the actual necessities of procedure and administration" [28] have led to the adoption of the area rate method. We believe that neither constitutional nor statutory provisions prevent the use of that method and that the Commission did not abuse its discretion in adopting it. The more important and difficult question is that of the validity of the area rates which have been established. The controlling standard is the end result test of Hope. In our opinion, this test is accepted by, and reaffirmed in, the Second Phillips decision.

Some of the producers urge that the area rate method is not consistent with the characteristics of the industry and that contract prices satisfy statutory requirements because they have been reached through effective competition. The Commission considered and rejected the argument. It pointed to the history of price negotiatons in the Permian Basin, to the urgent requirements of the pipelines, to the heavy percentage of sales by a few producers, and to the control of undisclosed and uncommitted gas reserves by a few producers. It concluded that the record fails to establish that a just and reasonable rate can be established through competition and that "the primary competition revealed by the record was among the pipelines to secure new gas supplies at higher prices." Commissioner O'Connor disagreed saying that "the contract price at which most producers are able and willing to operate is just and reasonable." His conclusion was that "profit oriented costs and supply oriented contracts do not, in the aggregate, depart in any significant manner from each other." We accept the conclusion of the Commission that competition has not been effective to fix a just and reasonable rate. It is supported by reasonable inferences from the record and they are binding on us.

---

[28] Id. at 198.

Continental and Superior say that they were improperly denied an opportunity to be heard on the geographical propriety of the Permian Basin as a rate area. In its order instituting the proceedings the Commission eliminated the issue of the appropriateness of the area for rate making purposes.[29] The Commission may draw on its expertise to determine the ground rules for an investigation but in so doing may not deny a specific right.[30] The producers fail to convince us that any such denial has occurred here. The Permian Basin is a well known area. Unless prices are to be determined on a national basis, areas must be selected and defined. The Commission had two choices. It could first determine the national revenue requirement and divide that up among the areas or it could first determine the various rates so that in the aggregate they meet that requirement. We are unwilling to assume that when all the area proceedings are completed the total revenue will not equal the national requirement. If it does not, both the producers and the consumers will suffer. In our opinion the Commission acted reasonably in selecting the Permian Basin for an area rate proceeding.

6. *The Two-Price System.*

The Commission's two-price system is vigorously attacked on many fronts. It will be remembered that one price is fixed for new gas-well gas and another for flowing gas. All agree that gas is a commodity which is valuable as a source of energy. The householder does not care whether the gas which burns at the tip of his appliance comes from a gas well, an oil well, or as a residue product. To him gas is gas.

---

[29] 24 FPC 1121, 1122.

[30] Amax Petroleum Corporation v. Federal Power Commission, 10 Cir., 350 F.2d 92, 94.

The justification for the two-price system is that the higher price for new gas-well gas provides an incentive to explore for and develop new supplies. The producers do not question the finding that "the industry is increasingly becoming able to direct its exploration efforts toward finding new gas-well gas as distinguished from finding gas as a by-product in the search for oil." This ability may be confined to the larger companies which maintain the technical staffs skilled in making the necessary predictions. The smaller producers are in a less advantageous position. They may be relegated to the farmouts which the majors pass down to them or to operations in accord with their less scientific but sometimes financially rewarding hunches.

New gas discoveries are well said to be the life blood of the industry. The consumers may reasonably be required to pay the price needed to bring forth such discoveries. If an incentive price based on current costs is used for all gas, windfalls will be assured to many producers of old gas developed under lower historical costs and often found in association with oil.

The producers say that a single-price system based on current costs is required because revenues for current exploration and development must be internally generated from sales of gas from whatever source. The Commission rejected the argument. The question is not so much the source of the funds as it is the inducement to use available funds in the search for gas. The higher price for new gas is intended to supply that inducement. Although the adequacy of the inducement can only be tested by future developments, we are not convinced that the refusal of the Commission to include the same inducement in the price of old gas, with the resulting likelihood of windfalls, was unreasonable.

Continental, Phillips, and others argue that the two-price system amounts to entrapment because of the possibility of

reduction in price after financial commitments have been made. Although the Commission which announced the Permian Basin decision cannot bind a future Commission, we credit the Commission with good faith. The possibility of a change does not invalidate the rate method employed. When and if a reduction occurs, the argument of entrapment can be heard.

The division date of January 1, 1961, for the different prices of new gas-well gas and old gas-well gas is another subject of dispute. Here the Commission found as a fact that the appropriate date was the approximate time when directional drilling came to be used effectively. Under the evidence the selection of a division date was an administrative problem calling for the exercise of judgment. In making its choice the Commission acted within the evidence and within its powers. On rehearing, the Commission left open for future consideration the problem arising when new gas-well gas is developed from committed acreage. We assume that this problem will be met fairly when it comes to a head.

The two-price system is an outgrowth of directional drilling for gas. Its purpose is to assure a continued gas supply. The Commission frankly says that the adoption of the system for the Permian Basin "should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies." We find no persuasive reason why the test should not be made.

7. The Cost Information.

In arriving at the Permian Basin rates the Commission used many sources of cost information. These included responses to questionnaires sent to producers, the Census of Mineral Industries for 1958, the Chase Manhattan Bank's 1961 Annual Analysis of the Petroleum Industry,

the World Oil Magazine, the Oil and Gas Journal, the Joint Association Survey,[31] and others. The producers attack these sources on many and varied grounds. The range of objections runs from hearsay evidence through deprivation of right of cross-examination to denial of procedural due process. To take up each of these objections would increase the length of this opinion to encyclopedic dimensions.

From the information so obtained the parties, the staff, and the Commission make many computations and reach many results. The assumptions, allocations, formulae, equations, averages, means, and massive calculations may intrigue a mathematician or statistician but they have no attraction for us. We respectfully decline to be drawn into such a turmoil of numbers. We cannot in a few months unravel the snarl of statistics developed in the years of hearings. In our opinion the judicial process, in cases such as this, should be confined to consideration of errors of law. We leave to the experts the selection of source material and the calculations to be made therefrom. Our concern is with the result.

8. *The Commission's Price Determinations.*

The Commission said that "costs must be a major factor in determining the area price." On the basis of current

---

[31] This is a survey of a few producers conducted by the American Petroleum Institute, the IPAA, and the Mid-Continent Oil and Gas Association.

national statistics plus questionnaire data it determined the 1960 Mcf cost of new gas-well gas thus:

Exploration and Development Costs	
Dry Holes	1.42 cents
Other Exploratory Costs	1.59
Adjustment for Exploration in Excess of Production	1.11
Production Operating Expense	2.70
Net Liquid Credit	(3.10)
Regulatory Expense	.14
Depletion, Depreciation, and Amortization of Production Investment Costs	
Successful Well Costs	2.88
Lease Acquistion Costs	.76
Cost of Other Production Facilities	.31
Return of Production Investment (at 12%)	5.21[82]
Return on Working Capital	.35
Subtotal	13.37
Royalty at 12½ percent	2.05
Production Taxes	1.01
Total	16.43

The Commission rounded this figure off at 16.5 cents for the Texas production. Because the New Mexico figure is exclusive of taxes a reduction of one cent was made in the New Mexico price.

[82] This is computed as follows: The production investment is the sum of successful well costs, lease acquisition costs, and cost of other production facilities or a total of 3.95 cents. It is to be recouped over an average period of 10 years beginning an average of one year after investment. Accordingly, the return is allowed on an investment base 11 times the production investment of 3.95 cents per Mcf or 43.45 cents. 12% of this figure is 5.21 cents per Mcf.

For the costing of flowing gas the Commission used historical data developed by the industry questionnaires. The results may be summarized thus:

Production operating expenses	1.75 cents
Depreciation, depletion and amortization	2.42
Return at 12%	4.99
Exploration and development	4.08
Regulatory expense	.14
	13.38
State production tax at 7%	1.01
	14.39[33]

This figure was rounded off at 14.5 cents for Texas and 13.5 cents for New Mexico. As a check on the method used the Commission back-trended the new gas-well gas figures and arrived at a 14.64-cent price.

The rates so established are subject to downward adjustment because of quality deficiencies and to both downward and upward adjustments on the basis of Btu content. The Commission disclaims any intent that the rate figures show producer costs. It says that the price of new gas-well gas is "geared" to costs derived from national statistics and the questionnaire data and that for flowing gas the "touchstone" is the historical price of Permian gas.[34] Other undefined and unidentified "factors" were taken into consideration.

9. *The Moratorium.*

The Commission implemented the price provisions of the decision in various ways. It imposed a moratorium on rate increases until January 1, 1968, "except in compli-

[33] No separate item was included for royalty payments because costs were computed on 7/8 of actual volumes.

[34] In Opinion No. 468 the Commission said: "Nevertheless, we make clear that we do not confine ourselves to a cost calculation in determining just and reasonable rates."

ance with a specific order of the Commission for a rate as determined pursuant to said proceeding [AR61-1] or pursuant to later order of the Commission." The producers say this violates the Act because § 4 permits filings for rate increases. Section 4 must be read with other sections of the Act. Section 5 authorizes the Commission to determine the just and reasonable rate "to be thereafter observed and in force." Section 16 gives the Commission power to make such orders "as it may find necessary or appropriate to carry out the provisions of this act." In Callery the Court held that there was ample power under § 7(e) to impose a moratorium.[35] We believe that there is also ample power under §§ 5(a) and 16. The reasonableness of the exercise of the power is established by the need for price stability, the Commission's expressed willingness to reopen the proceedings to consider the propriety of changes, and the expiration date which is only about a year off.

10. *Escalation Clauses.*

The Commission's order forbids the filing of rate changes in excess of applicable area rates when the contractual right thereto is based on indefinite escalation clauses not permitted by § 154.93(a), (b), and (c) of the Regulations under the Natural Gas Act. The producers say that this provision destroys existing contract rights. The Commission replies that it has not proscribed the clauses but merely the right to file under them. This is a thin distinction. In Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F. 2d 241, 245, we upheld § 154.93 and pointed out that if a producer felt aggrieved thereby it could apply for a rule waiver under § 1.7(b) of the Commission's Rules of Practice and Procedure. We assume that a similar request could be made under the Permian order. When the request is made and rejected, the time will arrive for the consideration of the constitutional questions which the producers raise.

---

[35] 382 U.S. 223, 228.

11. *The Commission's Fair Relationship Standard.*

In fixing the amounts of the area rates the Commission rejected the end result test and adopted a fair relationship standard. This appears clearly from Opinion No. 468-A. After disclaiming that it had made any finding that "jurisdictional revenues will equate to jurisdictional costs," the Commission said:

> "* * * we are convinced that the record fully justifies the Commission's judgment that the ceiling prices we have fixed 'provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur' in the Permian Basin."

Hope says that in the fixing of just and reasonable rates there must be a "balancing of the investor and the consumer interests."[36] It goes on to say that from the company point of view the revenue must not only provide operation expense but also capital costs including "service on the debt and dividends on the stock"; and that the return to the equity owner must be commensurate "with returns on investments in other enterprises having corresponding risks" and "sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital."[37] The Court concluded the discussion of this problem with the observation that in Hope the "end result" could not be condemned as unjust and unreasonable.

In Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 605, the Court, after referring to the Natural and Hope decisions said:

> "In those cases we held that the question for the courts when a rate order is challenged is whether the order viewed in its entirety and measured by its end results meets the requirements of the Act."

CARD 7

Also pertinent is the statement of the Court in Second Phillips that:[38]

> "To whatever extent the matter of costs may be a requisite element in rate regulation, we have no indication that the area method will fall short of statutory or constitutional standards. The Commission has stated in its opinion in this proceeding that the goal is to have rates based on the 'reasonable financial requirements of the industry' in each production area, * * * and we were advised at oral argument that composite cost-of-service data will be considered in the area rate proceedings."

Nothing in Second Phillips rejects the end result test of Hope. We believe that it applies here and that it is not satisfied by a finding of fair relationship. Something more than mere semantics is involved. The determination of a fair rate from the standpoint of the consumers must depend to large extent on the informed judgment of the regulatory agency. In these proceedings no distributor, consumer interest, or consumer representative objects to the rates. They are accepted as just and reasonable.

From the standpoint of the producer the situation is different. It is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. These requirements must be tested against the record. They may not be brushed aside with a general finding of fair relationship. The Commission concedes that it did not equate jurisdictional costs to jurisdictional revenues. This is obvious because no determination was made of the jurisdictional revenues which the rates will produce.

12. *The High Cost Operator and the Small Producer.*

The Commission broke down the rates into components which it justified on averages based on national statistics

---

[38] 373 U.S. 294, 309-310.

and questionnaire data. We recognize that weighted averages and sifted averages are suspect.[39] We accept the principle that both the basic figures and the averages obtained therefrom must be typical and representative but we are not convinced that the Commission has misused its expertise in this technical field. It is self-evident that when average costs are used to compute ceiling prices, the high cost operator will be hurt and some low cost operators may receive windfalls. Probably to a greater extent than in any other comparable segment of the national economy the element of chance can affect the success or failure of even the most prudent entrepreneur who engages in the natural-gas business.

The problem of the high cost operator is characteristic of group or area rate making. The Supreme Court upheld group rates in Acker v. United States, 298 U.S. 426, 431, and commented that "regulation cannot be frustrated by a requirement that the rate be made to compensate extravagant or unnecessary costs." In Tagg Brothers v. United States, D.C. Neb. 29 F. 2d 750, 755, affirmed 280 U.S. 420, the court said that it was not necessary "to fix the rates so high that all agencies in the business would make money." Covington & Lexington Turnpike Road Company v. Sanford, 164 U.S. 578, 596, says that "the public cannot properly be subjected to unreasonable rates in order simply that stockholders may earn dividends."

The small producers, represented here by Big Chief Drilling Company, IPAA, Texas Independent Producers & Royalty Owners Association (TIPRO), J. C. Barnes, and others, join in the prediction that the Permian decision sounds the death knell of the small producers. Perhaps the flamboyant wildcatter must be replaced by the scientists of the industrial giants but the efforts of the

---

[39] See United States v. Abilene & Southern Railway Company, 265 U.S. 274, 291, and Interstate Commerce Commission v. Mechling, 330 U.S. 567, 583.

boom-or-bust adventurers have contributed greatly to natural-gas discoveries. In its decision the Commission referred to the "smaller independent who traditionally drills much of the Permian exploratory acreage" and said that: "Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators who contribute a large share of the discoveries of new sources of gas." [40]

The Commission took note of the suggestions that small producers should be exempt from regulation.[41] It found that outright exemption was neither necessary nor desirable but said that the small producers needed "special treatment." To this end it defined a small producer as "a natural gas company selling jurisdictionally less than 10,000,000 Mcf annually on a nation-wide basis." They were granted relief from various requirements of §§ 7 and 4 and were freed from rate adjustments because of quality differentials. In our opinion the classification is reasonable and within the Act.

The small producers do not seek complete exemption. Their attitude is that such relief would be illusory rather than real because the pipelines would not pay more for gas supplied by them than the price paid to the major companies. Their complaint is that the Commission did not give adequate consideration to small producers' costs.

Data covering the costs of Permian producers came from questionnaires which are classified as Appendix B and Appendix C. The Appendix B group was mandatory for

---

[40] Big Chief asserts that the small producers, although credited with only 20% of current production volumes, actually drill almost 40% of all successful gas wells and 50% of all successful exploratory gas wells.

[41] See statements of Justice Clark dissenting in Second Phillips, 373 U.S. 294, 329-330, and speaking for the Court in Federal Power Commission v. Hunt, 376 U.S. 515, 527.

producers with company-wide jurisdictional sales of over 10 million Mcf and optional for others.[42] The Appendix C questionnaires went to the small producers. Forty-two of the majors and 25 of the small producers answered Appendix B. The response to the Appendix C questionnaires was sporadic. The Commission used only the material supplied by the majors saying that the inclusion of the data supplied by the small producers "does not affect the results."

TIPRO and Big Chief both emphasize the testimony of a staff witness that the small producer questionnaire showed average unit costs 2 cents per Mcf higher than those of the majors. They argue that the end result standards must be applied not only to the entire group but to them as a group. The weakness of the argument is that once the whole group is split the process can be carried on until the regulation is back on an individual company basis.

We do not know the answer to the small producer problem. Superficially it seems unfair to fix ceiling prices for all producers, both large and small, on the basis of the costs of large producers only. The Commission rejected the small producer data because in its opinion the impact on the rate structure was de minimis. On the record presented, we are unwilling to say that this conclusion was erroneous as a matter of law.

In any regulation of the natural-gas industry on an area basis the high cost producers, be they majors or little fellows, are certain to be placed in a position less advantageous than that occupied by those whose good fortune and able management have supplied a lower cost base. We agree with the Commission that the expense items included in an individual cost-of-service are not the

---

[42] Appendix A pertained to well and drilling statistics. It is not pertinent here.

measure of a confiscatory rate. A producer has no constitutional right to be reimbursed for dry-hole expenses.[43] Also it has no obligation to remain in business by replenishing the supplies of gas which form the basis of present obligations. Inability to continue exploration and development is not confiscation. We conclude that the impact of the Permian rates on the high cost producers does not destroy the area rate method.

13. *Gathering and Processing Costs.*

One subject of much discussion in the briefs is the allowance of the same rate for gas delivered at the tailgate of a processing plant and for gas delivered at the wellhead. Gathering lines cost money and have to be built and operated by someone. The Commission's position is that the revenues received for oil and oil products derived from condensation and processing return a profit which induces the building of the needed gathering lines and plants. Here again we reach the troublesome field of cost allocations between a regulated commodity, gas, and unregulated commodities, oil and liquified petroleum products.

Bass places particular emphasis on this phase of the case. It points to its extensive investments in gathering lines and plants and to its permanently certificated rate of 18 cents which, it says, the Commission has never specifically found unreasonable or discriminatory. The answer as we see it is that if area rates are proper no greater need exists for the consideration of the individual cost and revenue requirements in the case of Bass than in the case of the other producers. Perhaps in the future courts will have to explore the mysteries of allocations but we are not so inclined in this case. If in fact Bass and others similarly situated are confronted with confiscation, a way must be open for them to be heard.

---

[43] Cf. Columbus Gas & Fuel Co. v. Public Utilities Commission of Ohio, 292 U.S. 398, 407.

14. *Special Exemptions.*

The Commission recognized that some provision must be made for special exemption from area rates. It said that when a producer's "out-of-pocket expenses in connection with the operation of a particular well are greater than the revenues under the applicable area price, he should be entitled to appropriate relief." It declined to "specify all of the special circumstances which may serve as a basis for exceptions to the area rate" and observed that failure to earn exploration and development expenses plus the allowed return does not amount to confiscation. In regard to the form of relief it held that "it may be sufficient to permit them to abandon their unprofitable sales."

We agree with the Commission that an escape clause cannot be used to convert an area rate into an individual company cost-of-service rate but an escape clause which does no more than prevent an unconstitutional confiscation amounts to nothing. None is needed for that purpose. The producers are right in saying that the Commission's exemption provisions are so vague and nebulous that neither they nor a court can determine what relief is being granted. Out-of-pocket expenses are not defined and we do not know what they include. If a producer's accounting is on a lease rather than well basis, the facts relating to a particular well might not be determinable. It may be going too far to say categorically that individual producers should be permitted to show that the group costs are not typical or representative of their costs but in some instances that should be permitted. Conservation of gas is promoted if marginal wells are allowed to continue to produce but is discouraged if the same wells are shut down by a low price. Some producers furnish gathering facilities. Others sell at the wellhead and the pipelines pay for the gathering. Gathering costs are allowed pipelines. Perhaps in some instances they should be allowed to producers. An adequate savings

clause should contain guidelines which if followed by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided. It is not enough to say in effect that confiscation will be prevented. Confiscation is an individual proposition and the individual is entitled to be heard. We are convinced that the Commission's special exemption provisions are inadequate.

15. *Quality Standards.*

The Commission provided for adjustments in the area rates to reflect quality differentials. It said that "the price of gas cannot be related to volume alone but must be related to units of energy free of impurities and sufficiently compressed to enter the pipeline." Standards were fixed for content of carbon dioxide, hydrogen sulphide, total sulphur, water, and other impurities; and the amount of delivery pressure was established. The applicable base area rate is adjusted downward by the net cost of processing the gas to bring it up to standard. Provision is made for both an upward and a downward adjustment of rate depending on the Btu content. Quality statements are required to be filed together with an agreement by the seller and the buyer covering the cost of bringing the gas up to standard. If an agreement cannot be reached, each shall file a statement of its views on the processing costs.

About 90% of the flowing gas is substandard. We are cited to no figures on the similar percentage of new gas-well gas. The amount of the rate adjustments does not appear in the record because there was no evidence of the extent of quality differentials or of the processing costs of bringing the gas up to standard.[44] At oral argument various estimates were given as to the amount of

[44] The Commission says in its brief that "appropriate price differentials or adjustments could not be made on the basis of the record."

rate reduction which would result from substandard quality. These were based on statements filed pursuant to the decision but after the record was closed. They ranged from .7 cents to 2.0 cents per Mcf. A spokesman for the Continental Group said that on 1960 volumes a revenue deficiency of some $12 million a year would result. The Commission response in this court to the Skelly motion for stay of the Commission's orders herein said that the reductions in applicable rates because of adjustments for quality standards are expected to result in a revenue reduction of about $10 million annually.[45]

The producers' argument that the imposition of quality standards violates procedural due process because of lack of notice need not be resolved at this time. We are remanding the case and now everyone has notice. The matter of the Btu adjustments presents a particular problem which was emphasized by Commissioner O'Connor in his dissent that the price goes down if the Btu content is below 1,000 and goes up if it is above 1,050. The producers say the adjustment upward should begin at 1,000. We do not understand the Commission's reasons for the gap. On remand this can be clarified.

16. *The Rate of Return.*

The Commission says that the impact of the quality adjustments is taken care of in the rate of return which is made generous on this account. It fixed a rate of return of 12% on production activities and held that such rate "protects gas consumers against excessive prices but it is not so low that it fails to respond to the needs of the

---

[45] The statement was this: "It has been estimated that the reductions to the base rates alone will reduce the revenues from jurisdictional Permian sales by about $10 million annually. The adjustments for quality standards, which were substantially altered by Opinion 468-A * * * are expected to result in a further reduction of the same magnitude."

industry." The principles applicable to the determination of an appropriate return are set forth in Bluefield Water Works & Improvement Co. v. Public Service Commission, 262 U.S. 679, 692-693. It "must be determined by the exercise of a fair and enlightened judgment, having regard to all relevant facts." The rates of a public utility should "permit it to earn a return on the value of the property * * * equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties" but the utility has no constutional right to profits realized by "highly profitable enterprises or speculative ventures." The return should assure "confidence in the financial soundness of the utility" and be adequate under prudent management "to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties." The Hope decision[46] states the same basic principles.

The Commission recognized these controlling principles. The objections of the producers are to the point that the allowed rate of return is inadequate to enable the industry to attain the goals which the principles contemplate. At this time there is no need for us to go into the comparisons of the returns appropriate for producers as opposed to pipelines or to the financing methods employed by either. The fact is that by treating quality deductions as a risk rather than a cost the Commission has made it impossible to determine the amount of return with any degree of certainty. The difficulty is that the record does not disclose the amount of deductions.

A fair rate of return cannot be ascertained with mathematical certainty.[47] Pragmatic adjustments may be made

---

[46] 320 U.S. 591, 603.

[47] Colorado Interstate Gas Co. v. Federal Power Commission, 10 Cir., 142 F.2d 943, 961\962, affirmed 324 U.S. 581.

by an agency within the ambit of its statutory authority.[48] A court must put great reliance on agency expertise in evaluating a rate of return but this does not mean that a court must accept the agency determination in blind faith. A producer is entitled to a higher rate of return than a pipeline because of the greater risk of the business. The Commission has here compounded the risk of discovery with the risk of substandard quality.

We believe that the price reductions to reflect quality deviations are an item of cost rather than an item of risk and should be directly reflected in the applicable base rates instead of hidden in a rate of return allowance. The amount of cost is the expense of bringing the quality up to standard. In the Permian Basin sound reason exists for this conclusion because of the known and substantial quality deficiencies particularly in flowing gas production. We find it hard to understand why a revenue deficiency in the estimated amount of $10 million annually should be classified as a risk and not a cost. A risk occurs as the result of unknown or unconsidered contingencies. In the Permian Basin it is known and considered that flowing gas falls short of pipeline standards. In any event, the lack of evidence as to quality deductions makes it impossible to determine whether the rate of return satisfies the Bluefield and Hope principles and we have no basis on which to appraise the allowance made by the Commission. We respect the expertise of the Commission but the conclusions reached by the use of expertise must accord with legal standards.

17. *Contract Limitations.*

The producers say that recovery of industry costs under the area rates is impossible because many of the existing contracts do not permit a producer to file for the flowing

---

[48] Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 586.

gas ceiling price of 14.5 cents. The Commission recognized that "there undoubtedly will be some contract prices lower than the area rate ceiling, as adjusted for quality." Some of the producers estimate the deficiency because of contract limitations to be $14.4 million in the test year of 1960. The Commission has estimated that a reduction of base rates alone will result in a revenue reduction of about $10 million annually.[49]

It is elementary that gas prices are originally set by contract between the producer and the pipeline, that the producer may not raise the price unilaterally, and that any increase in price must be within contract terms unless the price is set so low as to affect the public interest. The Commission says that the producers are not entitled as a matter of right to collect contract rates that are higher than otherwise reasonable in order to offset other rates limited by contract to below maximum reasonable levels. Regulation does not guarantee an over-all profit;[50] relief from an unduly low rate may be given only if the rate is "so low as to adversely affect the public interest—as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory";[51] and a company's losses in one instance do not justify an illegal gain in another instance.[52] At the same time in such group procedures as the division of railroad rates the Interstate Commerce Commission, with court approval, has recog-

---

[49] See supra, note 45.

[50] Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 590.

[51] Federal Power Commission v. Sierra Pacific Power Co., 350 U.S. 348, 355.

[52] Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, 153.

nized that revenue from one source may balance that from another.[53]

Contract limitations are one of the facts of life for the natural-gas industry. They are the outgrowth of the days when gas, which had previously been vented, flared, or capped, became salable to the newly constructed interstate pipelines. The pipelines wanted long-term contracts and the producers wanted to sell their gas. Prices were low. With the phenomenal increase in the use of gas as an energy source the prices rose. The producers whose contracts either contained no escalation clauses or clauses of the type proscribed by the Commission were in a disadvantageous position. Even permissible escalations do not, in many instances, bring the 1960 price up to the area ceiling. In Second Phillips the Court upheld the termination of certain § 4(e) dockets on the Commission's finding that "the annual increase in revenue produced by these increased rates was substantially less than the deficit for the test year 1954."[54] The same situation exists here for many companies. We do not know whether it exists for the area producers as a group because no finding was made of revenue and requirements. The Supreme Court has said that losses in one instance do not justify illegal gains in another. To us this means that the contract limitations do not preclude the establishment of a just and reasonable area rate. The answer is provision for a minimum rate.

The Commission held that "the establishment of minimum rates in this case is in the public interest and that the price impact on the consumer will be de minimis." It established a minimum rate of 9 cents per Mcf for gas of standard pipeline quality. We believe that the controlling question is whether the proper revenue requirements of the area producers as a group can be satisfied with rates

---

[53] See New England Divisions Case, 261 U.S. 184.

[54] 373 U.S. 294, 305.

having the ceiling and the floor which the Commission has fixed. This cannot be answered because the financial impact of the quality deductions is not ascertainable from the record.

18. *Refunds.*

The revenue deficiency argument of the producers leads directly to the refund issue. The Commission required "appropriate refunds in the case of rates which are the subject of proceedings under Section 4(e) of the Act, and have thus been collected subject to an obligation to refund amounts collected in excess of the just and reasonable rates as here determined." Procedures to accomplish this result were set up in detail.

The producers say that these individual company refunds are not proper because of the revenue deficiency of the industry. They say that in the test year of 1960 the producers in the area failed to meet their revenue requirements by $14.4 million and they estimate the refunds for that year under the Commission decision to approximate $6 million.

The Examiner held that refunds should be ordered only to the extent that over-all industry revenues exceed over-all industry expenditures in a given year. The Commission said that this theory was unworkable because it would result in inequities among both the buyers and the producers and because of "insurmountable" administrative difficulties. We are at a loss to understand how refund obligations, which might come into existence under the Examiner's approach, would be divided among the producers.

We see no escape from the requirement that refunds be on an individual company basis and on a schedule by schedule basis. As we understand Federal Power Commisison v. Tennessee Gas Transmission Co., 371 U.S. 145, 153, refunds are appropriate for each excessive rate

regardless of over-all revenues. The Commission has required refunds only on § 4(e) rate increases above the applicable area ceiling. If a producer claims that the refunds required of it are confiscatory or harmful to the public interest, it must have an opportunity to petition for special relief. A similar opportunity must be afforded if a producer can show that a refund is required for collections at or below the "last clean rate."[55] An adequate special exemption clause can take care of such situations.

19. *The End Result Test.*

This brings us back to the end result test. The Continental Group, which includes many large producers and major integrated oil companies and which is supported by Phillips, presents alternative arguments. The first is economic. It is said that regulation under the Act must be consistent with the economic characteristics of the industry; that this requires the establishment of market prices based on contracts; that a cost-based system of regulatory rates does not recognize the responsiveness of the gas supply to gas prices; and that a producer does not explore on the expectation of a return of its cost plus a return on its investment but on the hope of getting back many times what it expends as a reward for its gambler's risk. No doubt these are the economic facts of the industry.

The divorce of commodity value from costs was suggested by Justice Jackson in his dissent in Hope. He commented that a producer would have difficulty showing the invalidity of a fixed commodity value so long as it voluntarily continued to sell its product in interstate commerce.[56] One difficulty with this suggestion is that once

[55] By "last clean rate" is meant the last rate in effect pursuant to a permanent certificate not subject to any refund obligation.

[56] 320 U.S. 591, 652.

the gas is committed no withdrawal from interstate movement is possible without Commission approval.[57] A producer can stop exploration and development if it is dissatisfied with price but the interstate sales go on with a continuing impact of cost on price and of price on exploration and development. In any event the majority rejected the proposal and held that under the just and reasonable standard of the Act a regulated company is entitled to revenue for operating expenses and capital costs and to a return "commensurate with returns on investments in other enterprises having corresponding risks."[58] These standards cannot be met without consideration of costs and revenues. In our opinion the Hope construction of the statutory standard casts serious doubts on the validity of the adoption of a contract-based commodity value.

The alternate argument of the Continental Group is that if the rates are to be determined on a composite cost-of-service basis, the revenue requirements of the industry must be found and rates fixed to meet those requirements. In Second Phillips the Court particularly noted the assurance of the Commission that "composite cost-of-service data will be considered in the area rate proceedings."[59] Consideration of such data does not eliminate consideration of other factors. At the same time Second Phillips did not reject the end result test of Hope. Instead it quoted a portion of that opinion which said among other things that "it is the result reached not the method employed which is controlling."[60]

---

[57] Section 7(b) of the Act. See also Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 156.

[58] 320 U.S. 591, 603.

[59] 373 U.S. 294, 310.

[60] Id. at 309.

The Commission rejected both alternatives of the Continental Group. It said that commodity value established by contracts may not be used because of the absence of effective competition; and it emphasized that it took into consideration factors other than costs. The record does not disclose what these other factors were but they must have had some economic basis. The Commission held that its ceiling prices provided a "fair relationship" between consumer prices and producer costs. Fair relationship is pertinent but it is only part of the end result test. We do not know the producers' costs or revenue requirements. We do not know the economic factors which either require or permit departure from costs and revenues. The end result test is not satisfied by a reliance on unknowns.

We have accepted the Commission's conclusion that contract rates should not be used. The trouble is that the Commission decision rides two horses and we have no way of knowing the outcome of the race. It uses composite cost-of-service evidence, engrafts economic factors on top, and comes out with a rate which it justifies on a fair relationship basis. We have the problem of how in such circumstances a court can determine whether the just and reasonable standard of §§ 4 and 5 has been met. The answer is not found in the record before us.

The facts sustaining the conclusion of fair relationship must be found. The Commission did not make those findings and indeed it could not have done so because of the failure of the record to disclose the revenue impact of the adjustments in area rates to reflect quality differentials. Whether rate reductions because of quality deficiencies are a risk or a cost, the answer comes out the same. If they are a risk, we do not know the rate of return. If they are a cost, we do not know whether the revenue received will equal the reasonable revenue requirements. We believe that under Hope, and under Second Phillips, the area producers, as a group, are entitled to recover their prudent operating expenses and capital costs with a return com-

mensurate to the risk and sufficient to attract capital. Satisfaction of this requirement must appear through appropriate findings based on substantial evidence. These cannot be made on the record presented. The decision of the Commission is not saved by the special exemption provisions which we find to be insufficient and unsatisfactory.

Rate making under the Act has produced a superabundance of delay and litigation. Much gas has moved through the pipelines since the First Phillips decision. We wonder if the time has not come for the establishment of a better rapport among the Commission, the consumers, the distributors, the pipelines, and the producers. Some practical means of resolving the economic and legal issues is highly desirable. The Commission has approved many settlements. The use of this procedure may well be explored further in an effort to obtain a true "balancing of the investor and the consumer interests." [61]

One point remains to be mentioned. Eleven motions for leave to adduce additional evidence were filed with us by various producers. We deferred all to the hearing on the merits. In view of the disposition which we make of the cases we see no reasons to explore evidentiary problems which may arise on remand. The Commission will hold such additional hearings as are needed to determine the effect of the quality adjustments, and to determine the group revenues and the group revenue requirements. It will make appropriate findings on these matters. The order based thereon shall contain an adequate provision for special exemptions. We decline to make advance rulings on the procedures to be followed or on the evidence to be received.

The motions to adduce additional evidence are severally denied. The petitions to review are severally granted and the cases are all remanded to the Commission for further proceedings consistent with this opinion.

APPENDIX B

IN THE UNITED STATES COURT OF APPEALS
FOR THE TENTH JUDICIAL CIRCUIT
SITTING AT DENVER, COLORADO

Thirteenth Day, January Term,
Friday, January 20th, 1967.

PRESENT: Honorable Jean S. Breitenstein, Circuit Judge, and other officers as noted on the 19th day of January, 1967.

Before Honorable David T. Lewis, Honorable Jean S. Breitenstein and Honorable Delmas C. Hill, Circuit Judges.

8495

SUN OIL COMPANY, *Petitioner,*

v.

FEDERAL POWER COMMISSION, *Respondent.*

On Petition to Review an Order of the Federal Power Commission.

This cause came on to be heard on petition to review an order of the Federal Power Commission and motion to adduce additional evidence and was argued by counsel.

On consideration whereof, it is ordered by this court that the motion to adduce additional evidence is hereby denied. The petition to review is granted and the case is remanded to the Commission for further proceedings consistent with the opinion of the court.

A true copy as of record,

TESTE:

WILLIAM L. WHITTAKER
Clerk.

APPENDIX C

1. The Administrative Procedure Act, Section 7(c), 60 Stat. 241, 5 U.S.C. 1006(c) provides as follows:

(c) EVIDENCE.—Except as statutes otherwise provide, the proponent of a rule or order shall have the burden of proof. Any oral or documentary evidence may be received, but every agency shall as a matter of policy provide for the exclusion of irrelevant, immaterial, or unduly repetitious evidence and no sanction shall be imposed or rule or order be issued except upon consideration of the whole record or such portions thereof as may be cited by any party and as supported by and in accordance with the reliable, probative, and substantial evidence. Every party shall have the right to present his case or defense by oral or documentary evidence, to submit rebuttal evidence, and to conduct such cross-examination as may be required for a full and true disclosure of the facts. In rule making or determining claims for money or benefits or applications for initial licenses any agency may, where the interest of any party will not be prejudiced thereby, adopt procedures for the submission of all or part of the evidence in written form.

2. The Natural Gas Act, Sections 4 and 5(a), 52 Stat. 822-3, 15 U.S.C. 717c-717d(a) provides as follows:

SEC. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b) No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue pref-

erence or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c) Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services.

(d) Unless the Commission otherwise orders, no change shall be made by any natural-gas company in any such rate, charge, classification, or service, or in any rule, regulations, or contract relating thereto, except after thirty days' notice to the Commission and to the public. Such notice shall be given by filing with the Commission and keeping open for public inspection new schedules stating plainly the change or changes to be made in the schedule or schedules then in force and the time when the change or changes will go into effect. The Commission, for good cause shown, may allow changes to take effect without requiring the thirty days' notice herein provided for by an order specifying the changes so to be made and the time when they shall take effect and the manner in which they shall be filed and published.

(e) Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, State commission, or gas distributing

company[1a] or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time when it would otherwise go into effect;[1a] and after full hearings, either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natural-gas company to furnish a bond, to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and, upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas com-

ANSWER OF SUN OIL COMPANY TO JOINT BRIEF IN OPPOSITION OF INDICATED RESPONDENTS

Comes now Sun Oil Company ("Sun") in answer to the joint brief in opposition to its petition for writ of certiorari in No. 1292, which brief was filed on June 1, 1967 by a group of natural gas producers that are respondents in certain of the *Permian Basin Area Rate* cases (hereinafter referred to as "Texaco, *et al.*"). Texaco, *et al.* are respondents in Nos. 1293, 1295 and 1342 in which their brief is captioned; however, they are *not* respondents to Sun's petition in No. 1292 or to several other petitions to which the brief is also directed (fn. p. 1). Sun submits that the Texaco, *et al.* brief is materially in error where it seeks to characterize Sun's position, as well as in its characterization of the holdings of the court below and the holding of this Court in *Second Phillips, Wisconsin* v. *Federal Power Commission,* 373 U.S. 294 (1963).

(1) Texaco, *et al.,* erroneously groups Sun with Hunt Oil Company and Superior Oil Company and claims that this group challenges the constitutional and statutory basis for area rates *per se* (pp. 2, 14). To the contrary, Sun does not claim that area rates are *per se* improper. Instead Sun submits that group ratemaking may be undertaken only if proper consideration is given to the individuals in the group such as by the use of typical and representative evidence, as held by this Honorable Court in a long line of cases extending from the *New England Divisions Case*[1] through the Court's very recent decision in *Chicago and North Western Railway Co.* v. *The Atchison, Topeka and Santa Fe Railway Co.,* 35 L.W. 4481, 4485 (May 29, 1967).

(2) The Texaco, *et al.* brief in opposition also ignores Sun's fundamental position that there are important due process errors in these proceedings involving the basic data used. Texaco, *et al.* brief argues

[1] *Akron, C. & Y. R. Co.* v. *United States,* 261 U.S. 184 (1923).

that the Court of Appeals deemed it premature to review "subsidiary substantive issues" (p. 9), and that these issues are rate design issues which the court below "could not" review because they were buried in a "'turmoil of numbers.'" (pp. 9-10) Furthermore, the Texaco, *et al.* brief claims that the Tenth Circuit refused to be drawn into such a review because of the "patent inadequacy of the record and findings before it" (p. 10). This is not Sun's understanding of the Tenth Circuit's decision.

The issues Sun presents, and which the court below referred to in using the term "turmoil of numbers," are not "subsidiary" issues. Rather they are fundamental due process questions inherent in the Commission's group ratemaking method. Moreover, these due process issues go to the basic data used rather than to rate design as Texaco, *et al.* state. In addition the court below did not hold that review of these issues was premature, that it *could not* review these issues, or that the record and findings were so inadequate as to preclude review. Rather, the Court simply said that it *would not* review these issues because of their complexity. As noted in Sun's petition in No. 1292 (p. 15), this in effect constitutes affirmance of the Commission by default. The propriety of the Tenth Circuit's action is now open for this Court's review.

(3) The brief of Texaco, *et al.* (p. 14) is misleading in stating that the statutory arguments advanced by Sun were "not accepted" by this Court in *Second Phillips, Wisconsin* v. *Federal Power Commission, supra.* As shown by Sun's petition in No. 1292 (pp. 5 and 14) and further as found by the Tenth Circuit below (Appendix A to Sun's petition, p. 14a), this Court did not in *Second Phillips* rule on the propriety of the Commission's group ratemaking process as adopted herein.

This Court, in *Second Phillips* (with four justices dissenting), expressed a hope that the Commission could enter upon group ratemaking consistent with the statute and the constitution. It is Sun's position, however, that this Court's statements did not exempt the Commission from well-recognized constitutional and statutory limitations to group ratemaking, and these limits were not adhered to by the Commission. *Second Phillips* was not as an open-ended endorsement of whatever group method the Commission chose to employ and whatever evidence the Commission chose to rely on in pursuit of that method. Accordingly, Sun proposes to show this Court that the Commission in this initial attempt to enter upon group ratemaking wholly ignored fundamental due process considerations, as well as the constitutional and statutory limitations upon group ratemaking, not the least of which were those recognized in this Court's *Chicago and North Western* decision.

For the reasons stated above, Sun submits that its petition for a writ of certiorari is properly before this Honorable Court and should be granted.

Respectfully submitted,

OCTOBER TERM, 1966

No. .....

PEOPLE OF THE STATE OF CALIFORNIA and PUBLIC UTILITIES COMMISSION OF THE STATE OF CALIFORNIA,
Petitioners,

vs.

SKELLY OIL COMPANY, et al.,
Respondents.

Petition for a Writ of Certiorari to the United States Court of Appeals for the Tenth Circuit

The Petitioners, the People of the State of California and the Public Utilities Commission of the State of California, respectfully pray that a writ of certiorari issue to review the judgment of the United States Court of Appeals for the Tenth Circuit entered on January 20, 1967.[1]

1. Petitioners were intervenors in support of the Federal Power Commission, respondent in the court below. Respondents on this petition for a writ of certiorari were the petitioners in the court below.

OPINIONS BELOW

The opinion of the Court of Appeals is not yet reported, and is printed in Appendix A.[2] The Federal Power Commission's Opinion Determining Just and Reasonable Rates for Natural Gas Producers in the Permian Basin, Docket No. AR61-1, *et al.* (Opinion No. 468), and related orders, issued on August 5, 1965 (J.A. 516d-838d, 37s-40s),[3] are reported at 34 FPC 159, 418, and 424 respectively; and its Opinion and Order Denying Applications for Rehearing of Opinion No. 468, Docket No. AR61-1, *et al.* (Opinion No. 468-A), issued on October 4, 1965 (J.A. 1105d-1136d), are reported at 34 FPC 1068. Opinion Nos. 468 and 468-A are also printed in Appendix A.

JURISDICTION

The judgment of the Court of Appeals was entered on January 20, 1967. Petitioners herein did not petition for rehearing before the Court of Appeals.[4] The jurisdiction of this Court is invoked under the provisions of 28 U.S.C. 1254(1) and Section 19(b) of the Natural Gas Act.[5]

The following respondents have filed petitions for rehearing before the Court of Appeals: Shell Oil Company and

2. Printed separately in Appendices to Petition for Writ of Certiorari.

3. The Joint Appendix contains thirteen volumes which are paginated as follows: Volumes I through V, which contain only testimony, are paginated 1-1908. Volumes VI through VIII, which contain exhibits presented during the hearings, are paginated 1e-1146e. Volumes IX through XI, which contain pleadings, orders, and opinions, are paginated 1d-1157d. There are also two small volumes—a supplement numbered 1s-40s, and a separate volume containing the table of contents for Volumes I through XI.

4. Rule 26 of the United States Court of Appeals for the Tenth Circuit allows twenty days after judgment or decision to petition for rehearing.

5. Act of June 21, 1938, c. 556, § 19, 52 Stat. 831, as amended 15 U.S.C. 717(r) (1958).

Phillips Petroleum Company in Docket Nos. 8409 and 8489; Warren Petroleum Corporation, Gulf Oil Corporation, The British-American Oil Producing Company, Humble Oil & Refining Company, Cities Service Oil Company, Cities Service Production Company, Coltexo Corporation, Columbian Fuel Corporation, and Columbian Carbon Company in Docket Nos. 8440, 8493, 8534, 8497, 8488, 8493, and 8517; Standard Oil Company of Texas in Docket No. 8479; Mobil Oil Corporation (formerly Socony Mobil Oil Co., Inc.) and Northern Natural Gas Producing Company in Docket Nos. 8455, 8460, and 8588; Pan American Petroleum Corporation and Sinclair Oil & Gas Company in Docket Nos. 8458 and 8493; Texaco Inc., Amerada Petroleum Corporation, Atlantic Richfield Company, Southland Royalty Company, Westates Petroleum Company, Dorchester Gas Producing Company, Sunray DX Oil Company, Marathon Oil Company, Sohio Petroleum Company, and Tidewater Oil Company in Docket Nos. 8482, 8541, 8493, 8542, 8490, 8540, and 8494. These petitions for rehearing are pending at the present time. Petitioners will advise this Court of the determination of these petitions by the Court of Appeals as soon as possible.

QUESTIONS PRESENTED

1. In determining just and reasonable area rates under Sections 4 and 5 of the Natural Gas Act, must the Federal Power Commission, in order to satisfy the "end result" test set forth in *Federal Power Commission v. Hope Natural Gas Company*, 320 U.S. 591 (1944), determine the allowable area cost of service for the gas produced in the area, including an allowance for exploration to meet future demand for gas, find that such cost of service constitutes the area revenue requirement, and establish rates which will recover such revenue requirement; or may it determine area rates

CARD 8

which establish a fair relationship between the revenues derived from the rates prescribed and the allowable area cost of service?

2. Where *Federal Power Commission v. Sierra Pacific Power Company*, 350 U.S. 348 (1956), holds that voluntarily made contract rates, which are below the Federal Power Commission's subsequently determined just and reasonable rates, are not required to be raised to the same level as the just and reasonable rates unless the public interest so necessitates, must the Commission raise these low contract rates for the purpose of insuring that area revenues equal the Commission's determination of allowable area costs?

3. In establishing group ceiling rates applicable to pipeline quality gas, is the Commission's rate-of-return allowance of 12 percent adequate where specific recognition was given to the fact that lower quality gas commanding a lesser price might be found and where this possibility was treated as an additional risk?

4. Where the Federal Power Commission establishes just and reasonable area rates, and there is a possibility that some producers may require special relief from these rates, did the Commission err by establishing a special relief provision which announces that such producers may petition for relief, but which does not specify detailed guidelines for such relief?

5. Is the Federal Power Commission's area rate decision so vague and unclear with regard to the establishment of the "Btu gap" in its Btu quality standard that clarification is required?[6]

6. If certiorari is granted, we also reserve the right to argue two additional questions:
   1. Whether the Commission gave adequate notice that it would prescribe quality standards in this proceeding.
   2. Whether the area rates fixed by the Commission are just and reasonable within the meaning of the Natural Gas Act. (This question covers the issues which the court below failed to reach due to its remand order. Petitioners will ask this Court to affirm the Commission's decision in all respects.)

STATUTE INVOLVED

The relevant provisions of the Natural Gas Act, 52 Stat. 821, as amended, 15 U.S.C., Sections 717-717w, are set forth in Appendix B.

STATEMENT OF THE CASE

The opinions and orders of the Federal Power Commission (Commission) remanded by the court below establish just and reasonable rates for jurisdictional gas sold in a specific geographic area—the Permian Basin of west Texas and southeastern New Mexico. Opinion Nos. 468 and 468-A represent the first attempt by the Commission to regulate the rates of independent producers on an area basis. Area rate making under the Natural Gas Act is the product of a long administrative and legal struggle to find a workable and effective approach to producer regulation.

A. Historical Background

On June 7, 1954, this Court, in *Phillips Petroleum Company v. Wisconsin*, 347 U.S. 672 (1954), decided that independent producers are natural gas companies within the meaning of the Natural Gas Act. Sales by producers for resale in interstate commerce are therefore subject to the regulatory jurisdiction of the Commission.

In response to its newly found obligation to regulate the rates of independent producers, the Commission went forward under Section 5(a) of the Act with an investigation of the rates and charges of Phillips Petroleum Company (Phillips). On September 28, 1960, the Commission issued

Opinion No. 338[7] terminating both the rate investigation and the consolidated Section 4(e) rate increase proceedings.[8]

The Commission rejected individual company cost-of-service rate making as a basis for fixing Phillips' future rates under Section 5(a), and announced that it would attempt to regulate producers through the development of area rates. At the same time the Commission issued its Statement of General Policy No. 61-1.[9] The purpose of the policy statement was to announce price levels for the various gas producing areas of the nation which would provide guidance to the Commission in certificating initial sales of gas and in suspending rate increase applications. The policy statement guideline price levels have served as an interim form of producer regulation pending the issuance of the Commission's first area rate decision.

Petitioners, the People of the State of California and the Public Utilities Commission of the State of California (California), the states of New York and Wisconsin, as well as several eastern gas distributing utilities, sought review of Opinion No. 338 in the Court of Appeals for the District of Columbia Circuit. The Court of Appeals denied the petitions for review, affirming Opinion No. 338.[10] On May 20, 1963, this Court affirmed the judgment of the Court of Appeals. *Wisconsin v. Federal Power Commission,* 373 U. S. 294 (1963). This Court held that individual company cost-of-service rate making was not the sole method of

---

7. *Phillips Petroleum Company,* Docket Nos. G-1148, *et al.,* 24 FPC 537 (1960).

8. Two of the Section 4(e) dockets were left open, pending determination of issues involving contractual support for the rate increases in question.

9. 24 FPC 818 (1960), 18 C.F.R. 2.56, as amended.

10. *Wisconsin v. Federal Power Commission,* 303 F. 2d 380 (D.C. Cir. 1961).

natural gas rate regulation, and although the question of the legality of area rate making was not before the Court for decision, the Commission was not prohibited from commencing the use of this method.

B. The Proceeding Before the Commission

The Commission selected the Permian Basin as the first area with respect to which just and reasonable producer rates would be determined by use of the area rate making technique. On December 23, 1960, the Commission instituted a Section 5(a) investigation of the rates of producers relating to jurisdictional sales of natural gas produced in the Basin. Existing Section 4(e) rate increase proceedings and several Section 7 certificate proceedings involving gas produced in the Basin were consolidated with the investigation. Thus the Commission would be in a position to determine just and reasonable area rates for the future and to apply such area rates (1) in determining whether suspended increased rates, collected subject to refund, should be allowed or refunded in whole or in part, and (2) in determining the price at which an initial sale should be certificated in terms of the public convenience and necessity.

The proceeding commenced on October 11, 1961, and ultimately involved 251 days of hearing, a transcript containing 30,369 pages, and some 337 exhibits. On September 12, 1963, the hearings were concluded. Briefs were filed by the parties, and the matter was submitted to the Examiner for an initial decision.

1. THE PRESIDING EXAMINER'S INITIAL DECISION

The initial decision was issued on September 17, 1964.

The Examiner determined area ceiling rates for various types of gas within two major categories—new and old

gas. The fixing of prices for new and old gas has come to be known as the two-price system.

The Examiner found that producers could direct, to some extent, their exploration activities in a search for either gas or oil. This meant that a price for new gas-well gas could serve the economic function of eliciting supplies of gas, because the price of oil would play no part in motivating the separately determined search for gas reservoirs.[11] In accordance with this economic approach, the price for new gas-well gas would be based on higher current costs—as opposed to lower historical costs. Thus the rate fixed for new gas-well gas would be higher than the rate fixed for old gas-well gas. This higher rate could therefore serve as an incentive to producers to explore for gas reservoirs and to dedicate new supplies of gas to the interstate market.

The Examiner selected December 23, 1960,[12] as the date dividing new and old gas.

The core of the initial decision was the Examiner's determination of an area ceiling price for new gas-well gas. The estimated national current cost of finding and producing new gas-well gas, including return at 12 percent, was related to the Permian Basin area by the application of a value-based geographical discount. This resulted in an average area price. A "gold standard" allowance was added to the average price to obtain the area ceiling price.

---

11. Gas-well gas is gas produced from gas only and gas condensate reservoirs. It is gas not found in association with crude oil. Gas-well gas is to be distinguished from casinghead gas, or oil well gas. Casinghead gas is produced in conjunction with oil from crude oil reservoirs. Either casinghead gas or gas-well gas from gas condensate reservoirs may be sent through a gasoline plant where liquid hydrocarbons are extracted and later sold. The gas emanating from the tailgate of the plant is known as residue gas.

12. This was the date on which the proceedings were instituted.

"The gold standard is the premium above the average price for superior quality and value." (J.A. 246d.)

The area ceiling price for new gas-well gas governed the area ceiling price for new residue gas, i.e., residue gas derived from new gas-well gas. Separate rates were also determined for new casinghead gas.

The area ceiling price for old gas-well gas was determined by "deflating" the cost based revenue standard for new gas-well gas. The area ceiling prices for old residue and old casinghead gas were, in turn, related to the old gas-well gas price in terms of relative value.[13]

It should be noted that, although determining area ceiling rates by inclusion of a gold standard for superior quality and value, the Examiner nevertheless failed to provide for deductions from the ceiling price, where gas was of less than pipeline quality.[14]

2. THE COMMISSION'S DECISION

Many parties having filed exceptions to the initial decision, the Commission heard oral argument on February 8, 9,

---

13. The area ceiling prices determined by the Presiding Examiner were:

	New (Cents per Mcf.)	Old (Cents per Mcf.)
Gas-well gas	16.75	13.5
Residue gas	16.75	13.5
Casinghead gas	11.00	10.0

14. The foregoing description of the Examiner's initial decision has been confined to a brief review of the derivation of the area ceiling rates. The Examiner also determined minimum rates for gas-well gas and residue gas (9 cents per Mcf) and for casinghead gas (7 cents per Mcf). The decision covered other subjects, such as exemption from regulation for small producers, prohibition of certain price escalation clauses in producer contracts, computation of refunds on an area basis, and provision for special relief for individual producers where imposition of the group rates would lead to serious injustice.

and 10, 1965. Its decision, Opinion No. 468, was issued on August 5, 1965.

The Commission adopted the two-price system and determined base area ceiling rates for new gas-well gas and old (flowing) gas.[15] The Commission selected January 1, 1961, as the date dividing new and flowing gas. Separate prices were not established for types of gas, i.e., gas-well gas, residue gas, and casinghead gas.

In determining the base area rate for new gas-well gas, the Commission utilized the estimated national current cost of finding and producing new gas-well gas, including return computed at a rate of 12 percent. The Commission rejected the use of a geographical discount and a gold standard premium.

In determining the base area ceiling price for flowing gas, the Commission relied upon the 1960 area historical cost of service, including a return of 12 percent, applicable to flowing gas-well gas. This cost was used as a yardstick for the pricing of flowing residue and all casinghead gas.

The base area ceiling rates were to apply to sales of pipeline quality gas. Downward adjustments from the base area rates were to be made for deviations from the pipeline quality standards defined by the Commission for hydrogen

---

15. These Permian Basin base area rates are:

Texas, Including Production Taxes	
New Gas-Well Gas*	16.5 cents per Mcf.
Flowing Gas	14.5 cents per Mcf.
New Mexico, Production Taxes To Be Added	
New Gas-Well Gas*	15.5 cents per Mcf.
Flowing Gas	13.5 cents per Mcf.

*The ceiling price for new gas-well gas is applicable to residue gas derived from new gas-well gas.

Flowing gas includes all gas except new gas-well gas and residue gas derived therefrom.

sulphide, sulphur, carbon dioxide, water, and delivery pressure. Both a downward and an upward adjustment were prescribed to reflect quality differentials respecting Btu content. The Btu adjustment, either upward or downward, would apply only to the base area rates for new gas-well gas and residue gas derived therefrom. The rate resulting from the application of the quality adjustments became the applicable area rate for the particular sale in question.

A minimum base area rate of 9 cents per Mcf for all gas subject to quality adjustments was prescribed.

Special treatment was provided for small producers, whom the Commission defined as producers with sales of less than 10 million Mcf of jurisdictional gas per year. They may receive small producer certificates which authorize all future small producer sales in the area at or below the applicable area ceiling rate. They will not have to obtain separate certificates for each sale, or file the normal annual reports required from large producers.

Provision was made by the Commission for an individual producer to obtain special relief from the imposition of the area rates where such a producer could make a proper showing justifying such treatment, but the Commission made clear that it would not allow this provision to become an escape clause to return to individual company rate making.

The Commission ordered a moratorium on the filing of rate increases above the applicable area rate until January 1, 1968.

With respect to Section 4(e) dockets consolidated in the proceedings, the Commission provided for refunds of increased rates collected subject to refund prior to September 1, 1965, in excess of the applicable area rates. Payment of these Section 4(e) refunds was stayed by the Commission pending judicial review of its decision (J.A. 696d, 1123d).

3. APPLICATIONS FOR REHEARING

Numerous applications for rehearing were filed by the producers. Rehearing was also sought by California (J.A. 1002d-1026d). On October 4, 1965, the Commission issued Opinion No. 468-A, denying all applications for rehearing. However, in response to objections made by producers, the Commission modified the quality standards prescribed in Opinion No. 468 by reducing the delivery pressure standard, and by applying the downward and upward Btu adjustments to flowing gas. It also dealt with the producers' contentions that jurisdictional revenues must equal jurisdictional costs.

C. The Proceeding in the Court Below

Pursuant to Section 19(b) of the Natural Gas Act, the producers, related producer associations, and the states of New Mexico and Texas, respondents herein, filed in the Court of Appeals for the Tenth Circuit petitions to review Commission Opinions Nos. 468 and 468-A.

California intervened in these review proceedings and took the position that the Commission's decision should be affirmed as a lawful exercise of the Commission's authority under Sections 4 and 5 of the Natural Gas Act to fix just and reasonable rates.

On January 20, 1966, the court below stayed Opinions Nos. 468 and 468-A, with certain exceptions, until thirty days after its decision on the merits or until thirty days after the determination of any petition for rehearing.[16] On

16. The court below did not stay the provisions of the Commission's decision which require filing of rate reduction supplements, quality statements, and refund reports, but these filings are not to become operative until termination of the stay order. It also ordered the producers to set aside for possible refund all amounts collected subsequent to September 1, 1965, in excess of the rates determined to be just and reasonable.

January 20, 1967 it rendered its decision remanding the proceedings to the Commission for further hearings. On February 1, 1967 the Commission moved for a stay of mandate and suggested the extension of the stay order. The court below, on February 15, 1967, extended its stay order until thirty days after termination of the proceedings in this Court in the event that petitions for writ of certiorari are filed.[17]

The Court of Appeals affirmed the Commission's authority to adopt the area rate method of regulation. Furthermore, it unequivocally rejected the producers' contention that effective competition exists in the natural gas production industry. Instead, it concluded that the Natural Gas Act's standard of just and reasonable rates and *Federal Power Commission v. Hope Natural Gas Company*, 320 U.S. 591 (1944),[18] required consideration of costs and revenues and rejection of the producers' contract-based commodity value approach. However, the court concluded that the Commission failed to comply fully with the legal requirements for rate making under the Natural Gas Act as determined in the *Hope* case and in *Wisconsin v. Federal Power Commission*, 373 U.S. 294 (1963).[19] It also concluded that certain other provisions in the Commission's opinions and orders were vague.

With regard to the question of compliance with the *Hope* and *Second Phillips* cases, the court below held that the Commission had "rejected the end result test and adopted a fair relationship standard." (App. A, p. 411.) It

17. The court did not rule on the Commission's motion to stay mandate due to the pending petitions for rehearing. (Rule 31b, U.S. Court of Appeals for the Tenth Circuit.)

18. Hereinafter referred to as *Hope*.

19. Hereinafter referred to as *Second Phillips*.

could not ascertain from the Commission's decision the producers' revenue requirements, or the economic factors which permit departure from consideration of costs and revenues, and therefore it could not accept the Commission's determination that a "fair relationship" between costs and revenues was sufficient to comply with the "end result" test. It took the position that under the end result test costs and revenues must balance:

> "Nothing in Second Phillips rejects the end result test of Hope. We believe that it applies here and that it is not satisfied by a finding of fair relationship . . .
>
> From the standpoint of the producer the situation is different. It is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. These requirements must be tested against the record. They may not be brushed aside with a general finding of fair relationship. The Commission concedes that it did not equate jurisdictional costs to jurisdictional revenues. This is obvious because no determination was made of the jurisdictional revenues which the rates will produce." (App. A, pp. 412-13.)

The court ordered that the Commission hold further hearings "to determine group revenues and group revenue requirements," and to make detailed findings to sustain the conclusion of fair relationship. (App. A, pp. 413, 431.)

The court disapproved of the manner in which the Commission treated the problem of price deductions for poor quality gas. The Commission decided that the possibility of finding poor quality gas constituted a risk to the producers and that it should be included in the rate-of-return allowance. The court rejected this position, and held that price deductions to reflect quality deviations are an item

of cost and should be quantified and included "in the applicable base rates instead of hidden in a rate of return allowance." (App. A, p. 423.) Only then, the court held, could it review the adequacy of the rate-of-return allowance.

The court found that the Commission's special relief provision was "insufficient and unsatisfactory." (App. A, p. 430.) This provision indicated that relief would be available for high cost producers who are unable to recover their costs under the applicable area rates. The court agreed with the producers that this relief provision was "so vague and nebulous that neither they nor a court can determine what relief is being granted." (App. A, p. 418.) It directed the Commission to establish relief provisions which "contain guidelines which if followed by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided." (App. A, p. 419.)

With regard to the quality standard for heating value, the court did not understand why the Commission decided to have the downward adjustment begin at 1,000 Btu and the upward adjustment begin at 1,050 Btu. The court directed that the Commission clarify its reasons for this 50 Btu gap between upward and downward adjustments in price. As for the other quality standards the Commission established, the court did not expressly approve or disapprove them. However, it did refuse to resolve the producers' argument that the imposition of them violated procedural due process because of lack of notice, saying: "We are remanding the case and now everyone has notice." (App. A, pp. 421.)

REASONS FOR GRANTING THE WRIT

The serious regulatory problems created by the decision of the court below require resolution by this Court, which charged the Commission almost thirteen years ago with the duty to regulate natural gas producers. Now this Court should decide whether the Commission's first area rate decision is valid and lawful.

An answer to this question by this Court is of fundamental importance to all parties involved in the long struggle to establish regulation of this industry. To date, no effective method of just and reasonable price regulation of this industry has been enforced. Price uncertainty continues to be the reality—producers do not know what price to which they are entitled, and consumers do not know whether the price they are paying is lawful. Millions of dollars of potential refunds have accumulated and continue to grow. The time and effort invested in this first area rate proceeding are very great—over six years, including 251 days of hearings and 30,369 pages of transcript. Three other area rate proceedings have been completed through the hearing stage.[20] They substantially followed the framework created by the Commission's decision in the proceedings presented here for review. Together with the Permian decision, they will achieve regulation for approximately 70 percent of the interstate sales of natural gas. If the decision of the court below remanding the Commission's decision is correct, then not only the Permian proceeding, but all three other area rate proceedings must be reopened, and the achievement of effective regulation of natural gas producers will be delayed again.

---

20. Area Rate Proceeding (Southern Louisiana Area), Docket No. AR61-2; Area Rate Proceeding (Hugoton-Anadarko and Texas Gulf Coast Areas), Docket Nos. AR64-1 and 2.

The decision of the court below constitutes a major judicial precedent under the Natural Gas Act. Unfortunately, it is obscure and contradictory. The court below misconstrued the requirements for rate making as laid down in the *Hope* case and the suggestions relating to area rate making which were made in the *Second Phillips* case. With regard to the question of jurisdictional revenues balancing jurisdictional costs, it seems to require disregard of the principles established by *Federal Power Commission v. Sierra Pacific Power Company*, 350 U.S. 348 (1956).[21] It has departed from the primary principle of the *Hope* case that "it is the result reached, not the method employed, which is controlling" by directing the Commission to treat quality deviations as an item of cost and not as a risk. Finally, the court below has failed to make known to the Commission what it must do in order to correct its decision with regard to the "Btu gap" and the special relief provision. For these reasons, the case fully deserves review here.

1. Due to the National Importance of Effective Producer Regulation, Consumers Need a Decision by This Court on the Validity of Area Rate Making.

The result of the decision by the court below is to overthrow the Commission's time-consuming attempt to establish effective regulation of natural gas producers on an area basis. This result can have only dire consequences for consumers who have been waiting almost thirteen years for effective producer regulation. Rate increase has piled upon rate increase without any final determination of just and reasonable rates. California asks whether or not interminable administrative proceedings—apparently seeking an ideal and perfect method of doing things and always at

21. Hereinafter referred to as *Sierra Pacific*.

great length and consuming long periods of time—are not presently or, at least, will not soon be tantamount to failure to regulate.

The court below makes little or no mention of the primary purpose of the Natural Gas Act, which this Court has said is "to protect consumers against exploitation at the hands of natural gas companies." *Federal Power Commission v. Hope Natural Gas Company*, 320 U.S. 591, 611 (1944); *Phillips Petroleum Company v. Wisconsin*, 347 U.S. 672, 685 (1954). This purpose was reaffirmed in *Sunray Midcontinent Oil Company v. Federal Power Commission*, 364 U.S. 137, 147 (1960), and rephrased in *Atlantic Refining Company v. Public Service Commission of the State of New York*, 360 U.S. 378, 388 (1959): "The Act was so framed as to afford consumers a complete, permanent and effective bond of protection from excessive rates and charges." The direct effect of the lower court's decision will be several more years of delay in achieving effective regulation. It is even possible that upon reopening these proceedings, the Commission and consumers will hear the argument that the 1960 test year has become "too stale" and that a more recent one is required. In this way the producers may yet avoid completely any realistic regulation, and thereby achieve the relief Congress has denied them.

California's need for effective producer regulation is unusually great. California is the largest state in the Union, having a current population in excess of 19,000,000. The State depends on natural gas as the basic source of residential and industrial energy. Not only is gas used directly for space heating, water heating, air conditioning, and cooking, but it provides in large measure the energy used for generating electricity. Unlike other areas of the nation, coal is not an economical alternative to natural gas for meeting

California's energy requirements for space and water heating.

California intervened in the proceedings before the Commission and in the review proceedings in the court below because most of the gas produced in the Permian Basin is consumed in California.[22] The State consumes approximately 11.1 percent of all the gas produced in the United States. Almost 75 percent of the supply of natural gas needed to meet the demands of the California market is furnished from sources beyond the borders of the State, while the remainder is drawn from wells within California. Of the out-of-state supply, 87 percent is transported to California by El Paso Natural Gas Company and Transwestern Pipeline Company from sources in Texas, New Mexico, Oklahoma, and Arizona; and 13 percent is imported from Canada and transported to California by Pacific Gas Transmission Company. Residents of California must ultimately pay the rates determined by the Commission in the orders reviewed by the court below. These orders result in rate reductions and substantial refunds which will benefit ultimate consumers in California.

The delay resulting from the lower court's decision will adversely affect the possibility of any refunds to consumers. As this Court has noted, future refunds cannot and do not fully protect the ultimate consumer of natural gas. In evaluating the effectiveness of future refunds as protection for natural gas consumers, the Supreme Court in *Federal Power Commission v. Tennessee Gas Transmission Company*, 371 U.S. 145, 154 (1962), stated:

> "True, the exaction would have been subject to refund but experience has shown this to be somewhat illusory

22. In 1964 alone, slightly less than 70 percent of the Basin's production dedicated to interstate sales was delivered to the California market.

> in view of the trickling down process necessary to be followed, the incidental cost of which is often borne by the consumer, and in view of the transient nature of our society which often prevents refunds from reaching those to whom they are due."[9] [Footnote omitted.]

Consumers of natural gas have waited almost five years for the relief provided them by the Commission in Opinion Nos. 468 and 468-A. The remand order of the court below, when combined with the risk of a possible second review proceeding, means an unspecified delay, perhaps into the 1970's. Even now the total amount of refunds due consumers is estimated to be nearly forty million dollars ($40,000,000). If another three or four-year delay occurs, this amount will be so great that consumers will be told that refunds are not possible because the producing industry will suffer irreparable damage.

Time is critical in this proceeding. Consumers, producers, and the Commission need a decision by this Court reviewing the first area rate decision. California maintains that the remand order of the court below is erroneous and obscure, and that it is unclear what the Commission must now do. The risk of a second review proceeding and another remand to the Commission is too great, and the questions of public policy are too important not to have a decision by this Court.

2. The Court Below Has Misconstrued This Court's Decisions in the Hope and Sierra Pacific Cases With Regard to Rate Making Under the Natural Gas Act

a. The Hope End Result Test Does Not Require That Area Revenues Equal the Allowable Area Cost of Service

The critical issue in this case is whether the Commission has complied with the legal requirements for rate making under the Natural Gas Act. The court below concluded that

the Commission failed to do so. Although the court recognized that "the Commission is not bound by any formula or method" in rate making under the Natural Gas Act, it concluded that the controlling standard for area rate making is the end result test set down in the *Hope* case. (App. A, pp. 400, 403, 412.) It rejected the Commission's determination that the end result test was satisfied by its finding that the rate order, when viewed in its entirety, established a fair relationship between the area rates prescribed by the Commission and the allowable cost of service for the area. The Commission's method involved consideration of composite cost data as a basic ingredient in area rate making, as well as other economic and policy factors, but it did not involve a specific finding that group revenues would balance group costs.[23] The lower court concluded that the Commission must, under the end result test, balance these costs and revenues. (App. A, pp. 411, 413.)

The position taken by the court below fully adopts the producers' contention that once composite cost-of-service data are utilized in area rate making, the Commission must proceed as it would in an individual utility company cost-of-service proceeding. (App. A, p. 428-29.) This position is erroneous because it interprets the *Hope* end result test to be extremely rigid and narrow, thereby denying any flexibility to the Commission at all, and it grossly misunderstands the area rate concept by viewing it as no different from individual company cost-of-service rate making. The end result

---

23. It should be recognized that "group costs" as used herein refer to the Commission's cost-of-service determinations for new and old gas-well gas. These cost-of-service determinations were used as yardsticks for the pricing of other types of gas. They include allowances for exploration, which may or may not be expended for this purpose. Certainly the term "costs" does not refer to costs which must be recovered in order to avoid confiscation and consequent denial of due process.

test does not require that group revenues balance group costs; nowhere in the *Hope* case has this Court said that this test can be satisfied only by computing this particular equation. On the contrary, *Hope* affirmatively states that no single formula is required to be used in rate making under the Act. 320 U.S. 591, 602.

The essence of the end result test is whether the Commission's order *"viewed in its entirety"* meets the requirements of the Natural Gas Act. While the court below relied on *Second Phillips* for applying the end result test to area rate making, it failed to follow this Court's explicit description in that decision of what this test involves:

> "But to declare that a particular method of rate regulation is so sanctified as to make it highly unlikely that any other method could be sustained would be wholly out of keeping with this Court's consistent and clearly articulated approach to the question of the Commission's power to regulate rates. It has repeatedly been stated that no single method must be followed by the Commission in considering the justness and reasonableness of rates, *Federal Power Comm'n v. Natural Gas Pipeline Co.*, 315 U.S. 575; *Federal Power Comm'n v. Hope Natural Gas Co.*, 320 U.S. 591; *Colorado Interstate Gas Co. v. Federal Power Comm'n*, 324 U.S. 581, and we reaffirm that principle today. As the Court said in *Hope*:
>
> > 'We held in *Federal Power Commission v. Natural Gas Pipeline Co., supra,* that the Commission was not bound to the use of any single formula or combination of formulae in determining rates. Its rate-making function, moreover, involves the making of 'pragmatic adjustments.' *Id.*, p. 586. *And when the Commission's order is challenged in the courts, the question is whether that order 'viewed in its entirety' meets the requirements of the Act. Id., p. 586. Under the statutory standard of 'just and reasonable' it is the result reached not the*

method employed which is controlling.' 320 U.S., at 602.

More specifically, the Court has never held that the individual company cost-of-service method is a *sine qua non* of natural gas rate regulation. Indeed the prudent investment, original cost, rate base method which we are now told is lawful, established, and effective is the very one the Court was asked to declare impermissible in the *Hope* case, less than 20 years ago." (373 U.S. 309; emphasis added.)

This passage clearly demonstrates that the Commission does not have to use one particular formula or equation, and that the end result test is made by viewing the Commission's order in its entirety to see if it is just and reasonable as required by the Act. The lower court has misunderstood the *Hope* case by transforming the flexible end result test into a rigid and narrow method consisting of no more than the revenues-must-equal-costs equation. It says, in effect, that only this equation satisfies the end result test, and this equation must show revenues equal costs or the rate order falls. This view is in direct conflict with *Hope* and the passage above from *Second Phillips* and the other cases cited therein.

Moreover, this rigid interpretation of the end result test is contradictory not only to the Commission's concept of area rate making but also to this Court's preliminary view of it in *Second Phillips*. In that case this Court stated that area rate making involves consideration of economic factors of the industry and not merely strict adherence to the revenue-cost equation. This Court quoted the statement by the Commission in Opinion No. 338 that it intended to set rates "based on 'the reasonable financial requirements of the industry' in each production area." (373 U.S. 294, 310.) This statement demonstrates that this Court under-

stood and approved of the Commission's intention to consider economic factors other than costs.[24]

Nevertheless, the court below emphasized that it rejected the Commission's "fair relationship" interpretation of the end result test because it was not told what economic factors "either require or permit departure from costs and revenues." (App. A, p. 429.) In taking this position, the lower court does not evaluate or even mention the various factors which the Commission said it did consider, such as: (1) that area rate making differs from individual company cost-of-service rate making in that it does not involve the costing of all gas, but instead, the costing of old gas-well gas as the yardstick to set the price for oil-well gas on a commodity value basis because this gas is a by-product of oil production and, as a result, its cost could not be accurately determined. (J.A. 574d, 614d-624d);[25] (2) that some 9.0 cents of the 14.5 cents price for flowing gas was partly based on non-cost factors with the purpose of meeting the producers' "revenue deficiency" argument (J.A. 1112d-1114d); (3) that the producers would receive additional revenues than merely those permitted by the Commission's rates because of certain contract provisions and because of the extraction of liquid hydrocarbons (J.A. 1112d-1115d); (4) that the Commission substantially reduced the amount of the downward price adjustments due to quality deviations (J.A. 1115d-

24. See also footnote 16, 373 U.S. 294, 310, where this Court announced that it did not interpret the decision of the Court of Appeals for the District of Columbia in *City of Detroit v. Federal Power Commission*, 230 F. 2d 810 (D.C. Cir. 1955), "to suggest that, in the view of that court, individual company cost of service is the method required to be used in independent natural gas producer rate regulation."

25. While the cost of oil-well gas could not be determined precisely, the Commission specifically found that its cost was substantially below the cost of old gas-well gas (J.A. 1112d).

1116d); and (5) that the Commission took into account that its rates should avoid abrupt departures from existing pricing patterns in order to avoid business dislocations (J.A. 573d-574d). At the very least, the court below should have given consideration to these factors in evaluating the Commission's decision. The lower court having failed to do so, the Commission is the victim of obscurity in that it has not been told why these factors are not sufficient to justify its finding of a fair relationship between revenues and costs.

Finally, the court below has refused to give the Commission any deference for its judgment and discretion as a federal administrative agency in possession of expertise in the matters under its jurisdiction. *Securities and Exchange Commission v. Chenery Corporation,* 332 U.S. 194, 207-8 (1947). It is clear that where rate making is involved some findings of regulatory bodies are proper without detailed explanations or even any supporting evidence. *Market Street Railway Company v. Railroad Commission,* 324 U.S. 548 (1945); 2 Davis, Administrative Law, 471-2 (1958). But the lower court has rejected, without any discussion, the various economic factors relied upon by the Commission in determining area rates.

b. The Rigid Interpretation by the Court Below Contradicts This Court's Holding in the Sierra Pacific Case

In requiring that group revenues balance group costs, the court below has disregarded this Court's decision in *Federal Power Commission v. Sierra Pacific Power Company,* 350 U.S. 348 (1956), which held that voluntarily made rates which are below the just and reasonable rate cannot be raised merely because they are unprofitable. A natural gas company may agree by contract to a rate affording less than a fair return, and, if it does so, it is not entitled

to relief by the Commission for its improvident bargain unless such relief is required by the public interest.[26] But the court below seems to suggest that the minimum rate be raised in order to make group revenues equate to group costs. Any such action would be directly contrary to the *Sierra Pacific* decision.

Unfortunately, the opinion of the court below is ambiguous on this point. While noting that "the producers are not entitled as a matter of right to collect contract rates that are higher than otherwise reasonable in order to offset other rates limited by contract to below maximum reasonable levels" and that "contract limitations are one of the facts of life for the natural-gas industry" (App. A, pp. 424), it expressed concern over the revenue deficiency resulting from these contract limitations, and it noted that in group procedures before the Interstate Commerce Commission "revenue from one source may balance that from another" (App. A, pp. 423-24). The lower court's discussion of this matter ends with the statement that "the controlling question is whether the proper revenue requirements of the area producers as a group can be satisfied with rates having the ceiling and the floor which the Commission has fixed" (App. A, p. 425). This language suggests that the minimum rate would be rejected or raised if the court concluded that the "proper revenue requirements" were not "satisfied." Significantly, the lower court concluded that it cannot answer this question because the revenue-cost equation has not been provided.

Whatever the lower court's opinion may mean with regard to this matter, there can be no doubt of the unlaw-

---

26. 350 U.S. 348, 355. The Commission partly justified its minimum rate order as being in the public interest because its effect on consumers would be *de minimis*. No such finding is possible if the minimum rate is raised to produce 10 million dollars in order to balance the lower court's revenue-cost equation.

fulness of raising the minimum rate to or near the just and reasonable rate in order to balance group revenues and group costs. This view is contrary not only to the *Sierra Pacific* case, but also to *Federal Power Commission v. Tennessee Gas Transmission Company,* 371 U.S. 145 (1962), which held that losses in one zone of operations do not justify an illegal gain in another zone. If the court below is correct in viewing area rate making as only another instance of individual company cost-of-service rate making, then certainly it cannot ignore the *Sierra Pacific* and *Tennessee* cases by relieving the producers from their voluntarily made low contract rates.

3. It Is for the Commission to Determine the Proper Regulatory Method to Provide for the Impact of the Quality Deductions

The court below has rejected the Commission's method of providing for the impact of the quality adjustments by permitting a more than adequate rate of return. Contrary to the *Hope* case, the court has determined what method the Commission should use. The court has ordered the Commission to treat price deductions for deviations from pipeline quality gas as "an item of cost rather than an item of risk" which "should be directly reflected in the applicable base rates instead of hidden in a rate of return allowance" (App. A, p. 422-23).

By directing the Commission how to treat the impact of quality deviations, the lower court has again misconstrued the *Hope* case. Despite the fact that under *Hope* it is the end result, not the method used, which is the standard for judicial review of the Commission's rate orders, the court has disagreed with the Commission's views on the regulatory method to be followed and substituted its own theory and method. The Commission, as well as the Examiner in his initial decision, explained the compelling necessity for quality standards (J.A. 245d-246d;

645d-647d). Certainly the Commission has the expertise and discretion to view the quality problem as a risk. There can be no doubt that in exploring for natural gas there are at least two possibilities: (1) that no gas will be found, and (2) that the gas which is found may be poor in quality. Both these possibilities are unknown until drilling is completed. By holding that these price deductions for quality deviations be treated as an item of the cost of production, the court ignores the fact that there was no showing that low quality gas costs any more to produce than gas of pipeline quality, and the fact that the essential processing costs to bring it up to pipeline quality are borne by the pipeline purchasers. As the body possessing expertise in regulating this industry, the Commission is well within its legal powers to view this problem in the manner it deems best.

Moreover, the court refused to consider the question whether the 12 percent rate of return is adequate because, under the Commission's approach, it cannot "determine the amount of return with any degree of certainty." (App. A, p. 422.) The court justifies this refusal on the ground that the record failed to disclose the amount of the quality deductions, and therefore it was "impossible to determine whether the rate of return satisfies the *Bluefield* and *Hope* principles . . ."[27] (App. A, p. 423). In Opinion No. 468-A the Commission expressly found that while the record did not permit *exact* quantification of the impact of the quality deductions, there was adequate record support for the conclusion that the quality impact would be in the range of .7 to 1.5 cents per Mcf, reduced by additional revenue for plant liquids and the effect of the Btu adjustments (J.A. 1115d). Instead, the lower court erroneously stated

27. *Bluefield Water Works and Improvement Company v. Public Service Commission*, 262 U.S. 679 (1923).

that the only estimates of quality impact were based on the quality statements filed with the Commission pursuant to Opinion No. 468.[28] Since the quality impact was known and since the Commission found it to be reasonable, the court should have resolved the question of the adequacy of the rate of return which was deliberately made generous on this account.

4. The Remand Order of the Court Below Is Vague With Regard to the Special Relief and Quality Provisions

The decision of the court below is particularly obscure regarding the Commission's special relief provision and its quality standards in that it has left unclear what precisely the Commission must do upon remand.

Concerning the special relief provision, the court below seems to conclude that the Commission intended to grant relief only from confiscation. (App. A, p. 419.) Such a conclusion is clearly erroneous. The Commission did not limit the basis for invoking the special relief procedure to claims of confiscation; it specifically stated that "there may be other circumstances where a producer as a matter of law or in the public interest would be entitled to some relief" (J.A. 658d). Obviously when the Commission has only begun the task of establishing a new concept such as area rate making, it cannot now foresee all possible relief situations.

The relief provision was designed to provide notice that relief would be available. For practical reasons, the Commission did not attempt to foresee all the possible factual situations justifying special relief, nor did it spell out in detail what the relief would be. These specifics obviously

---

28. The court is inconsistent here. It did rely on the Commission's estimate in order to justify its decision that quality deductions should be treated as a cost item, but it did not use the estimate in considering the adequacy of the rate of return, saying that the record failed to disclose the amount of the deductions. (App. A, pp. 423, 422.)

could be provided when the time for such relief arose. The court below, however, characterized this provision as "inadequate" and said that an adequate relief provision would "contain guidelines which if followed by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided." (App. A, p. 419.) In addition, the lower court seems to say that individual costs should be the basis for relief. (App. A, p. 419.) This position would mean a return to individual cost of service.

In directing that each producer be entitled to a stay from the Commission's rate order, the lower court provides the means to undermine area rate making through numerous stays pending relief. The Commission could be deluged with hundreds of petitions for relief. No such right to a stay was required by this Court in the *New England Divisions* case, 261 U.S. 184 (1923), in which the Interstate Commerce Commission's rate order became effective immediately, subject to later adjustment if a proper showing was made. As in that case, there is no reason for an automatic stay from area rates; the general rule should prevail that stays will be granted only upon a showing of irreparable injury to the producer concerned. The mere possibility that a producer is entitled to special relief from area rates does not justify the continuance of collecting rates which have been held to be too high. *Federal Power Commission v. Tennessee Gas Transmission Company*, 371 U.S. 145, 151-2, 154 (1962); *United Gas Improvement Company v. Callery Properties, Inc.*, 382 U.S. 223 (1965).

With regard to quality standards, the lower court is even more obscure. It specifically required explanation why the Commission provided the "Btu gap" in its quality standard for Btu content. (App. A, p. 421.) But it failed to approve or disapprove the other quality standards. It merely com-

mented that it would not resolve *at this time* the producers' contention that procedural due process was violated because of lack of notice on the matter of quality standards. Such language leaves the Commission in a quandary. Is it supposed to reopen all the quality standards for further hearings and redetermination, or should it just explain at greater length its reasons for the Btu gap. If it fails to reopen all the quality standards for further hearings, the Commission risks a second remand on the notice question. The effect of the lower court's decision is to reverse the Commission on all its quality standards without giving any reasons.

CONCLUSION

Petitioners respectfully request the opportunity to present these questions to the Court more fully. They are important questions of public law. They are questions affecting millions of citizens and involving millions of dollars. Their resolution will have far-reaching effect.

Petitioners respectfully submit that this petition for a writ of certiorari to the United States Court of Appeals for the Tenth Circuit should be granted.

Respectfully submitted,

OPINION NO. 468

OPINION AND ORDER DETERMINING JUST AND REASONABLE RATES FOR NATURAL GAS PRODUCERS IN THE PERMIAN BASIN

(Issued August 5, 1965)

INTRODUCTION

SWIDLER, Chairman:

This is the first area proceeding to determine just and reasonable rates for natural gas producers. It is the culmination of an effort initiated more than four and a half years ago, and which has been carried forward with the greatest sense of urgency on the part of all concerned. The area is the Permian Basin, one of the nation's great oil and gas provinces, comprising the counties of Chaves, Eddy and Lea, New Mexico, and Texas Railroad Commission Districts No. 7-C and No. 8.

Pursuant to Section 5 of the Natural Gas Act we here establish the future rates for jurisdictional sales of gas by producers in the area.[1] Also consolidated in this area proceeding are a large number of increased rate filings suspended under Section 4 of the Act and a limited number of applications for certificates of public convenience and necessity pursuant to Section 7 which are disposed of in a separate order issued this date.

The Commission initiated the proceeding by order of December 23, 1960 (24 FPC 1121). Prehearing conferences were held in Midland, Texas, beginning March 6, 1961, and in Washington on April 27, 1961. Forty-seven petitions to intervene were granted. The number of parties in the proceeding total 384, including 336 gas producers who are respondents.

---

[1] The respondents are listed in Appendix A to this opinion.

The Commission prescribed questionnaires for the major producer respondents to obtain information with respect to Permian Basin and nationwide cost and operating experience. 26 FPC 247, 514, 531 (1961). A special form was prescribed for the small producers. 27 FPC 20 (1962). (The dividing line between major and small producers was determined by the level of nationwide jurisdictional sales, 10 million Mcf in calendar year 1960). A significant early ruling in this proceeding was the Commission's order of May 14, 1962, holding that individual company cost-of-service evidence would not be received in evidence but that composite cost studies would be admissible. 27 FPC 943 (1962).

The hearings extended over a period of almost two years beginning on October 11, 1961, and closing on September 12, 1963. The examiner rendered his decision on September 17, 1964.

Fourteen individual and joint briefs on exceptions were filed on behalf of 111 respondents and numerous other interested persons, not parties, who joined with them. Most of the producers adopted the briefs on exceptions of Continental Oil Company (Major Producer Group).[2] Separate briefs were filed by the Com-

[2] Respondents filing independent or supplemental briefs on exceptions included Amerada Petroleum Corporation (Amerada); Humble Oil and Refining Company (Humble); Hunt Oil Company, *et al.* (Hunt); Perry R. Bass (Operator), *et al.* (Bass); Phillips Petroleum Company (Phillips); Placid Oil Company (Placid); Standard Oil Company of Texas, a Division of California Oil Company (Standard); Sun Oil Company (Sun); Superior Oil Company (Superior); and Warren Petroleum Corporation (Warren).

mission staff, by the numerous interveners and as *amici curiae* by several groups with a substantial interest in the general problem.[3]

Oral argument lasting three days was held beginning February 8, 1965, and the proceedings are now before us for decision.

SUMMARY OF EXAMINER'S DECISION

We acknowledge at the outset our indebtedness to Examiner Wenner for his penetrating analysis of the basic economics of the industry and his constructive proposals for a pricing system in harmony with the realities of the industry and the Commission's responsibilities under the Natural Gas Act. We must acknowledge also the helpful and constructive role of the parties to the proceeding. The cooperation of the respondents and the interveners with the Commission has been instrumental in achieving what the examiner has described as a breakthrough in reaching a workable method of producer regulation.

[3] Interveners filing briefs on exceptions included Northern Natural Gas Company (Northern); King-Stevenson Oil Company, Inc., *et al.* (Oklahoma Interveners); the State of California and the Public Utilities Commission of California (jointly referred to as Cal-PUC); a group of California distributors (California Distributors); the City and County of San Francisco (San Francisco); the City of San Diego (San Diego); the State of Texas jointly with Texas Independent Producers and Royalty Owners and West Central Texas Oil and Gas Association (Texas-TIPRO-WCTOGA); and the Independent Petroleum Association of America (IPAA). Briefs on exceptions as *amici curiae* were filed by Philadelphia Electric Company (Philadelphia); Associated Gas Distributors (AGD) (a group of approximately seventy major distributors) and the Oklahoma Independent Petroleum Association (OIPA).

The examiner's decision would establish ceiling prices to apply, with certain exceptions, to all the sales being considered in this proceeding. These proposed ceilings were, in the case of rate schedules filed with this Commission on or after December 23, 1960, 16.75 cents per Mfc for gas-well gas, 15 cents per Mcf for residue gas, and 11 cents per Mcf for oil-well gas. In the case of rate schedules filed before December 23, 1960, the proposed ceilings were 13.5 cents per Mcf for gas-well gas and residue gas and 10 cents per Mcf for casinghead gas. The presiding examiner found, however, that the rates of producer-respondents making jurisdictional sales of less than 10,000,000 Mcf annually were just and reasonable and did not apply the proposed ceilings to any such respondents. Operators of processing plants, even if selling less than 10,000,000 Mcf annually, would have their rates limited by the proposed ceilings.

In the case of Section 4(e) proceedings consolidated herein, the examiner would order certain refunds which were to be computed for separate years and categories of gas on the basis of whether the industry had realized more than the proper revenue as well as on the basis of the individual rates collected. Deficiences in one category would be used to offset excessive revenues in

other categories each year. The presiding examiner further stated that since the record does not contain information needed to determine the actual or proper revenue for years other than 1960, for such years the parties

within 90 days of the initial decision should submit draft orders with requests for information and with specific proposals regarding refunds.

The presiding examiner declared most favored-nation clauses and spiral escalation clauses in existing contracts to be inoperative and of no legal effect, and would allow no future change in rate resulting from any such clause to take effect. He fixed a minimum price of 9 cents per Mcf for residue and gas-well gas and 7 cents per Mcf for casinghead gas, and would allow rate increases to these levels to be filed with the consent of the buyer.

THE NATURAL GAS INDUSTRY AND ITS ACTIVITIES IN THE PERMIAN BASIN

The major known deposits of natural gas in the United States are located primarily in the States of Texas, Louisiana, Oklahoma, New Mexico, and Kansas. In addition, there are substantial reserves in the offshore area of Louisiana and Texas. More than 70 percent of all the natural gas produced for marketing in the United States is sold in interstate commerce subject to the jurisdiction of the Commission. The Permian Basin alone accounts for about 11 percent of all the gas moving into the interstate market.

Natural gas and crude oil are both hydrocarbons, and they are often found in common reservoirs. As a result gas and oil production are interrelated. Our responsibility is confined to regulating the sales of natural gas. In his opinion (p. 23) the examiner classified natural gas as "oil well gas" or "gas well gas", depending upon

The examiner's decision would establish ceiling prices to apply, with certain exceptions, to all the sales being considered in this proceeding. These proposed ceilings were, in the case of rate schedules filed with this Commission on or after December 23, 1960, 16.75 cents per Mfc for gas-well gas, 15 cents per Mcf for residue gas, and 11 cents per Mcf for oil-well gas. In the case of rate schedules filed before December 23, 1960, the proposed ceilings were 13.5 cents per Mcf for gas-well gas and residue gas and 10 cents per Mcf for casinghead gas. The presiding examiner found, however, that the rates of producer-respondents making jurisdictional sales of less than 10,000,000 Mcf annually were just and reasonable and did not apply the proposed ceilings to any such respondents. Operators of processing plants, even if selling less than 10,000,000 Mcf annually, would have their rates limited by the proposed ceilings.

In the case of Section 4(e) proceedings consolidated herein, the examiner would order certain refunds which were to be computed for separate years and categories of gas on the basis of whether the industry had realized more than the proper revenue as well as on the basis of the individual rates collected. Deficiences in one category would be used to offset excessive revenues in

other categories each year. The presiding examiner further stated that since the record does not contain information needed to determine the actual or proper revenue for years other than 1960, for such years the parties

within 90 days of the initial decision should submit draft orders with requests for information and with specific proposals regarding refunds.

The presiding examiner declared most favored-nation clauses and spiral escalation clauses in existing contracts to be inoperative and of no legal effect, and would allow no future change in rate resulting from any such clause to take effect. He fixed a minimum price of 9 cents per Mcf for residue and gas-well gas and 7 cents per Mcf for casinghead gas, and would allow rate increases to these levels to be filed with the consent of the buyer.

THE NATURAL GAS INDUSTRY AND ITS ACTIVITIES IN THE PERMIAN BASIN

The major known deposits of natural gas in the United States are located primarily in the States of Texas, Louisiana, Oklahoma, New Mexico, and Kansas. In addition, there are substantial reserves in the offshore area of Louisiana and Texas. More than 70 percent of all the natural gas produced for marketing in the United States is sold in interstate commerce subject to the jurisdiction of the Commission. The Permian Basin alone accounts for about 11 percent of all the gas moving into the interstate market.

Natural gas and crude oil are both hydrocarbons, and they are often found in common reservoirs. As a result gas and oil production are interrelated. Our responsibility is confined to regulating the sales of natural gas. In his opinion (p. 23) the examiner classified natural gas as "oil well gas" or "gas well gas", depending upon

the conditions of production. He used the term "residue gas" to describe oil-well gas or gas-well gas after it has been processed and the liquids removed.

277,571

— 5 —

The natural gas industry is divided into three distinct segments. First there are the producers. Jurisdiction under the Natural Gas Act attaches when the gas is sold for resale in interstate commerce. The intermediate segment of the industry consists of the interstate pipeline companies which transmit the gas from the producing fields through large diameter pipelines as much as a thousand miles or more to centers of distribution throughout the nation. The third segment of the industry comprises the distributors of the gas in thousands of communities throughout the nation who are under state or local regulation exclusively, but who rely on this Commission to regulate the price at which they purchase gas at wholesale from the interstate pipelines. It should be noted that there is some overlapping in these categories. Some pipeline companies produce a share of their own natural gas and sell gas to other pipelines; other engage in distribution operations. Also, some producers perform gathering or transportation services and some distributors engage in production and transmission activities.

The Permian Basin is a major geological formation underlying much of western Texas and southeastern New Mexico. It is rich in oil and gas deposits, and is one of

the major hydrocarbon producing areas in the Western Hemisphere.

About two-thirds of the gas produced in the Permian Basin is oil-well gas, that is, gas produced in conjunction with oil. By contrast, oil-well gas represents only about one-third of the total gas production in the continental United States. Oil-well gas is limited as to the hours of availability in a month since it is governed by the allowable oil production, which is subject to state regulation. The gas must be produced as the oil is produced, and it is not produced at any other time. It is produced on such a basis as will maximize the production of oil, for which it is the lifting agent. In

these respects it contrasts unfavorably with gas-well gas, which while subject to state prorationing authority on a field basis, can be produced on a demand schedule. Oil-well gas is also produced at lower pressures than those common to gas-well gas. Production at less than 50 pounds pressure is not unusual in the case of oil-well gas. Since pipelines require pressures approaching one thousand pounds, low-pressure gas must be compressed before it can be taken into a pipeline stream. Processing of such gas will include one, two, three or more stages of compression.

In the Permian Basin, most oil-well gas is "sour" gas before processing.[4] Some of the gas from the Permian Basin also has an unusually high carbon dioxide content, ranging in some instances as high as 50 percent. Carbon dioxide is non-flammable and is presently useless to the petrochemical industry. When present in significant quantities it must be removed, entailing both processing costs and reduction in the volume of gas which remains for use.

Historically, prices for gas in the Permian Basin have been lower than prices in most other areas. For many years oil-well gas was vented or flared, because there was no market for it. Three interstate pipelines, however, now make substantial purchases of gas in this area, and venting or flaring has been reduced to very low levels. El Paso Natural Gas Company (El Paso) began purchasing Permian Basin gas in 1945 for interstate transmission in connection with construction of the first natural gas pipeline from Texas to California. It was the sole interstate purchaser until 1954. In that year Northern Natural Gas Company (Northern) made its first purchase in the Permian Basin through Permian Basin Pipeline Company. In 1958 Transwestern Pipeline Company (Transwestern) began its purchases in the Permian Basin to supply the second pipeline from that area to California.

---

[4] "Sour" gas is considered to be gas containing 10 or more grains of hydrogen sulphide or 200 or more grains of total sulphur per Mcf. The sulphur content of Permian Basin oil-well gas is generally higher than that of gas from any other area in the United States.

In 1961 El Paso purchased 73 percent of the Permian gas moving in interstate commerce; Northern accounted for 18 percent, and Transwestern for 9 percent. It is estimated that 85 percent of the gas moving in interstate commerce from the Permian Basin goes to California, an area of rapidly expanding demand by both industrial and residential consumers. The gas-producing wells in the Permian Basin, therefore, are some 900 to 1,300 miles from the principal points of use for the gas.

HISTORY OF THE DEVELOPMENT OF THE AREA APPROACH TO PRODUCER REGULATION

The Federal Power Commission's regulation of the rates of electric utilities and natural gas pipeline companies under the Federal Power Act and Natural Gas Act had uniformly been conducted on an individual cost-of-service basis at the time of the Supreme Court's *Phillips* decision on June 7, 1954[5] which held that the Commission had jurisdiction over the regulation of well-head gas prices, a jurisdiction the Commission had theretofore questioned. Faced with the novel problem of regulating thousands of gas producers, the Commission's first guarded attempts at producer regulation were on an individual company basis.[6] A few of the first rate in-

---

[5] *Phillips Petroleum Co.* v. *Wisconsin*, 347 U.S. 672 (1954).

[6] Ross, W. W., "The Area Rate Proceedings," 18 S. W. L. J. 165, 170 (1964); note, "F.P.C. Regulation of Independent Producers of Natural Gas," 75 Harv. L. Rev. 549 (1962).

The fact that the increase in condensate products has outstripped the increase in gas-well gas production reflects the richer content of liquids in the new gas-well gas which is being discovered and the improved separation techniques developed by the industry. The examiner by basing his credit exclusively on the liquid to gas ratio in current production has not taken into account this trend in condensate production. Since we are here concerned with a ceiling price to apply to new gas-well gas, the liquid credit we allow must reflect current and expected experience. We believe that a figure based upon the respondents' responses to the Commission's questionnaire is more nearly representative of current trends. Witness Park determined a gross credit of 3.71 but as was explained with regard to production operating expenses (*supra*, page 54) we agree with the examiner and Witness Roseman that the questionnaire data from which this figure was derived by Witness Park was not fully representative of industrywide production. The questionnaire data reflects a larger production of condensate on a unit basis than do the nationwide statistics. Accordingly, in our judgment, the 3.71 cents per Mcf gross liquid credit should be adjusted downward to reflect this distortion. We believe that taking all facts into consideration the proper gross liquid credit should be 3.50 cents per Mcf. This credit is based upon production which is well within the range of published statistics for 1960 and is in line with the trend in later years toward increased realization of condensate per Mcf of gas.

The gross figure of 3.50 cents after deduction of production taxes and royalties leaves a net liquid credit of 2.90 cents, not including plant liquids, which we here adopt.

In addition to liquids extracted at the well, gas-well gas is also processed at stripping plants. Producers usually share in the revenues from these plant liquids on a percentage basis. Witness Roseman testified that if the producers receive only 20 percent of the liquid revenues it would amount to 0.4 cent per Mcf of gas-well gas produced. The California Distributors and Texaco, who sponsored witness Park, stipulated that for purposes of this case a credit for plant liquids in the range of 0.1 cent to 0.2 cent per Mcf of gas-well gas produced could be used. In light of Witness Roseman's analysis and the trend of richer liquid content which the record reveals we shall adopt the examiner's conclusion that the upper range of the stipulation, 0.2 cent per Mcf, should be accepted as an appropriate plant liquid credit.

The addition of 0.20 cent per Mcf to the 2.90 cents per Mcf net liquid credit gives a total liquid credit of 3.10 cents per Mcf.

REGULATORY EXPENSE

Neither Witness Roseman, for the California Distributors, nor Witness Park, for the Major Producers Group, included in the computation of costs any amount of regu-

latory expense. The presiding examiner, however, included in his computation an item of .14 cent per Mcf for regulatory expense, based on data derived from answer to the questionnaire. Since it appears to be a reasonable estimate and no participant disputes its inclusion, it will be accepted.

277,616

— 50 —

DEPLETION, DEPRECIATION, AND AMORTIZATION OF PRODUCTION AND INVESTMENT COSTS

Production investment costs include successful well costs, lease acquisition costs and cost of other production facilities. These items were capitalized by the presiding examiner, and we agree. The total of these items will establish the rate base on which a return must be allowed. The amount of the rate base itself must be recovered by the producers by charges for depletion, depreciation and amortization over the period of the economic life of the investment. The procedure we use is to convert DD&A to an Mcf basis and to add an element for return on the production investment per Mcf. We shall discuss separately each item involved in the calculation.

Successful Well Costs

The examiner found that successful well costs amounted to 2.88 cents per Mcf of gas found. He determined this amount by dividing the cost per foot of

successful wells drilled in 1960 by the average of gas reserves added per foot of drilling in a year. The drilling cost per foot was derived from data in the U. S. Bureau of Census, Census of Mineral Industries for 1958, adjusted to 1960 on the basis of the questionnaire data. The total reserves added were derived from the AGA proven reserve statistics.[27]

The Major Producer Group first argues that the Joint Association Survey (JAS)[28] cost per foot of well drilling should be used in place of the 1958 Census data as trended to 1960. In the alternative, they urge that if the 1958 Census cost is used, this cost should not be adjusted downward on the basis of the questionnaire data to arrive at the 1960 cost. They conclude that the successful well drilling cost should be computed at 3.10 cents per Mcf of gas reserves added, rather than 2.88 cents as computed by the presiding examiner.

We agree with the presiding examiner that the JAS statistics should not be used to decide this issue. The presiding examiner has pointed out that the companies included in the JAS were not selected on a random basis, and that filling out and returning the JAS questionnaire was voluntary. The results thus reflect a considerable

---

[27] Identified in this proceeding as Bureau of Mines *Minerals Yearbook*, Vol. II (which is a reprint of the AGA data). The footage used with this data was obtained from *World Oil* magazine.

[28] The JAS is a survey by three industry trade groups and is based on a questionnaire mailed by these groups to all their member companies.

amount of self-selection. Due to the method of selection there is no assurance that the sample is characteristic of the industry as a whole and it should not be used in preference to the 1958 Census, even though cost based upon the 1958 Census was adjusted by trending to determine the comparable 1960 cost.

In our discussion of dry-hole costs we have already dealt with the question whether cost derived from the 1958 Census may properly be trended on the basis of questionnaire data to determine comparable 1960 costs, and affirmed the examiner on this point. We believe it is not only appropriate but necessary to make the same adjustment in this connection. The exceptions in this regard will therefore be denied.

Lease Acquisition Costs

Witness Roseman, on behalf of California Distributors, computed lease acquisition costs at 0.76 cent per Mcf for gas found. In common with all other witnesses on this subject, he determined the cost per Mcf of lease acquisitions on the basis that such cost is directly related to successful well drilling cost. He found that the appropriate figure was 26.4 percent on the basis of data collected in a survey by the Chase Manhattan Bank and data contained in the 1958 Census.

The presiding examiner accepted Roseman's computation of 0.76 cent per Mcf. The Major Producer Group

excepts to this finding, and contends that Witness Park's computation of 1.15 cents per Mcf should be used. Park computed his figure on the basis that lease acquisition cost is 40 percent of successful well cost per Mcf.

We agree with and adopt the presiding examiner's analysis of this question set forth in Appendix B to the initial decision, pages 80-83. The adopted portion, together with an additional analysis reinforcing our conclusion here, is set forth in Appendix B to this opinion.

Cost of Other Production Facilities

The examiner approved 0.31 cent per Mcf for this item which includes lease equipment, related lease facilities and apportioned overhead investment. The 0.31 cent figure is supported by the testimony of Witnesses Roseman and Park, but for different reasons. Witness Park's recommendation was an integral part of a broader presentation which we have not accepted and for that reason we rely on the testimony of Witness Roseman. In substance, Witness Roseman's testimony is that the respondent's gross investment in these items approximates 8½ percent of the gross investment in leases and wells attributable to non-associated gas, and that a comparable percentage of the previously determined lease and well costs should be allowed for these items. We find the amount to be reasonable and we shall affirm the examiner's finding on this point.

Allowance for Growth in Investment

The Major Producer Group contends that in his computation of production investment costs the presiding

examiner should have included an allowance to reflect future increases in investment. We believe

the examiner correctly excluded such an adjustment. Production investment costs are capitalized and recouped, with a return realized from the sale of gas over the period of the life of the investment. This investment is stated in terms of an amount per Mcf of gas found. While the total investment may grow, there is nothing in this record to support a conclusion that there will be an increase in the amount invested per Mcf of gas found. Accordingly, we believe there is no basis for any additional amount as an allowance for growth in production investment costs.

Period of Recovery of Investment

A return must be allowed upon the investment for the average period of recoupment. Having determined the total production investment cost to be 3.95 cents per Mcf, the presiding examiner then estimated that the average period required for return of each dollar of that investment will be 10 years after the resulting gas begins to flow. He reached this conclusion by assuming that the gas will be totally depleted in 20 years, the normal life of a contract, and that the depletion will take place in an equal amount each year. The Major Producer Group and The Superior Oil Company contend that the true

period of depletion is at least 22 years, and that this period rather than 20 years should be the basis of calculation.

These respondents are correct in pointing out that the period of well depletion is somewhat longer than 20 years. More than offsetting, however, is the fact that wells are not depleted uniformly over their producing life. They produce a greater output of gas and condensate during the first years of depletion. Production usually begins to decline some 7 to 12 years after the well begins to flow until, during the last years of depletion, the well is producing only a fraction of its flow in earlier years. While exact figures are not available, it appears that the additional years of minimal production, not included in the examiner's computation, are more than offset by his computing depletion at an even rate rather than taking into account the higher production in early years and the greatly lowered production at the end of the period. Accordingly, the exceptions on this point will be denied.

— 54 —

Lag

Some of the production investment costs must be made in advance of the time that gas begins to flow. Lease acquisitions are often made a substantial time in advance. Expenses for successful wells must be incurred before any gas can be produced. To allow for this lag between investment and first realization of revenue from sale of the re-

sulting gas, the presiding examiner allowed 1 year of so-called "lag time" in addition to the 10-year period in which the average dollar of investment will be recouped after production begins.

The California Distributors urge that no lag period be included. They contend that the investment of funds before gas begins to flow is more than offset by the fact that some of the investment is not made until after gas has been in production for some time. They refer to this as "negative lag."

The Major Producer Group, on the other hand, contends that the lag should be from 3 to 5 years, and that the 1-year period allowed by the examiner is insufficient.

While it is generally conceded that a time gap does exist between the outlays for some productive investment and the initial receipt of income, the evidence in the record is general and vague insofar as it concerns a specific time period. Moreover, this general testimony is offset to a certain extent by the evidence of investment which does not take place until gas has been in production and evidence that some items will be used for only part of the time in which a return will be allowed. There is no precise computation of the average amount of expenditures involved in either the lag or the "negative lag," or of the amounts of time by which these expenditures precede or follow the date when gas begins to flow.

Geological and geophysical expenses and exploratory overhead, both of which may be expended several years before a well begins to produce, are not ordinarily ac-

counted for as part of production investment costs. They are part of exploratory and development costs which are

treated as expenses by the producers in the year in which they are incurred. Successful well drilling costs are approximately 73 percent of the production investment costs. These would ordinarily be incurred within the one year lag before gas begins to flow which the examiner has allowed. Lease acquisition costs may occur earlier, but these are little more than 19 percent of the total production investment costs. The cost of other production facilities, which is approximately 8 percent of the total production investment cost, as here determined, would be incurred largely within the one-year lag period.

Taking into consideration the evidence of both the positive and negative lag, we believe that the presiding examiner's determination on this point should be upheld.

RETURN ALLOWANCE

Rate of Return

Respondents urge the adoption of a rate of return in the range of 16-18 percent on average net investment. In support, they refer to returns previously allowed in producer and pipeline litigation and to the traditional and current earnings experience of numerous industrial and utility categories. Respondents' principal argument is that the risks inherent in exploration are voluntarily in-

CARD 10

curred and extraordinary and they must be recompensed in the rate-making process. They also argue that the discounted cash-flow analysis is the keystone to the producer return issue. The producers also stress the time lag between investment of funds and receipt of income.

Staff, joined by the California interests, presses for a 9½ percent return on average net investment which translates into 10½ percent on common equity. Staff offered extensive testimony which focuses heavily on the earnings experience of integrated producers, who supply the bulk of the natural gas production. Staff supports its reliance on the experience of the integrated producers partly by claiming there is no proof that their non-production departments are less risky than their production departments. Staff recognized the geological

risks inherent in exploration but considers them to a degree offset because of the producers' alleged ability to avoid income taxes, their low-debt capital structure, and the opportunity, implicit in group regulation, for low-cost producers to achieve higher than average returns. For these reasons, Staff concludes that a return must be set in this proceeding which is somewhat lower than that which would be deemed appropriate in the context of individual regulation.

In determining an appropriate rate of return, the Commission must operate within long-accepted judicial

guidelines. Many of them, although established in the context of individual company regulation, apply with equal validity to the *en masse* regulation we have adopted herein. Simply stated, the courts have consistently held that the return must be sufficient to attract new capital, be in line with that earned by comparable industries, *e.g.*, *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591 (1944); *Bluefield Water Works and Improvement Co.* v. *F.P.C.*, 262 U.S. 679 (1923), and most significantly, be determined, not through the automatic application of formulae, but through informed judgment taking into account all relevant facts, *e.g.*, *State Corp. Commission of Kansas* v. *F.P.C.*, 206 F.2d 690 (CA8 1953), cert. denied, 346 U.S. 922 (1954); *Washington Gas Light Co.* v. *Baker*, 188 F.2d 11 (CADC 1950), cert. denied, 340 U.S. 952 (1951).

As a starting point in our analysis, we turn to the financial requirements and experience of a sector of the gas industry with which years of regulation have made us familiar, the natural gas pipelines. The transmission sector is an immediate adjunct of production, and the two have evolved contemporaneously. An examination of recent transmission company rate proceedings indicates that representative companies

are currently being allowed returns on net investment in the 6.0-6.5 percent range, with the preponderance between 6.25-6.5 percent. While we have recently been em-

phasizing the overall return, it is instructive that a 6.25-6.5 percent return on transmission net investment translates, considering current capitalization patterns, into a yield on equity of from 10.0 to 12.0 percent. Although this yield is by no means dispositive of the issue before us, it places the issue of an appropriate rate of return for gas production in a more meaningful context, especially in view of the fact that producers generally are 85 percent equity companies. In addition, production operations inherently involve a greater degree of risk than the transportation of gas.

The difference in the degree of risk is highlighted by the fact that the construction and operation of transmission lines are authorized only upon the issuance of certificates of public convenience and necessity, and these, in turn, require a showing of economic feasibility. *Northern Natural Gas Co.*, 28 FPC 1155 (1962). By contrast a producer who is exploring for new gas is relying largely on the law of averages, especially under the area rate approach.

Transmission companies generally have assured sources of supply, traditionally under at least twenty-year contracts. They are generally able to shift to their purchasers the burden of their costs, and they have a minimal labor problem. Considering these factors, together with the projected continuation of a 3.5 percent growth in consumer demand, the 6.25-6.5 percent overall return and the 10 to 12 percent yield on equity for pipelines can be considered as applying to a relatively safe investment, at least by comparison with gas production.

In comparing the allowable returns on production with the returns previously allowed in transmission proceedings legal precedent and financial requirements dictate that if unusual risks are inherent in production, a greater return should be allowed on investments therein in the absence of record evidence to support a different conclusion. See, *e.g.*, *F.P.C.* v. *Hope Natural Gas Co., supra; F.P.C.* v. *Natural Gas Pipeline Co.*, 315 U.S. 575 (1942); *Bluefield Water Works and Improvement Co.* v. *F.P.C., supra; Wilcox* v. *Consolidated Gas Co.*, 212 U.S. 19 (1909). It is beyond question that the business of exploring for natural gas and, to a lesser extent, its production, is fraught with uncertainties foreign to its transmission. Justice Jackson pointedly expressed this fact in his oft-quoted dissenting statement in the *Hope* case, and the Commission has repeatedly recognized it. Thus, we said in *Phillips*:

> It is clear that the risks of this business [exploration and development] are greater than those of an electric utility or natural gas pipeline. 24 FPC at 572.

We have also noted the special risks involved in production operations:

> The producer must invest his funds prior to ascertaining whether he will have anything to sell or whether, if he does, he will have an adequate market. *Id.* at 543.

And later in *CATCO:*

> We are fully cognizant of the risks of drilling for gas and the need to encourage continued exploration and production. 27 FPC at 106.

And still later in *Southern Natural Gas Co.*, 29 FPC 323, 336 (1963):

> It is well recognized that a series of dry holes or even a single dry hole may bankrupt an independent producer, and it is equally well recognized that an independent producer who has the misfortune to discover high-cost gas may very easily find it impossible to dispose of such gas at a price which returns more than a small fraction of his costs of discovery and development.

The principal uncertainty lies in finding gas in commercial quantities, and is emphasized by the record evidence that producers, while seemingly able to a degree to direct their searches for particular hydrocarbons, have no assurance that any hydrocarbon will be found. The risk of a dry hole — or noncommercial well — is one that has characterized the production activity since its inception. That the risk is not merely theoretical is borne out by the questionnaire data compiled in Staff exhibit 142 which reveals that Permian respondents in 1960 spent approximately $212,342,000 on geological and

geophysical expenses, $114,284,000 on lease rentals and $271,576,000 on dry holes. While it is true that in the aggregate we allow these costs as an operating expense, the uncertainty whether productivity will meet the industry average nevertheless remains as a risk for each individual producer and it must be recognized in the rate-making process.

There is another risk in the production operations which our allowance for a rate of return in this proceeding must reflect — the risk of finding gas of less than pipeline quality. The record reveals that the greater percentage of the gas in the Permian Basin does not fully meet the pipeline quality standards prescribed herein. The details respecting quality adjustments are discussed *infra* at pages 94-103. While we have provided upward adjustments for new gas-well gas with above average Btu content, nevertheless there remains the risk that any gas found can be sold only at an adjusted ceiling price which involves a substantial discount from the ceiling prices for gas of pipeline quality prescribed herein. Such risk is a special factor that must be considered in establishing the rate of return for the Permian Basin.

Agreeing that production operations involve risks which must be recognized in our allowance for rate of return, yet we conclude that the risks are not as great as the producers claim. The producers' case for a 16-18

percent rate of return ignores the fact that there is a degree of predictability to production operations as evidenced by the fact that the industry as a whole has maintained over extended periods a consistent record of new discoveries and added reserves. The producers statistical support for a 16 to 18 percent return rests on data that contain conspicuous infirmities. As pointed out by the examiner, Witness Morton's statistical presentation contains only one instance of an 18 percent rate of return on capitalization. We affirm the examiner's conclusion that Morton's sample is unrepresentative.

The return producers seek is greatly in excess of the recent earnings experience of even the nonintegrated producers. It is three-fold the return allowed on transmission investments and it would produce a yield on common equity of approximately 20 percent. Such a return is neither typical nor necessary, and must be rejected.

We have already discussed the "true yield" method for determining capital cost which expresses the discount rate equating the value of a stream of future revenue with the cost of the initial investment generating that stream. It is employed herein by the producers to demonstrate the earnings rate disparity between it and the conventional method which allows a return on net investment. The witness advancing this unconventional approach has merely urged that the disparity between book yield and "true yield" be recognized in a larger return allowance and provided little in the way of support for the application of his alternative method. In these circum-

stances, his approach cannot be used in resolving the rate of return issue in this case.

We now turn to the earning experience of the production industry to fix the return to be allowed in this proceeding. Staff witness Shaffner's Exhibit 176 analyzed in Schedules 11 and 12 the 1957-1961 rates earned by two classes of producers: those that were principally engaged in production, and those that were also engaged in refining and marketing. The schedules, based on *Moody's Industrials and Annual Reports to Stockholders,* were limited to companies with interstate sales to pipelines in

excess of 2,000,000 Mcf annually, with actively traded common equity, and with a policy of making periodic reports of their earnings posture.

The Staff Exhibit 176, Schedule 11, reveals that the average returns for nine companies confined to production functions in each of the years 1957-1961 were, respectively, 13.9, 10.9 (including an .8 percent return for one company), 12.4, 11.6, and 13.2 percent, which produced an average of 12.4 percent, and a five-year median of 10.9 percent. When only the experience of the seven Permian producers is reflected the returns for the same years are as follows: 15.0, 12.4, 13.9, 12.5, and 13.4 percent, making an average of 13.4 and a median of 11.3 (Exhibit 176, Schedule 12). These

staff figures are consistent with respondent witness Morton's Exhibit 220, showing that 13 producers engaged solely in production, including six not covered by 13.0 and 14.4 percent over the same period. This produced an average return of 14.5 and a slightly lower median of 14.4 percent.

Both the Staff exhibits and the presentation of Witness Morton were limited in the number of individual companies covered; the latter also employed subjective considerations in selection and was forced to report on a less comparable basis. Nevertheless they are the best record indication of what the production function traditionally returns. We conclude that they are entitled to heavy consideration in the decisional process in this case.

Witness Shaffner's second category was comprised of 26 integrated producers. The average return experience for these companies was 10.0, 7.9, 8.1, 8.2, and 8.2 percent for the indicated years, which gave a five-year average of 8.5 percent and a median of 8.1. When limited to the 24 integrated Permian producers, the figures decreased slightly: 9.9, 7.8, 8.0, 8.0, and 7.8 percent, for a five-year average and median of 8.3 and 8.1 percent, respectively.

On a general average basis, the resulting return was 9.5 percent for both the national and Permian producers. On

an average weighted by capitalization basis, both national and Permian-only, the resulting return was 9.3 percent, reflecting that the total capitalization for the 26 integrated companies was over 40 times that of the nine non-integrated companies.

The Shaffner study of the returns of integrated producers standing alone fails to make a persuasive showing that the results are the best evidence of the financial needs of the gas operations of the companies involved. It covers the most widely diversified segment of the industry, those whose revenues were derived from the sale of petrochemicals, fertilizers, plastics and gasoline, as well as from transmission, distribution, real estate and manufacturing enterprises. The exhibits in the record, and the sources upon which they are based, offer no ratio of the integrated company oil and gas production revenues to total revenues, although they do reveal that revenues generated by natural gas sales to pipelines accounted for but 2.22 percent of total revenues. Without a departmental segregation of costs and revenues, it is impossible to calculate production department returns. It may be that on a different record the returns of integrated producers may be shown to be highly relevant but without any assurance that production returns approximate overall returns, we cannot automatically attribute the latter to the former. Accordingly, while we are persuaded that integrated producer returns are relevant to the instant issue, we are not persuaded that the Shaffner exhibit sufficiently weights production operations in his recommended return of 9.5 percent.

After weighing all the evidence on the issue we believe a return of 12 percent is appropriate in light of the considerations previously discussed and the presentations in this case, particularly the testimony of witnesses Shaffner and Morton with respect to the returns by nonintegrated producers in the Permian Basin. A return of 12 percent on production activities protects gas consumers against excessive prices but it is not so low that it fails to respond to the needs of the industry. It also considers the needs of the smaller independent who traditionally drills much of the Permian exploratory footage and his limited resources to weather even a brief series of unproductive expenditures. It may

be that another result may be reached on a different record but in this first area rate proceeding we believe the record points to a return of 12 percent and it is therefore adopted.

The presiding examiner, having determined that the total production investment would be recouped over an average period of 10 years beginning an average of 1 year after investment, correctly concluded that the total return to be allowed on each Mcf of gas should be based on an investment base that is 11 times the production investment per Mcf found. As the production investment was found to be 3.95 cents per Mcf, the investment base here is 43.45 cents. The annual return per Mcf should be

computed by multiplying 43.45 cents by the 12 percent rate of return, producing a figure of 5.21 cents per Mcf.

Return on Working Capital

To the return on net investment must be added the return on a working capital allowance. While in this proceeding the return on the allowance is a small item, it raises a policy question for decision.

Distributor witness Roseman presented a working capital computation in Exhibit 224 which follows the traditional utility formula of allowing in the rate base for a 45-day lag in collections; that is, a return is allowed on the sum of one-eighth of annual production operating expenses, one-eighth of annual exploration expenses, and amounts invested in supplies, materials and prepayments allocated to the exploration and production functions. The resulting allowance is 1.63 cents per Mcf which, at a 9½ percent rate of return, gives a .16 cent return. The presiding examiner accepted the method but, substituting 12 percent, allowed a .20 cent return.

The producers contend that the utility formula is inappropriate for the producing industry because it excludes funds that must be kept available for lease plays, drilling failures and exploration. They point out that their ratio of net plant to total capitalization is far smaller than in the transmission industry, and consequently, recurring cash needs, which are not covered by the return on net

investment, become more significant. The producers advocate a "balance sheet formula" which would allow a full return on the current net assets. They conclude that a representative allowance would be either 23 percent of total capitalization, which is the ratio of actual working capital to total capitalization for the thirteen non-integrated producers covered in their Exhibit 220, or 17 percent, which purportedly represents the ratio found in the Chase Manhattan Bank 1960 study of the actual cash portion of current net assets to net plant for the integrated companies. The Staff reply brief, however, correctly points out that the actual cash portion is but 6.7 percent, the other 10.3 percent representing marketable securities.

Staff and the distributors attack the balance sheet formula. They contend that it inappropriately allows a return on such items as total cash on hand, marketable and capitalized securities, accounts and notes receivable, and — in the case of the integrated producer — current assets applicable to refining and marketing. They argue that because net current assets have no reasonable relationship to the function of the working capital allowance, the balance sheet formula has been uniformly rejected by this Commission and the Courts. Staff concludes that the Commission has regularly employed the utility formula for producers and that other sources assure the availability of sufficient funds. Consequently, no further allowance is appropriate.

The Commission was first presented with a balance sheet approach in *Cities Service Gas Company*, 3 FPC 459 (1943), where it rejected the method as being "* * * unsound and inherently fallacious for ratemaking purposes." 3 FPC at 478. The case was affirmed, 155 F. 2d 694 (CA10), cert. denied, 329 U.S. 773 (1946). The Commission reaffirmed this conclusion in *Northern Natural Gas Co.*, 11 FPC 123 (1952) and the reaffirmance was specifically upheld in *Corp. Comm'n of Kansas* v. *F.P.C.*, 206 F.2d 690 (CA8 1953), cert. denied, 346 U.S. 922 (1954). The method was also rejected in *Panhandle Eastern*

Pipeline Co., 13 FPC 53 (1954), *rev'd on other grounds, City of Detroit* v. *F.P.C.*, 230 F.2d 810 (D. C. Cir. 1955). The balance sheet approach now urged upon the Commission incorporates the same flaws as found in the previous versions of this method. As herein presented, it is insufficiently refined and meaningful to be a legitimate regulatory formula, and we see no reason to depart from the sound reasoning of the *Cities Service* decision.

We are convinced that the balance sheet approach must be rejected and conclude that the four additive factors in the utility formula — cyclical expenses, materials, supplies and prepayments — are justified components of a working capital allowance for the producing industry, and that the formula is appropriate for calculating these

factors. We appreciate, however, that the erratic nature of individual company lease acquisitions, the competition among producers for attractive leaseholds, and the established practice of the industry to generate its own capital, demand that additional liquid sums be kept available. Accordingly, a compensatory "lease play" return must be allowed on reasonable amounts in excess of the working capital allowance based on the traditional utility formula.

Such funds in reasonable amounts are not idle or dormant in a meaningful sense. They are being employed as the exigencies of the business demand: in ready reserve for expenditures upon which the contribution of the industry depends. Such funds are not surplus, because they could not be dissipated without adverse effect on the exploratory effort. Moreover, there is no likelihood that they will be retained merely to inflate rate bases. Producers are relatively assured of receiving a return on funds invested in securities, and they have a fair opportunity of receiving a return on funds invested in the producing industry. Perhaps the most persuasive reason why excess sums are unlikely to be retained is that producers reduce their tax liabilities by a continued investment in the industry; the depletion allowance, by law, can offset no more than 50 percent of net income from a productive lease. This immediate tax benefit accruing from reinvestment far outweighs any incentive to mere accumulation.

We find that the producers must be given a return on the funds retained for lease play in addition to the 0.20 cent per Mcf return allowance computed under the traditional utility formula. An exact amount for this additional allowance is difficult to determine from the present record. Presuming that the producers should be allowed a return on liquid funds on hand equivalent to one and one-half times their per Mcf expenditures for lease acquisitions, return on the allowance for lease play would be approximately 0.15 cent per Mcf.[29] Future proceedings may elicit a more precise method for computing this amount.

For the purposes of this case, 0.15 cent per Mcf will be added to working capital as a lease play return allowance, making the total return on working capital 0.35 cent per Mcf.

ROYALTIES

Both Witness Roseman and Witness Park included royalties at the rate of 12.5 percent in their computations of cost. The presiding examiner accepted this figure and no participant demurs to the inclusion of such an item or to the 12.5 percentage. The examiner's figure of 2.11 cents per Mcf will be adjusted to 2.05 cents per

[29] As determined herein, the annual lease acquisition cost per Mcf is 0.76 cent. A lease play allowance based on a 12 percent rate of return on one and one-half times this 0.76 cent per Mcf amount would be .137 cents per Mcf.

Mcf to reflect the changes in the total amount on which the 12.5 percent royalty is computed.

PRODUCTION TAXES

The present Texas production tax is at the rate of 7 percent of lease revenues. Production taxes in New Mexico are somewhat lower than in Texas. The presiding examiner used a weighted average of Texas and New Mexico production taxes, which he computed to be 6.42 percent after taking into account the latest increase in New Mexico taxes.

We think that reasonable local taxes are a valid basis for a difference in ceiling prices between one area and another and if reasonable the tax applicable in each state should be applied to the gas produced in that state. The 7 percent tax in Texas is at approximately the maximum level of taxes which we have allowed to be passed on by the producer to the purchaser. Accordingly, the full amount of taxes actually incurred either in Texas or New Mexico will be allowed as a component of the total price per Mcf of gas. Since the greater part of gas produced within the Permian Basin is subject to the jurisdiction of the State of Texas, all ceiling prices set forth in this opinion will be stated in amounts applicable to gas produced within the taxing jurisdiction of that state. However, the ceiling price for sales in New

Mexico will reflect the applicable tax in that state and will, accordingly, be at lower levels.

In the event of any increase in taxes in Texas or New Mexico, the Commission will consider whether ceiling prices shall be increased and, if so, to what extent.

The ceiling price here established will be the total amount to be paid by the buyer of gas, including all tax reimbursements provided by contract.

— 68 —

INCOME TAXES

Respondents presented no evidence that any income tax allowance should be included in the computation of cost of new gas-well gas. Their witnesses, Park and Keane, included no such allowance. At stated by the examiner, the testimony of Staff Witness Lyon shows that if the industry's growth is considered, there will be no Federal income tax liability at any return up to 15 percent. The Major Producer Group argues that 0.6 cent per Mcf should be included in the cost computation, representing income tax liability upon a return at the rate of 12.5 percent based on testimony by Witness Roseman. However, Roseman qualified his calculation by stating that many major companies in the past have been found to pay no income taxes, and that there is no evidence that taxes would in fact be paid. He further indicated that his computations should be revised in the light of additional data which was never introduced into the record.

In these circumstances we think the analysis of Witness Lyon was properly accepted by the examiner and we affirm his conclusion on this issue.

THE RATE FOR NEW GAS-WELL GAS

As we have stated the basic standard for determining the price of new gas-well gas is the cost-finding technique we have employed herein. However, in determining the price for each particular area the Commission must, of course, consider other relevant factors in the area. The factors which are commonly considered in the design of rates include the impact of the prescribed rate on existing rate structures, the quality of the gas in the area, the historical prices in the area and other such factors.

The presiding examiner made two adjustments from his cost base on account of such factors in designing his ceiling price for the Permian Basin. Both were of major size. One was a downward adjustment of 1.25 cents in the ceiling price for new gas-well gas (his so-called "location factor") to reflect the fact that historically the average initial price for new gas in the Permian Basin has been lower than the comparable price in the 7 southwestern

states.[30] The second adjustment was in the other direction and consisted of an addition of 1.0 cent as a so-

[30] He used the seven southwestern states because figures for continental United States were not available.

called "gold standard" to reflect the fact that much of the gas in the Permian Basin was of less than pipeline quality and his view that such a premium should be permitted for pipeline quality gas.

We do not believe that either of these adjustments is appropriate. Rates should of course be designed so as to minimize any disturbances of existing pricing patterns to the extent possible consistent with the basic regulatory standards. However, nothing in the record in this case suggests that the ceiling prices we are prescribing for the Permian Basin require any such adjustments. No adjustment for "location factor", whatever that vague concept may mean, is required or is appropriate in this proceeding, either in the amount prescribed by the examiner or in any other amount.

As to the "gold standard" adjustment, we have made clear that the ceiling prices prescribed herein apply as true ceilings for gas or pipeline quality and we have accordingly prescribed standards of pipeline quality. These standards provide for both upward and downward adjustments in the ceiling price for new gas-well gas. The record is deficient as to the overall financial impact of these adjustments but in our determination of rate of return we have recognized that producers in the Permian Basin incur the risk that the gas they find and produce may not command the ceiling price. The absence of any definitive record support for a "gold standard" adjustment coupled with our reflection of the quality problem in fixing the rate of return satisfies us that area revenue requirements will be met.

In summary, when all of these factors are considered there is no justification in this area for any adjustment of a cost-determined ceiling price. We state again

that the ceiling price we are here establishing is for the Permian Basin and that it is entirely possible that in other areas non-cost considerations may require adjustment of the cost figures in establishing the ceiling prices. We hold only that no such adjustments are required in the Permian Basin on the basis of this record. Accordingly we shall round off the cost determined price of 16.43 cents and prescribe a ceiling price for new gas-well gas of pipeline quality in the Permian Basin at 16.5 cents per Mcf at 14.65 psia for gas produced and sold in Texas. The ceiling in Texas includes a production tax of 1.01 cents, which we round off to 1.0 cent, leaving a rate less production taxes of 15.5 cents. For gas produced and sold in the three New Mexico counties, Chavez, Lea and Eddy, the ceiling price shall therefore be 15.5 cents at 14.65 psia plus the applicable production taxes in effect as of the date of this opinion. These prices will apply to residue gas derived from new gas-well gas (see discussion pp. 75-76).

RATIONALE FOR A UNIFORM CEILING PRICE FOR FLOWING GAS

Casinghead Gas

Casinghead gas is the common name for gas produced from oil wells in conjunction with the production of oil.

For purposes of the application of our ceiling prices herein, we shall follow the existing classification of casinghead gas by the appropriate state agency. Casinghead gas is often higher in Btu content than either residue or gas-well gas, and usually contains valuable liquids which are extracted before the gas is delivered to a pipeline. Casinghead gas is often delivered at low pressures, sometimes as low as 5 psig. Since oil wells in the Permian Basin are subject to restraints imposed by state regulation upon the amount of oil produced, casinghead gas can be obtained from a given well only for the period each month that oil is under state oil production controls. Correspondingly since oil is the major product of an oil well, taking the casinghead gas cannot be deferred for any length of time for the buyer's convenience; it must be taken at the time the oil is produced, and the amount of gas is related to the oil production.

Accordingly casinghead gas is not subject to the exclusive control of the buyer as to time of delivery. Ordinarily, however, processing plants will schedule deliveries from the various wells which they service in such manner as to maintain a substantially even output, so that irregularities in deliveries from particular wells are overcome to some extent for the pipeline purchasers from the processing plants. Nevertheless, this limitation on the deliverability of casinghead sometimes requires the pipelines to draw on additional gas-well gas to meet their commit-

ments, and gas-well gas sources therefore provide a valuable flexibility in meeting the peak requirements of the pipelines.

Most of the casinghead gas sold in the Permian Basin is sold to processing plants under percentage contracts, which provide that the processors shall pay to the producers a stipulated percentage of the price which the processors receive upon sale of the residue gas plus an agreed percentage of the proceeds of sale of the extracted liquids. Under these arrangements, the price paid by the processor is immaterial to the consumer so long as the price of the residue gas conforms with the ceiling price established for such gas in this proceeding. The processor is controlled by certificate and rate schedule filings and producers who sell casinghead gas under such percentage contracts are not permitted to file rate schedules with this Commission (Regulations Under the Natural Gas Act, Sec. 154.91(e)). So far as such producers are concerned, any separate ceiling price for casinghead gas would have no application.

The second major type of contract under which casinghead gas is sold in the Permian Basin is the so-called Spraberry or El Paso contract. These contracts provide for the purchase of casinghead gas by a pipeline which processes the gas, pays the producer a percentage of the proceeds from the sale of the extracted liquids, plus a fixed price for the residue gas delivered to the

pipeline. The examiner held that the payment arrangements provided for in the Spraberry contracts must be discontinued. He fixed ceiling prices of 10 cents per Mcf for old casinghead gas and 11 cents per Mcf for new casinghead gas, to be paid for the raw stream (including liquids) without any additional compensation to the producers in the form of a percentage of the liquids or of the price received for them. In effect he outlawed the Spraberry contracts and declared that only a flat amount, limited by the separate casinghead gas ceilings, could be paid for casinghead gas purchased under the Spraberry contracts.

The Major Producer Group has taken strong exception to this ruling, contending that pipelines will not be able to purchase casinghead gas if the presiding examiner's proposal is implemented because producers would then prefer to sell to the processors under percentage contracts. They also assert that the Commission has no jurisdiction over the division of the extracted liquids.

We believe the presiding examiner was correct in holding that the sale of the casinghead gas to the pipeline under the Spraberry type contract is subject to Commission jurisdiction, and that this Commission has the power to regulate the price for the raw gas purchased even though it may include the heavier molecules which can easily be liquified. The form of the contract provides for the transfer of title to the gas as casinghead or raw

stream gas but the method of payment is based upon a specified price per Mcf for the residue volumes of gas and a percentage payment of liquid revenues. The Commission has no jurisdiction over the price at which liquids are sold but if payment for the raw stream is made in whole or in part on the basis of a percentage of liquids or liquid revenues, the Commission may still consider the liquid credits in controlling the amount of the payment for the gas.

The fact that the transaction is subject to our jurisdiction does not mean, however, that we must reject a common form of contract which has been found useful in the industry. We believe that regulation should utilize industry practices developed by the parties to meet industry problems to the extent consistent with maintaining effective regulation. The Spraberry contracts govern approximately 20 percent of the gas sold in the Permian Basin, and we do not think they should be discarded unless it can be shown that they give rise to abuses or evasions, or result in unjust and unreasonable prices to consumers. So long as the cost to the pipelines for residue gas under the Spraberry contracts does not exceed the applicable ceiling price for gas of similar quality, we see no reason to require the elimination of the Spraberry contracts.

There is no evidence in this proceeding that the pipelines' cost of gathering and processing the casinghead gas

purchased under Spraberry contracts is greater than the revenues realized by the pipeline from the liquids extracted. As long as the liquid revenues to the pipeline equal or exceed the processing and gathering costs the consumer will be adequately protected by the ceiling here established for residue gas. If the cost of gathering and processing exceeds the pipelines' liquid revenues by an amount which, if added to the price paid for the residue gas, would exceed the ceiling price applicable to residue gas of similar quality, and appropriate reductions of the price cannot be negotiated, the purchasing pipeline may petition the Commission for relief pursuant to Section 5(a) of the Act by ordering an appropriate reduction in the price the pipeline pays for such residue gas.

Aside from gas sold under percentage contracts and Spraberry type contracts, only a negligible amount of casinghead gas is sold in the Permian Basin. In 1960, only three such contracts involved sales in interstate commerce of Permian Basin casinghead gas to pipelines. These contracts involved total revenues of less than $200,000 in 1960. The impact of these contracts upon prices to be paid by the ultimate consumer is *de minimis*. The contract prices were all under 14 cents. Additional reductions in price for quality deficiencies would reduce the actually realized prices still further. The effect of these contracts is too small to warrant the establishment of a separate ceiling price for casinghead gas.

Aside from percentage contracts, there are also few contracts for sales in interstate commerce of casinghead gas to producer-owned processing plants in the Permian Basin. These contracts will have no direct effect upon the cost to the pipelines and the ultimate cost to the consumer, since the resulting residue gas sold by the processing plants will be subject to the ceiling price herein established for residue gas derived from casinghead. In the event it should be determined that these contracts have a sufficient effect upon the cost of the processing plants so that the latter must seek relief before this Commission, we may then consider whether the prices under such contracts must be subjected to additional regulation. The record in this proceeding does not reveal the need for any such regulation. In general, the prices under such contracts are at sufficiently low levels so that the processors should be sufficiently protected. We establish herein a ceiling price for all gas (except new gas-well gas and residue derived therefrom) which will be applicable, of course, to such contracts.

We believe it is of great importance to simplify the system of area rate ceilings to the extent practicable consistent with an effective system of price controls. In this light we conclude that there is no need for a separate casinghead gas ceiling in the Permian Basin at this time. In the future, should the lack of such a ceiling be found to encourage evasions of the general price ceiling, a

separate ceiling price for casinghead gas may be established. With respect to the Spraberry contracts and all other contracts which, in addition to a payment for residue gas, call for payment for a percentage of liquids or turning over a percentage of the liquids to the producer, any alteration in the price paid for the residue gas or the percentage of the liquids due to the producer will be considered a rate change which must be filed with this Commission and the right to make such rate changes will be subject to the moratorium on rate increases imposed herein. *Future contracts* embodying such provisions are to be certificated only where the liquid percentage to be retained by the processor or the pipeline equals or

exceeds the cost of gathering and processing performed by the processor or pipeline, or where the price to be paid for the residue gas is reduced below the applicable ceiling sufficiently to offset processing and gathering costs in excess of the value of the liquids retained by the processor or pipeline. In the absence of a contrary showing, percentages similar to those now in effect will be assumed to be compensatory and will be approved in future contracts for comparable gas under comparable circumstances.

Residue Gas

Residue gas is the gas remaining after casinghead gas or gas-well gas has been processed to remove liquids pres-

ent in the raw gas stream in the form of vapor or droplets. Only three to four percent of the residue gas produced in the Permian Basin is derived from gas-well gas; between 96 and 97 percent comes from casinghead gas.

Residue gas in the Permian Basin is delivered at somewhat lower pressures, on the whole, than is gas-well gas. Most residue gas is delivered at pressures below 800 pounds, but deliveries of gas-well gas at pressures of 1,000 pounds and up are not uncommon. The cost of raising the pressure of gas to a given point is not proportionate to the added pressure, but is determined by the number of stages of compression (and the compression ratio) necessary to create the desired pressure. To raise the pressure of gas from 600 pounds to 800 pounds will normally cost little more than to raise it from 700 pounds to 800, since in each case only one stage of compression will be necessary.

For purposes of applying the area prices prescribed herein, the ceiling price for new gas-well gas will be applicable to residue gas which is derived from new gas-well gas and the ceiling price for all other gas will be applicable to residue gas derived from casinghead gas or old gas-well gas.

277,642

— 76 —

We regard our determination that all gas should be priced on the same basis as old gas-well gas (except for the top ceiling we have established to encourage the

search for new gas-well gas which is applicable to such gas whether or not it has been processed) as an important step toward simplified and realistic area price regulation. It is apparent, on this record, that no realistic cost of oil-well gas either as casinghead gas or residue gas can be established and that the various apportionments of the joint costs of gas and oil, or gas and liquids, do not yield results which may be accepted as reliable guides. The evidence in this case and the practical administration of area prices dictates that casinghead gas, residue gas derived therefrom, and old gas-well gas, should be similarly priced. Unlike new gas-well gas, there is no basis on this record for differentiation because of the incentive effect, or otherwise.

The examiner would provide separate ceiling prices for old residue gas and new residue gas. We do not believe such a complication of the area pricing structure is necessary or desirable. We have already made clear that the higher ceiling price for new gas-well gas will apply in the case of residue gas derived therefrom. However, over 96 percent of the residue gas produced in the Permian Basin is derived from oil wells, not gas wells. It results from the search for oil, which will not be stimulated appreciably by a higher price for gas. There is thus little to be expected in the way of increased gas supplies from providing a higher price for such residue gas. All residue gas derived from oil-well gas, therefore, will be subject to the same ceiling price as old gas-well gas.

As stated above, we adopt the presiding examiner's finding that residue gas derived from new gas-well gas is to be subject to the new gas-well gas ceiling. If this were not the case, producers of new gas-well gas would be deterred from selling such gas to a processor from whom they were unable to obtain new gas-well gas prices. With equal prices, gas-well gas will be sold to a processing

plant whenever the sum received for the liquids exceeds the cost of processing. This is as it should be for it would be contrary both to good conservation practice and good economics for price regulation to interfere with the normal operation of market forces where these forces tend to provide the greatest possible benefits to the economy as a whole.

Hunt urges that residue gas must be priced higher than gas-well gas so that a processor selling residue gas can cover his processing costs plus a return on his investment in addition to the price of the gas-well gas he purchases. This reasoning ignores the fact that saleable liquid hydrocarbons are derived from the gas that is processed. The principal purpose of such processing is the removal of these liquids so that revenue may be realized from them. There is every reason to believe that the value of the liquids will be sufficient to justify gasoline plant processing of new gas-well gas. If not, there is no apparent economic reason to encourage the processing at gasoline plants.

We therefore reject the argument that the price of residue gas derived from gas-well gas should exceed that of gas-well gas. For the future, if processors of gas-well gas cannot buy gas-well gas at a price which enables them to make a profit on their operations at the ceiling prices we prescribe, we assume that such gas will not be processed by the producers. As to presently existing contracts by processors for the purchase of gas-well gas, if proper price relationships cannot be negotiated relief may be afforded in a proper case under the special relief provisions set forth later in this opinion. There should be very few of such cases, in view of the extremely small percentage of residue gas derived from gas-well gas.

The Rate for Flowing Gas[31]

Basic Approach

In the previous section we explained why a separate ceiling is not appropriate for casinghead gas or for residue gas derived therefrom and why the cost of old gas-well gas may appropriately constitute the basic yardstick for establishing a single ceiling price applicable to all gas

[31] The term flowing gas in this section will be used to include all gas other than new gas-well gas or residue gas derived therefrom. It includes old gas-well gas, all casinghead gas, and residue derived from old gas-well gas or casinghead gas.

other than new gas-well gas. We proceed with a determination of the cost of old gas-well gas.

The examiner determined the cost of old gas-well gas by employing virtually the same method he used to establish the price of new gas-well gas, with certain cost components adjusted by trending to approximate cost levels in the prior years when the old gas-well gas entered the interstate market. The State of California and the Public Utilities Commission of California have urged that the historical composite cost-of-service for the Permian Basin area based on questionnaire data be used to determine the price of old gas-well gas. Staff's basic case consisted of a composite historical cost-of-service presentation which California Distributors and Staff in its reply brief suggest should be used as a check on the examiner's method of computation of the cost of old gas-well gas.

As we have previously found, the examiner's method which is designed to approximate needed expenditures for finding and producing future gas-well gas supplies is the proper one for fixing the price of new gas-well gas. However, flowing gas is in a different category. Changes in the price cannot increase substantially the total amounts of gas which are already dedicated to interstate commerce[32] nor can they materially affect the supply of oil-well gas which is discovered as a by-product of the search for oil, although they could to some extent affect

[32] To a small extent the price might affect the stage at which wells are abandoned because the proceeds of operation do not defray out-of-pocket costs.

the amount dedicated to interstate commerce in the future. The revenues received from flowing gas, should, therefore, be based on composite historical costs, including a fair allowance for expenditures for E & D. The price for flowing gas must also reflect the producers' need for revenues from their present sales to support future discoveries.

We believe that the most solid basis in the record for determining the just and reasonable price of old gas-well gas is the composite cost-of-service presentation for the Permian Basin made by the Commission's Staff. The presentation uses 1960 as a test year to determine the cost of old gas-well gas. An approach based on historical costs for flowing gas enables us to draw on the cost finding techniques applied in previous producer cases on an individual company basis. We shall, therefore, use the composite historical cost-of-service for old gas-well gas, for the 1960 test year, as the basis for the flowing gas price. While we place primary reliance on Staff's cost-of-service presentation, we shall later show that the examiner's method of trending back the new gas-well gas cost yields approximately the same cost and thus serves as a useful verification of our result.

It should be noted that we are utilizing a different cost-finding approach for flowing gas than that used in calculating the cost of new gas-well gas. The cost of new gas-well gas was geared to the cost of finding and

producing future gas supplies and as such was built up primarily from nationally published statistics and the questionnaire data which to a large extent identified costs that could be related to gas-well gas. We were thereby enabled to minimize the need for allocations. However, with regard to flowing gas our touchstone is the historical cost of the gas being produced in the Permian Basin in 1960. The primary data includes joint product lease costs and joint E & D expenditures, whereas for new gas-well gas the parties developed cost-finding techniques that minimized the allocation problems. In deriving the cost of the flowing gas-well gas, therefore, it is necessary to utilize allocations to a greater degree than for new gas-well gas (although to a much less extent than with casinghead gas) and for this reason the details of the cost computations of new gas and flowing gas will not be comparable.

277,646

— 80 —

The basic evidence utilized in Staff's composite cost presentation was collected for 1960. In addition, certain trend information was obtained for prior years. These and related data reveal that the 1960 level of costs is fairly representative of the costs during the three year period ending in 1960. While unit costs were somewhat lower in the earlier years, they leveled off in 1958 and so far as the evidence shows have never since exceeded this level. The 1960 test year is, therefore, typical of current and future costs of the flowing gas and it is also

more than fair to the producers as a basis for just and reasonable prices for the prior years when costs were slightly lower. The alternative of a separate cost study for each of the years prior to 1960 would have presented an almost impossible task. At best it would have prolonged this proceeding greatly. Such an effort was not justified since little gas was selling in the 1954-1957 period at prices even approaching our ceiling as established herein.

Preliminary Questions

An initial question in using the composite cost-of-service approach for determining the rate for flowing gas is whether production costs should be determined on the basis of nationwide costs incurred by the producers operating in the Permian Basin or whether their Permian costs alone should be used. While the staff presented its evidence derived from the questionnaires to show costs both ways, it argued that the emphasis should be on the Permian Basin cost experience. The producers, on the other hand, argue that the nationwide basis should be used.

Other than for E&D, the data is available in the record to determine the costs incurred in the Permian Basin. The ceiling price we fix herein is an area rate for flowing gas in the Permian Basin, not a national price, and in our opinion should be based primarily on area costs.

The Major Producer Group argues that if area costs are used the demand for gas would tend to concentrate in the lower cost and lower priced areas at the same time that the lower

prices would tend to discourage exploration and restrict supply in the area. This argument, if valid at all, would apply only to new gas-well gas where the price we fix could materially affect future discoveries, and there we rely on national data. We are here determining costs and rates for flowing gas in the Permian Basin and for such gas we shall, therefore, use Permian costs to the extent feasible.

While the principle is important the issue is not a major one in this area because the difference between national and area production costs is approximately 0.25 cents per Mcf in Staff's presentation.

A further preliminary question arises as to the use of the questionnaire data from Appendix C, the simplified form designed for producers with less than 10,000,000 Mcf of annual jurisdictional sales in 1960. The Commission's Appendix B is a comprehensive questionnaire designed for the major producers, those with 1960 jurisdictional sales in excess of 10,000,000 Mcf. Replies to the major questionnaire (Appendix B) were received in complete form from 67 respondents in the area. These respondents included 42 major producers[33] and 25 producers of less than 10,000,000 Mcf who voluntarily com-

[33] This total includes all the major producers in the area, except one who did not fill out the questionnaire in a usable manner, although given ample opportunity to do so.

pleted the form.[34] Appendix C questionnaires were mailed to all of the over 350 small producers in the area but responses were filed by only 105 of them. Of these only 60 were sufficiently complete to be compiled. The Commission's staff computed the results of the responses to Appendix C separately but included the Appendix C data in its composite cost of service.

The examiner concluded that the data provided by the major producers with respect to their Permian production was fully representative of area costs, but that the response from the small producers in the Appendix C group could not be used because the percentage coverage of the small producers was not large nor was the same sample random.

We agree with the reasoning of the examiner. The issue is of a *de minimis* nature in any event because the percentage of gas produced in the Permian Basin by such producers is so small so that the results could not be affected appreciably. The unit cost of gas in this proceeding would be increased by less than 0.07 cents per Mcf even if Appendix C returns were included. In these circumstances we shall rely exclusively on the Appendix B cost data.

---

[34] The returns from these 25 producers do not affect the cost computations to an extent that would change the results.

(277,648)

The Composition of Costs

The total costs upon which the price for flowing gas is to be based may be divided into two principal categories: (1) production costs, which include operating expenses and DD&A (depreciation, depletion and amortization), as well as a return on the production investment and (2) exploration and development costs (E & D), which includes an allowance for the expenses incurred in the search for gas. We are not concerned with the gasoline plant costs which the staff considered and treated at some length because, as already explained, in this area we are determining a price based on the cost of gas-well gas which will also apply to residue gas from other than new gas-well gas.

Production Costs

The compilation of the production costs by the staff is essentially the task of compositing by type of lease the items reported by the producers in response to the Commission's questionnaire and allocating the costs between gas and other products. The allocation problems which we shall discuss herein are the principal difficulties, but there are a number of other issues which must be resolved. They include the treatment of combination leases, corporate common costs, reinjected volumes, the development of oil and gas legs for

277,649

— 83 —

allocation of production costs, and lease play allowance. These somewhat technical issues are discussed in Appen-

dix C to this opinion. Otherwise the computation of the composite unit costs of production operating expenses, the composite rate base and the allowance for DD&A, simply involve the arithmetic of compiling the appropriate data. The results are shown in the summary at page 85.

Allocation of Production Costs by the Relative Cost Method

There is of course no allocation problem in computing the production costs of dry gas-well gas. However allocations are necessary for the gas from gas condensate reservoirs. In computing the production operating costs for flowing gas-well gas we shall utilize the relative cost method to divide the joint production costs between the liquids and the gas on the gas condensate leases with lease separation.[35] The basic rationale of the relative cost method is that joint production costs should be allocated in relation to the separate production costs of oil and gas. This method is analogous to the procedure used by United States agencies and approved by this Commission to allocate the cost of a multi-purpose hydroelectric dam between power, flood control and other beneficial uses.[36] The cost of the portions of a dam used for more than one purpose is allocated in accordance with

---

[35] "Lease separation" refers to the separation of condensate liquids from the gas on the leased property, rather than by later processing.

[36] See, for example, order issued March 5, 1965, in Docket No. E-6383, Allocation of Costs, McNary Project, Columbia River Washington-Oregon, and attached Bureau of Power report.

the relative cost of a separate dam or other required facility for each purpose. Here the relative cost of each coproduct, gas and oil, is used as the basis of allocating the cost of producing the two products jointly.

The first step in the relative cost method is to determine the unit cost of oil from leases producing oil only (the "oil leg") and the unit cost of gas from leases producing gas only (the "gas leg"). The unit cost for each of the two separate products is then multiplied by the volumes of liquid and gas produced on the joint production leases. This provides a total relative cost for the liquids and gas produced on such leases and a ratio of gas cost to

total cost. This ratio is then applied to the total cost of the gas condensate leases in order to obtain the unit costs as they apply to the jointly produced gas.

While producer-respondents and the presiding examiner have questioned the use of the relative cost allocation method, it is relatively simple and workable, has been accepted in principle in our electric power work for decades, and has been repeatedly used and approved by the Commission in producer rate cases. *Phillips Petroleum Co.*, 24 FPC 537 (1960), affirmed *sub nom. Wisconsin* v. *F.P.C.*, 303 F. 2d 830 (1961), affirmed 373 U.S. 294 (1963), especially at pages 553 *et seq.*; *Hunt Oil Co., et al.*, 28 FPC 623, 624 (1962). The reasoning which supports the relative cost method of

allocation in computing individual company costs is equally applicable to composite area costs. The detailed application of the method and the arguments against it are dealt with in Appendix C.

Rate of Return

Among the most important issues is the rate of return for flowing gas. We have already discussed in detail the many factors which led us to conclude that a 12 percent return is appropriate. Two of these factors warrant a somewhat different treatment in considering the appropriate return for flowing gas. First, the great bulk of the flowing gas was not found as the result of exploration or development directed toward gas but rather as an incident to the search for oil. In evaluating the risk factor for flowing gas we must therefore consider that there was by no means the same degree of risk knowingly undertaken in finding such gas as in the case of new gas-well gas. On the other hand, much of the flowing gas in the Permian Basin is below pipeline quality and thus will not command the ceiling price prescribed herein and this problem of low quality is more pronounced in flowing gas than in new gas-well gas.

In our judgment these two factors of lesser and greater risk considered together with the other considerations in our previous discussion of rate of return, which apply equally to flowing gas, persuade us that a 12 percent return is appropriate. Also relevant to our conclusion is the fact that revenues from flowing gas are a factor in the

scale of exploration for new gas. Moreover, flowing gas includes new accretions of casinghead gas and residue gas resulting therefrom, the price of which may well determine the extent to which such gas is committed to the interstate market. Accordingly, we shall allow a 12 percent return on flowing gas.

Summary of Production Costs

Employing the relative cost method, making the other necessary determinations as discussed in Appendix C, and using the 12 percent rate of return, we arrive at 9.16 cents per Mcf for production costs, consisting of the following:

Production operating expenses	1.75
Depreciation, depletion and amortization	2.42
Return	4.99
	9.16

Exploration and Development Costs

Exploration and development costs pose a different problem than production costs. E & D covers dry hole expenses, geological and geophysical expenses, lease rentals, cancelled and surrendered lease expenses, and all other costs expended on nonproductive properties in the effort to find gas. Expenditures for E & D are not earmarked for particular producing areas but on the contrary are incurred on a nationwide basis by the major producers, who make these expenditures largely in accor-

dance with prospects for discovery rather than on an area-directed basis. No one disputes the fact that the E & D allowance for flowing gas should be computed on a nationwide basis.

The principal problem is the proper allocation of total E & D expenditures between gas and liquids. The allocation problem is illustrated in our *Phillips* opinion, 24 FPC 537, 555-562 (1960). After closely analyzing many possible allocation approaches the Commission adopted the use of the modified Btu method in the *Phillips* case and reaffirmed it in *Continental Oil Company*, 27 FPC 96, 104 (1962); *Hunt Oil Company*, 28 FPC 623, 624 (1962); and *H. L. Hunt*, 28 FPC 897, 901 (1962).

The modified Btu method of allocation in the *Phillips* case was designed to utilize as a basic standard the relation of the fuel value of gas to the fuel value of oil, but at the same time adjust this relationship to reflect economic trends and the needs of the public for continued exploration and development. Thus the Commission considered not only the ratio of Btu's in a barrel of oil and in an Mcf of gas (about 6 to 1 for *Phillips* production), but also the increasing demand for gas compared to oil, the deeper drilling needed in exploring for gas, the upward trend of gas production, the ratio of the market price of gas to the price of oil, and other matters. Emphasizing that its determination was based on judgment, the Commission determined that an economic

factor of 4 should be applied to the Btu content of oil to allocate *Phillips'* exploration costs. The resulting cost relationship of finding an Mcf of gas to one barrel of oil was then about 1 to 24, rather than 1 to 6 as on a straight Btu basis. The Commission pointed out that the result might well be different in a case, unlike *Phillips*, where rates were being determined for the future.

In the present area proceeding Staff, through Witness Lyon, advocated the general method used in *Phillips*, with certain refinements, the principal one being the use of separate economic factors for gas-well gas and casing-head gas, in place of the single factor provided in *Phillips*. The total national costs were apportioned by the Staff to the lease products on the basis of these factors, the amounts so allocated were divided by the respective national volumes of the lease products to determine national unit allowances, and these unit values were then imputed to the Permian sales.

The respondents proceeded differently. They propose to allocate the expenses of developmental dry holes on the basis of the well drilling intentions of certain producers who were polled, the expenses of exploratory dry holes on the basis of intangible drilling costs associated with successful wells, and remaining exploratory expenses on the basis of successful expenditures for gas reservoir reserves compared to oil reservoirs. For the separation of gas and condensate, respondents would convert the condensate back to vapor and allocate costs on the basis of the relative vapor volumes of the gas and the condensate.

The examiner correctly found the respondents' method unsound because it ignores the economic purpose of the driller. While a barrel of condensate is worth some 20 times the value of an Mcf of gas, under the producer's vapor volumetric method an Mcf of gas would be assigned about the same E & D expenses as a barrel of liquids which vaporizes to about the same volume as an Mcf of gas. We may also note that in the allocation of developmental dry hole costs there was a considerable degree of self-selection in the responses from the polled producers. Expressions of "intention" also involve subjective considerations. The data obtained are not the result of a random sample of all producers on an objective basis and do not offer a reliable foundation for fixing prices.

We have reviewed the evidence in the record on this issue and believe that Staff's general approach to the problem is sound but that the breakdown between gas-well gas and casinghead gas is an unnecessary complication of the allocation procedures.[37] The issue is one of exercising reasonable judgment in allocating the total cost between the coproducts.

The basic staff method has been attacked by both the producers and the examiner as being circuitous, in that

[37] The further breakdown between gas-well gas and casinghead gas would result in only a difference of 0.12 cents in the E & D expense allocated to flowing gas-well gas and involves the use of questionable value differentials.

the existing price of flowing gas-well gas is used as one of the bases for determining what the price of flowing gas-well gas should be. We are now able to remove an element of circuitry from such an allocation by reason of the fact that we have computed a cost of new gas-well gas of 16½ cents per Mcf by an independent cost finding technique. We are thus able to relate the price of oil fixed by the marketplace to a separately established price of gas, to aid us in making these allocations.

The record indicates that the 1960 average price in the field for liquids is $2.90 per barrel which would be related to the 16½ cents per Mcf price of gas which we have established herein. The questionnaire data in this record reveals that the ratio of Btu's in a barrel of liquids to Btu's in an Mcf of gas-well gas is 5.1 to 1. Utilizing this Btu ratio and the independently established

prices previously mentioned we arrive at a value relationship of a Btu of liquids to a Btu of gas-well gas of 3.45 to 1.[38]

There are other factors which must be considered in arriving at the economic factor for determining the appropriate allocations of E & D expenses between gas and oil. One such guide is the fact, established in the record, that the production costs of a Btu of oil are roughly 4½ times

[38] The price ratio of $2.90 per barrel of oil to 16.5 cents per Mcf of gas is 17.6 to 1. This ratio is then divided by the 5.1 to 1.0 Btu ratio to determine the value relationship of 3.45 to 1.

that of a Btu of gas. Another factor to be considered is that the 16½ cents price is one that we have determined to be appropriate for the future for new gas-well gas and that the price of gas moved sharply upward during the 1950's in relation to the price of crude oil. We must also consider that we are determining a cost to be used for fixing prices for flowing gas for the future as well as for the past.

These considerations and the other data from the record relating to the allocation question, lead us to conclude that in allocating total E & D expenses, an economic factor of 3.5 should be applied to the Btu's of crude oil and condensate liquids production as compared with an economic factor of 1.0 for the Btu's of all gas. Allocations on a Btu basis so adjusted in our judgment will give proportionate weight to the costs, prices, quality and other economic relationships of the respective hydrocarbons.

We also believe that these relative weightings should be applied to the national production of hydrocarbons, rather than to the Permian Basin production because E & D is conducted on a national basis.[39]

Applying these factors to the national production, the E & D costs for flowing gas-well gas would be 4.08 cents. The details of the computation are shown in Appendix C, pages 11-12.

[39] There is in this case little difference in the practical result, since the application of these factors to area production rather than to national production would change the results of the cost computation by approximately .01 cent.

crease filings were approved on the basis of cost evidence.[7] In other cases where the producer failed to submit evidence founded on the conventional rate base method of regulation, the Commission dismissed the rate increase[8] on the assumption that in the absence of such cost support it was bound to do so by *City of Detroit* v. *F.P.C.*, 230 F. 2d 810 (CADC, 1955), certiorari denied 352 U.S. 829 (1956), a case dealing with a pipeline's own gas production. On review of these rate increase dismissals the Court of Appeals for the Fifth Circuit

agreed that the evidence as to field prices coupled with opinion testimony as to the need for an incentive price to induce adequate exploratory and development activity was not enough to demonstrate the rates were just and reasonable but held the Commission should have given the producers further opportunity to present evidence. The Court also indicated that the Commission need not require conventional rate base evidence if other cost evidence was available to insure that consumers were not paying more than a just and reasonable price, and need not fix separate rates for each producer if it found a uniform rate for the field desirable.[9]

The area concept also had its origin in proceedings under Section 7 of the Act upon applications for certificates of public convenience and necessity by gas producers. As early as November 28, 1955, in *Cities Service Gas Co., et al.*, 14 FPC 134 (1955), affirmed as *Signal Oil & Gas Co.*, v. *F.P.C.*, 238 F. 2d 771 (CA3, 1956), certiorari denied 353 U.S. 923 (1957), the Commission conditioned a producer certificate to the price level prevalent in the area (14 FPC at pp. 147-148). In some later cases the Commission failed to impose a condition on the initial price, the important example being the CATCO case,[10] relating to the offshore Louisiana area. As a result the Commission was reversed by the Supreme Court, which held that the Commission must impose a condition when the price was "out of line" in the area of production.[11] The area price concept was further developed in other cases remanding Commission orders granting unconditioned certificates.[12]

In the 1956-1959 period, a number of producer cases were initiated as investigations under Section 5(a) of the Gas Act. The first major case to reach the Commission

on the merits was the original *Phillips* case,[13] on remand from the Supreme Court. The Permian case is a direct outgrowth of *Phillips*. In that case the Commission first considered the numerous questions relating to Phillips' cost-of-service, including the difficult allocation of costs between Phillips' oil production and its gas production. While utilizing individual company cost-of-service to pass upon a limited number of increased rate filings, the Commission concluded that such an approach was not appropriate for fixing just and reasonable producer rates for the future. Accordingly, the Commission refused to fix Phillips' rates for the future on this basis. The Commission spelled out in detail the many reasons why the individual company cost-of-service approach did not offer a reasonable basis for determining the just and reasonable prices for sales of gas by producers in interstate commerce. It also pointed out that the administrative burdens of literally thousands of separate proceedings in itself demonstrated the complete infeasibility of attempting to achieve effective regulation on an individual company basis.

On the same day, September 28, 1960, that it issued its *Phillips* opinion the Commission issued its Statement of General Policy No. 61-1 (24 FPC 818 (1960), initiating the area rate approach by establishing guideline ceiling prices for the various producing areas. Separate levels were listed by the Commission for the initial prices at which it would certificate new sales of

---

[13] *Phillips Petroleum Co.*, 24 FPC 537 (1960).

gas and for accepting without suspension price increases under existing rate schedules.

The Commission in prescribing guideline prices attempted to take into account all of the relevant information available to the Commission at the time. These

guideline prices did not purport to be the just and reasonable rates, but rather the interim guides the Commission would follow in issuing certificates and in deciding whether to suspend rate increases until just and reasonable rates could be determined after hearing in area rate proceedings. As a result of the guidline price policy, in a practical sense the area rate approach has been in effect on an interim basis for the past 4 years.

On review, the *Phillips* opinion was affirmed by the Court of Appeals and by the Supreme Court.[14] The courts upheld the Commission in going forward with the area method of regulation. The Supreme Court said (p. 310):

> We respect the Commission's considered judgment, backed by sound and persuasive reasoning, that the individual company cost-of-service method is not a feasible or suitable one for regulating the rates of independent producers. We share the Com-

mission's hopes that the area approach may prove to be the ultimate solution.

The Commission has proceeded with its program to implement the area rate approach. In addition to the present proceeding, AR61-1, for the Permian Basin, a proceeding was begun on May 10, 1961, to determine area rates for the Southern Louisiana area, AR61-2, 25 FPC 942 (1961), and on November 27, 1963, area rate proceedings were instituted for the Hugoton-Anadarko Area, AR64-1, and for the Texas Gulf Coast Area, AR64-2, 30 FPC 1354 (1963). These four proceedings, which are all under way, have as their purpose the fixing of just and reasonable rates for about 75 percent of the gas flowing in interstate commerce.

LEGAL BASIS FOR AREA RATES

In the second *Phillips* case (*Wisconsin* v. *F.P.C.*, 373 U.S. 294 (1963)) the Supreme Court, in holding that the Commission had not abused its discretion by rejecting the individual company approach, stated (pp. 308-309):

> * * * If we believed that such a departure from present concepts had little, if any, chance of being sustained, we would be hard pressed to say that the Commission had not abused its discretion in terminating this §5(a) proceeding while undertaking the area experiment. For if area regulation were

almost sure to fail, and if the individual company cost-of-service method of determining the reasonableness of rates had been abandoned, then there would be virtually no foreseeable prospect of effective regulation.* * *

But to declare that a particular method of rate regulation is so sanctified as to make it highly unlikely that any other method could be sustained would be wholly out of keeping with this Court's consistent and clearly articulated approach to the question of the Commission's powers to regulate rates * * *.

More specifically, the Court has never held that the individual company cost-of-service method is a *sine qua non* of natural gas regulation.

A number of producers contend nevertheless that we are pursuing an inherently illegal method of regulating the field price of natural gas. Sun, in particular, has been vigorous in asserting that the Natural Gas Act precludes us from fixing maximum area prices at a level lower than a producer could justify on an individual cost-of-service basis.

277,578

— 12 —

Sections 4 and 5(a) of the Natural Gas Act provide the authority for regulating the rates of the producers upon which the area rate order is based, but the breadth of the statutory scheme is evidenced also by the other

provisions of the Act which confer broad regulatory authority over sales for resale by gas producers in interstate commerce. For example, Section 7 of the Act requires every producer to obtain a certificate of public convenience and necessity prior to commencing any interstate sale and also requires Commission approval before abandonment of any gas which has been dedicated to the interstate market. Section 16 of the Act empowers the Commission "to perform any and all acts and to prescribe, issue, make, amend and rescind such orders, rules and regulations as it may find necessary or appropriate to carry out the provisions of this Act."

This area rate proceeding includes numerous individual rate increase filings in the Permian Basin which have been suspended. The rates specified in the filings have been collected subject to refund under the provisions of Section 4 of the Act, requiring that all rates shall be "just and reasonable." The area rate order will also apply under Section 5(a) of the Act to those sales of the respondents in the Permian Basin which are not being collected subject to refund. Section 5(a) contains the statutory standard for fixing the future rates for the sales in the area since its provisions are also applicable to rates fixed under Section 4. Section 5(a) provides that:

> Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or

collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and

reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: PROVIDED, HOWEVER, That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural-gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural-gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

While Section 4 of the Act prescribes that "all rates and charges" by *any* natural gas company shall be "just and reasonable", there is nothing in the Act which states or suggests that the justness and reasonableness of a particular company's rates cannot be determined on a group or area basis, rather than in a separate proceeding for

each company. Operating under a statute with virtually the same rate-making provisions as the Natural Gas Act, the Secretary of Agriculture, with the approval of the United States Supreme Court, has long fixed maximum just and reasonable rates for all stockyard marketing agencies of a particular yard, based on stockyard-wide data, rather than individual rates based on the costs of individual agencies. See *Tagg Bros.* v. *United States,* 280 U.S. 420 (1930); *Acker* v. *United States,* 298 U.S. 426 (1936); *United States* v. *Corrick,* 298 U.S. 435 (1936). The Federal Communications Commission, also operating under similar statutory commands, has for a number of years fixed the maximum just and reasonable rates for the competing international telegraph common carriers on a "bell-wether" basis, refusing, in the interests of its statutory mandate of providing the public with "adequate facilities at reasonable charges" (47 U.S.C. 151), to fix the rates "so that all carriers engaged therein may earn a fair return on the fair value of their property devoted to that service or even make some profit on their operations." *Postal Telegraph-Cable Co., et al.,* 5 FCC 524, 527 (1938). See also *The Western Union Telegraph Co.,* 25 FCC 535, 577-580 (1958).

Another example is action fixing a uniform price for milk in a milkshed, a form of regulation which was upheld in the landmark case of *Nebbia* v. *New York,* 291 U.S. 502 (1934). See *United States* v. *Rock Royal Co-op.,*

307 U.S. 533 (1939) (upholding Federal milk marketing orders under the Agricultural Marketing Agreement Act of 1937, 50 Stat. 246); *Sunshine Anthracite Coal Co.* v. *Adkins,* 310 U.S. 381 (1940) (upholding Bituminous Coal Act of 1937, 49 Stat. 991, authorizing Bituminous Coal Commission to impose maximum and minimum prices on an area basis). For the regulation of railroad charges the Interstate Commerce Commission has employed territorial classifications and group rates. *New York* v. *United States,* 331 U.S. 284 (1947); see also *Ayrshire Collieries Corp.* v. *United States,* 335 U.S. 573 (1949).

It is thus well established that governmental price regulation of services and commodities can be lawfully exercised over industries providing commodities or services on a group or geographical area basis. Many different regulating authorities with jurisdiction over an entire industry or common group have been upheld in exercising their rate-making authority on a group basis rather than conducting separate proceedings for each individual company. Moreover, with special reference to rate regulation under the Natural Gas Act, the Supreme Court has long held that neither the Constitution (see *F.P.C.* v. *Natural Gas Pipeline Co.,* 315 U.S. 575, 586 (1942)) nor the Act itself imposes any special "formula by which the 'just and reasonable rate' is to be determined." *F.P.C.* v. *Hope Natural Gas Co.,* 320 U.S. 591, 600 (1944). See also *Colorado Interstate Gas Co.* v. *F.P.C.,* 324 U.S. 581 (1945).

The argument to the contrary stems primarily from a brief dictum in *Bowles* v. *Willingham*, 321 U.S. 503 (1944) in which the Court, in the course of upholding the lawfulness of war-time rent control legislation authorizing the Price Administration to fix, without advance hearing, maximum rents that were "generally fair and

equitable", referred to the then recent *Hope* case for the proposition that "under other price-fixing statutes such as the Natural Gas Act * * * Congress has provided for the fixing of rates which are just and reasonable in their application to particular persons or companies" (*id.* at 517). It is significant that this statement predates the first *Phillips* case and its determination of the existence of Commission authority over producer rates. At the time of the Court's statement in the *Bowles* case, the Commission had not yet undertaken a program for producer regulation and was, as it still is, regulating pipelines under individual company cost-of-service procedures. The Court's dictum contrasting group regulation under the rent control statute with the individual company regulation of pipelines cannot be interpreted to suggest that the latter would be the sole appropriate method of determining rates under the Act for producers whose business involves entirely different economic and administrative problems. On the contrary, the Court went on to state that "considerations of feasibility and practicality are certainly germane to the constitutional issue [of group

versus individual company pricing]" (*id.*), that *Hope* had indicated that "price control, the same as other forms of regulation, may reduce the value of the property regulated" (*id.*), and that though "high cost operators may be more seriously affected by price control than others * * * it has never been thought that price-fixing, otherwise valid, was improper because it was on a class rather than an individual basis" (*id.* at 518).

Both the constitutional and the statutory questions, in other words, are not to be decided abstractly, but rather in the light of the nature of the specific rate-making problem involved, and of what is required to achieve a sensible result. The necessity for accommodating the system of regulation to the circumstances of the industry being regulated was recognized by the Supreme Court in the *Nebbia* case, *supra,* in which it was held that due process under the Fifth and Fourteenth

Amendments demand only that government regulation "shall not be unreasonable, abritrary or capricious, and that the means selected shall have a real and substantial relation to the object sought to be attained" (P. 525). In the words of the Supreme Court in *Hope, supra,* at p. 602 "Under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling."

We believe the area approach should be adopted because it is well adapted to the economic facts of the

industry and the practical administrative problems of carrying out the primary purpose of the Act, which is to achieve effective price control. We remain of the view, originally set forth in our *Phillips* decision in 1960 (24 FPC at 547), that the area approach will enable us to carry out our ultimate objective of setting prices in all producing areas.

Basic to this determination is the fact that objective cost standards for fixing just and reasonable rates for producer sales can best be developed by examining overall producer experience. An individual producer may find only dry holes or marginal wells on his search for gas may result in finding a huge new gas field. A price fixed by his individual cost experience could thus either be too high for consumers in relation to other available supplies or too low to be fair to the producer, considering his risks. However, on a group basis, costs and rates can be developed which will be fair to all concerned. A uniform ceiling price for the area will provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur.

A uniform area pricing system is adapted to the economics of the natural gas industry. The producer who finds large reserves will achieve greater profits than the producer whose exploration efforts result in dry holes or marginal wells. Likewise, the producer whose enterprise is conducted with efficiency and economy will make

more money than the producer who runs his business poorly. There is a strong incentive in area pricing to prudence and economy which does not exist in individual company cost-plus pricing in an industry where individual cost norms are difficult to determine and apply. True, individual returns will vary greatly, but this is as it should be, provided that profits in the aggregate are at a reasonable level.

The area regulatory pattern thus conforms to the characteristics of an industry which, as much as any, is one where there is scope for greater or lesser reward as dictated by the results of exploratory efforts. The area price will give producers the incentive they need to explore to meet the nation's increasing demand for natural gas and yet give consumers the protection which the Act intended.

An obvious advantage of the area rate approach which is of great importance is that it enables the Commission to determine in a single proceeding rates which would otherwise require hundreds of individual rate cases. It will thus eliminate the administrative bottleneck of company-by-company determinations. As we have noted, the four area proceedings now under way will complete the task for 75 percent of the gas flowing in interstate commerce in the entire nation.

The individual company approach would also result in a wide variety of rates in a single field, and even for

the sales by co-owners from a single well, depending on their varying company-wide costs. Such a system would raise staggering burdens of administration. Administrative feasibility is a vital element in the effectiveness of any method of regulation and our experience dictates that it should be given great weight in assessing the validity of the area approach.

The cases do not support the producers' contention that a just and reasonable rate fixed on the basis of the overall costs and profits of the producers in the area would be constitutionally confiscatory as to any respondent who could support a higher price on an individual company cost-of-service basis. The Supreme Court in *Acker* v. *United States,* 298 U.S. 426 (1936) rejected the argument that the pricing orders of the Secretary of Agriculture, fixed on a group basis under the Packers and Stockyards Act, were confiscatory as to a particular market agency, concluding that "in ascertaining a reasonable unit cost as the basis of a uniform rate the Secretary was not bound to, and indeed he could not, adopt any one [market] agency's costs" (*id.* at 429) and that "regulation cannot be frustrated by a requirement that the rate be made to compensate extravagant or unnecessary costs" (*id.* at 431). See also *Tagg Bros.* v. *United States,* 29 F. 2d 750, affirmed *Tagg Bros. v. United States,* 280 U.S. 420 ("It is not incumbent upon the Secretary to fix the rates so high that all agencies in the business would make money whether they did a substantial business or not."); *Bowles* v. *Willingham, supra;* and *Aetna Insurance Co.* v. *Hyde,* 275 U.S. 440 (1928).

In the *Aetna* case rates of all the stock fire insurance companies doing business in Missouri had been reduced by the superintendent of insurance under a statute authorizing him to limit the rates charged so that the "aggregate collections" by all the companies would not exceed a reasonable rate. The superintendent reduced the rates uniformly and on appeal by the companies involved the Supreme Court concluded that the Fourteenth Amendment was not violated merely because the aggregate collections were not sufficient "to yield a reasonable profit or just compensation to all companies that happen to be engaged in the affected business." (p. 447)

Even in situations where it is appropriate to fix rates on an individual company basis, the courts have held that a company's rates may be fixed at a level below that which would be justified on a normal cost-of-service basis, where the low rates result from self-imposed contractual limitations. (See *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1955)) In an analogous situation, it was early held that a turnpike was not entitled to higher tolls on the basis of cost-of-service evidence where the real problem was the low volume of traffic (Covington & Lexington Turnpike Road Company v. Sandford, 164 U.S. 518 (1896)).

These cases make clear that there is no constitutional infirmity in the statutory authority to fix just and reasonable rates on an area basis, and argue persuasively that

in group ratemaking individual costs cannot be controlling. To hold otherwise would convert a proceeding to control prices into one that merely established a minimum rate above which every producer would be free to justify an above-ceiling rate in an individual company determination. A procedure under which the area rate would become a floor rather than a celing would destroy the area rate concept as an effective means of regulation. Such an approach to our consumer protection responsibilities under the Natural Gas Act would be neither just nor reasonable.

While we will not permit a back-door approach to individual cost-of-service under the guise of avoiding confiscation, there may well be circumstances in which a producer would be entitled to relief from his obligation to continue to render service to the public at the area rate or to make refunds for past periods. Accordingly we shall provide an opportunity for producers to petition

for special relief from the area rate as set forth in detail at pages 104-107. We cannot here visualize all of the circumstances which may serve as the basis for such relief, and will provide adequate flexibility to consider claims to such entitlement, but it is obvious that more must be shown than that the individual producer's costs exceed composite costs.

We believe the record in this case, judged in light of our experience in administering the Natural Gas Act,

clearly supports the conclusion that the area approach offers a regulatory method which is best adapted to the discharge of our responsibilities for protecting natural gas consumers while providing the greatest incentive to producers to continue their search for needed additions to our gas supply.

CONTRACT PRICES AS A BASIS FOR REGULATION

In considering the appropriate guidelines for regulating producer rates on an area basis, we must dispose of one threshold argument. Certain of the producers contend that their contract prices should be approved as meeting statutory requirements because they have been reached as a result of what is termed effective competition. IPAA contends that the examiner erred in not adopting as the standard for determining area prices the "market value" as established by natural gas purchase contracts negotiated at arm's length. A number of other producers propose a slightly more sophisticated version of this argument under which the contract rates negotiated at arm's length would be allowed to govern as long as the ratio of proven reserves to production did not become inordinately high.

We recognize that the history of negotiated prices in the area is an important element to be considered in reaching our decision. However, the producers' contention that the Commission should simply validate their negotiated prices, if accepted, would amount to an abdication of our regulatory responsibility.

The essential difficulty with the contract price argument is that there is nothing in this record which would justify a conclusion that reliance on contract prices unrelated to cost will "afford consumers a complete, permanent and effective bond of protection from excessive

rates and charges", which is the purpose of the Act in prescribing that the rates and charges to consumers of natural gas should be just and reasonable. *Atlantic Refining Co.* v. *Public Service Commission of New York (CATCO)*, 360 U.S. 378, 388 (1959). See *Wisconsin* v. *Federal Power Commission*, 373 U.S. 294, 309-310 (1963). *Phillips Petroleum Co.* v. *Wisconsin*, 347 U.S. 672, 685 (1954). There are admittedly many producers selling gas to the interstate pipelines both in the nation as a whole and the Permian Basin in particular, but nothing in this record suggests that any competition among them in making sales to the pipelines is in any way adequate to assure that the public will secure gas at just and reasonable prices in the absence of regulation.

The history of price negotiations in the Permian Basin area is relevant to this issue. When El Paso was granted a certificate to supply natural gas to the California market on May 31, 1946, 5 FPC 115 (1946), it had entered into contracts with Phillips, Gulf, Shell, and Warren for a supply of gas in the Permian Basin. El Paso was to pay to Phillips 3.5 cents per Mcf, Shell and Warren 3.0 cents,

and Gulf 4.0 cents. These prices were subject to escalation by one cent every few years and to spiral escalation clauses by which they would be adjusted upward if El Paso's resale rates increased at the California border. Later, the spiral escalation clauses were deleted and indefinite favored-nation escalation clauses were substituted, except in the case of Phillips.[15]

In 1953, the Commission certificated Permian Basin Pipeline Company (a subsidiary of Northern Natural, and since merged into it).[16] The initial price amounted to approximately ten cents per Mcf for pipeline quality gas and was subject to escalation of one cent every five years.

In 1959, Transwestern Pipeline Company, 22 FPC 391 (1959), obtained a certificate to build a new pipeline from the Panhandle-Hugoton area of Texas and Oklahoma and from the Permian Basin to California. For the producers supplying gas to the pipeline the Commission authorized 16-cent prices and one 18-cent price, but the contracts called for prices as high as 21.8 cents in the West Texas-Permian area and 23.0 cents in the Panhandle-Hugoton area.

---

[15] A favored-nation clause in a contract generally provides that the contract price shall be increased to equal higher prices paid others in a given area. There are numerous variations of the basic concept. Spiral escalation clauses are also indefinite in amount and provide for increases in producer rates in proportion to increases in the rates of the pipelines that are purchasing the gas from the producer.

[16] *Permian Basin Pipeline Co.*, 12 FPC 85 (1953).

The escalation clauses in the contracts and the urgent pipeline requirements for large volume gas reserves contributed to a continuous rise in Permian Basin prices. As a result of these escalation clauses and the expanding need for gas the 2.8-cent per Mcf average price paid by El Paso in 1947, its first full year of purchases, increased to 9.0 cents in 1954, the year of the first *Phillips* case, and reached 13.8 cents per Mcf in 1960. In that year, El Paso renegotiated most of its Permian contracts to eliminate the indefinite price clauses but was required to agree to price increases. The new prices ranged from 13.5 cents per Mcf to 17 cents per Mcf for gas of high quality.

We do not suggest that this historical pricing pattern in and of itself demonstrates the invalidity of the contract prices now in effect in the Permian Basin. On the contrary, it is obvious that the extremely low prices prevalent during the earlier period of large oil-associated supply and small demand bear no relationship to the cost of exploring for and producing gas even in that period, to say nothing of the present. However, while the record indicates that the costs of the various producers in the field differ markedly, there is no evidence that any significant volumes of gas of similar quality have ever been offered for sale at prices which reflect these cost differences.

The pipelines are far from being in a bargaining position which would validate the theory that a market price

will necessarily be a just and reasonable price. On the contrary the entire history of pipeline purchasing activity, since the end of the El Paso monopoly in the Permian Basin, has been characterized by the overriding needs of the pipelines to contract for the large blocks of uncommitted reserves essential to maintain their competitive position in developing markets (see *United States* v. *El Paso Natural Gas Co.*, 376 U.S. 651 (1964) and their inability to accomplish this objective except at ever increasing prices. The abstention of the pipelines from these proceedings does not indicate that any significant change can be expected in the future. The fact that many pipelines are themselves producers with an interest in generally higher producer prices also cannot be overlooked.

277,589

— 23 —

There is no basis for concluding that there would be any effective producer price competition even if the pipelines were in a position to encourage it actively. On the contrary, until action was taken by this Commission, the entire pattern of producer contracts in Permian was on a basis of favored-nation and spiral escalation contracts calculated to assure that all producers would be treated alike and receive the highest going price both at the time of the contract and in the future. Typically, where a large producer has been able to command a higher price for a big block of gas needed by a pipeline entering the market or preparing for a major expansion,

this has had the effect of raising the price to all other purchasers by all other sellers big and small, and regardless of their costs or profit ratios. Moreover it is obvious that a key factual question in determining whether there is effective competition is the amount of uncommitted reserves controlled by the large producers. The pattern of sales and annual deliveries in the Permian Basin strongly suggests that a limited number of producers control a large percentage of the gas reserves,[17] and it is significant that the producers in the exclusive possession of the facts have made no showing to rebut this conclusion.

In *United Gas Improvement Co.* v. *F.P.C.*, 290 F.2d 133, 135 (CA5, 1961), certiorari denied 368 U.S. 823 (1961), it was said that the supply of gas controlled by the producers is so restricted in relation to demand that they have economic power to bargain for prices that will be injurious to the public. The Court held that the Commission in exercising its authority may not act merely upon proof that the prices in question were arrived at as a result of arm's-length negotiation, but must look behind the negotiated price. See also *P.S.C. of New York* v. *F.P.C.*, 287 F.2d 146 (CADC, 1961), *United Gas Improvement Co.* v. *F.P.C.*, 287 F.2d 159 (CA10, 1960). In so holding the court was reiterating the position it had taken in a series of cases involving just and reasonable

[17] The record reveals that 5 producers account for about one-half of the jurisdictional sales in the Permian Basin and 15 producers make about three-fourths of all the sales of gas in the area.

rates for independent producers under Section 4 of the Act in which it had concluded that:

> * * * evidence of unregulated prices in the field is not sufficient to warrant a finding by the Commission that a price comparable to them is just and reasonable within the

> intendment of the Natural Gas Act. Neither is evidence of the field price when coupled with the opinion of experts that the price must be high enough to provide an incentive for exploration and development of new sources of supply."[18]

If there is a case to be made for effective competition among producers in establishing just and reasonable rates it has not been made on this record. There is no evidence of competition between producers to make new sales by offering lower prices. On the contrary, the primary competition revealed by the record was among the pipelines to secure new gas supplies at higher prices. Whatever the

---

[18] *Bel Oil Corp.* v. *F.P.C.*, 255 F. 2d 548, 553 (CA5, 1958) certiorari denied, 358 U.S. 804. See *Forest Oil Corp.* v. *F.P.C.*, 263 F. 2d 622 (CA5, 1959); cf. *City of Detroit, supra.* As the court indicated in the *Bel Oil* case the expert testimony purported to show that petitioners "did not possess any dominating position in the industry, that natural gas is competitive with other non-regulated fuels, that the proposed prices were comparable with unregulated prices for local consumption; that maintenance of such a price is necessary to provide appropriate incentives for exploration and production of natural gas in Louisiana." (p. 551)

degree of competition which may exist among producers it has not been effective to afford gas consumers the protection to which they are entitled under the Natural Gas Act. Under these circumstances, there is no basis for assuming that prices which "have leaped from one plateau to the higher levels of another" will constitute a level which will be "the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest." *Catco, supra,* at pages 391, 388.[19]

It is thus clear that our examination of the contract prices of the gas producers is only the beginning and not the end of our task in establishing the proper criteria for determining just and reasonable rates.

277,591

— 25 —

RESERVES TO PRODUCTION RATIO AS A REGULATORY STANDARD

The producers contend that the gas supply situation is so critical that any significant limitation on contract prices would necessarily result in a dampening of essential exploration and development activity. In major part this argument resolves around the controversy as to the declining reserves to production ratio (R/P ratio) in the gas industry. This ratio has been as high as 32.5 to 1 in

[19] As the Supreme Court pointed out in the *Catco* case, *supra* (at p. 388, footnote 7), this "declaration of which stems from the original version of Section 7 of the Act, was not intended to be changed by the 1942 amendment to the Act, which omitted that provision.

1946 and it has steadily declined to about 18.7 to 1 in 1963, based upon the reserve figures provided by the American Gas Association and the American Petroleum Institute.[20]

The producers suggest that the reserves to production ratio should be the barometer by which the Commission is guided in setting any limitations upon the producers' contract prices and specifically that no such limitation should be imposed if the R/P ratio is not at least 20 to 1. Alternatively, they argue that, even if the Commission were to adopt the 17.5 to 1 ratio which the examiner believed was a reasonable target for 1970, present trends indicate that a lower ratio will be reached by that date; and they argue further that fixing area ceilings below existing contract prices would act as a brake on producer investment in gas exploration and development, and would therefore be contrary to the public interest.

In evaluating the producers' argument we must first analyze the forces which have determined the overall level of exploration and development by producers in the Permian basin and elsewhere. The overwhelming fact which emerges from this record is that the vast increase in exploration and development of gas supplies which has taken place in the last two decades has resulted from the development of a system of interstate pipelines which has created an ever increasing nationwide market for gas. In short, the producers have stepped up their

---

[20] The 1964 statistics available after the record was closed revise the R/P ratio for 1963 to 19.0 to 1 and reveal that the ratio in 1964 was 18.3 to 1.

exploration and development activity because a market had been created for their product, even though during most of this period the prices have been far lower than fully allocated costs as determined herein.

277,592

— 26 —

We agree with the examiner that the emergence of directionality, *i.e.*, the ability of producers to direct their drilling activities toward either oil or gas, brings into being for the first time an opportunity for price to play a significant role in increasing the supply of gas-well gas available to the interstate market. We have reflected this fact in the system of ceiling prices which we are adopting because, in our opinion, the true benefits of directionality can be best achieved through a two-price system which, though based on costs, by its very nature provides a special inducement for exploration for gas-well gas. Such a system should permit price to play its full role in eliciting needed gas supplies. To permit still higher prices would only create windfalls for the producers with no assurance of any concomitant consumer benefits.

We agree that a strong exploration program which will discover and develop gas reserves in ample time to meet the increasing demands of gas is vital. Any method of fixing just and reasonable prices must take this into account. However, there is no reason to assume that there is a direct relationship between any calculated R/P ratio and the price of gas. On the contrary, the R/P ratio went steadily down during the periods in

which gas prices were staging their most spectacular increases. It seems clear that even an exploratory program which will continue to add substantially more reserves annually than are produced is almost certain to fall short of preventing a further decline in R/P ratios.

As long ago as 1957, the AGA in *Gas Facts*, 1957 edition, page 6, stated that the industry should not be preoccupied with a "hypothetical" reserves to production ratio, but should focus its concern on finding sufficient gas to replace that consumed each year. There is considerable doubt that it is desirable, from the point of view of the public or the industry, to require or encourage a high level of proven reserves many years in advance of their probable use. It is an extremely costly matter to find and hold reserves beyond those which are needed to

assure ample supplies to consumers. The Commission's recent action in allowing exceptions to the 12-year minimum deliverability rule was a limited step in recognition of this fact.[21]

---

[21] Order No. 279, 18 C.F.R. 2.61, 260.7; issued March 31, 1964, prescribing the filing of annual reports by pipelines to furnish information with respect to total gas supply and deliverability stated, "* * * information from the reports will make it possible to relax the Commission's 12-year deliverability life requirement where the information supplied by the pipeline company indicates it has an active procurement program, its system extends into production areas with continuous exploration and the results thereof indicate continuing ability to meet gas requirements."

There is also serious question as to the reliance to be placed on the available R/P ratio figures. The proven reserve figures are admittedly conservative. The amount of proven gas reserves added each year depends more upon revisions of former reserve estimates which have varied widely than upon new findings. The true ratio of reserves to production is undoubtedly higher at the present time than would appear from available statistics.

For all these reasons, we believe it would be doubtful wisdom for this Commission to attempt here to fix the minimum appropriate level of reserves for the industry, and particularly we think that it would be unwise as well as futile for us to attempt to gear our pricing policies towards maintaining a reserves to production ratio of 17.5 to 1 or higher. The ratio has already declined very close to that point, and it will probably decline further regardless of the price of gas set by this Commission. Such a decline is the inevitable result of increases in consumption on the scale that we have witnessed in the past decade. Under these circumstances, any attempt to maintain a specific ratio of reserves to production by permitting interstate prices to reach their maximum contract level would be much more likely to affect adversely the market for gas than to induce substantially greater supplies.

The impracticability for the long term of attempting to maintain indefinitely a 17.5 to 1 ratio may be demonstrated by some simple figures. It is estimated that by 1980 natural gas use, already more than 15 trillion cubic feet a year, will have grown to 25 or more trillion and by

the year 2,000 annual use can be expected to exceed 30 trillion. This level of use at the specified ratio would require reserves of 525 trillion cubic feet. By that date we shall have used some 900 trillion cubic feet of gas now in the ground, which would mean a total of some 1400 trillion cubic feet would have been found. This is in the middle of the range of responsible estimates of the total gas found and to be found in the United States.

That the reserves ratio will decline is not necessarily a cause for concern for many years to come. The high ratios of the past were not a result of design or of business prudence, but resulted rather from lack of a market for the immense reserves discovered in the search for oil. In such circumstances the imposing reserve ratios of the past have little significance. With the intensive post-war development of the natural gas market we are witnessing an adjustment of the reserve ratio to economic levels.

While the adequacy of reserves is an important factor in our determination here, and will continue to be an important factor in reviewing area rates in the future, we cannot accept the producers' position that the maintenance of a particular R/P ratio justifies the existing and future contract prices, whatever they may be.

THE TWO-PRICE SYSTEM

The presiding examiner at pages 12-38 of his opinion presents a persuasive discussion of the "Economic and

Institutional Factors Which Govern the Method of Establishing Area Rates."

The touchstone of the presiding examiner's decision is his conclusion that the industry is increasingly becoming able to direct its exploration efforts toward finding new gas-well gas as distinguished from finding gas as a by-product in the search for oil. This newly documented ability of the industry to channel its exploration investment toward either gas or oil serves as the basis for a pricing system, which we here adopt, that will make use of the economic drive of the industry in order to bring needed gas supplies to consumers at the lowest reasonable price.

The Commission's staff and some of the interveners argue that even if some companies can effectively direct their exploratory activities toward gas, it has not been shown that all of the Permian Basin producers can do so. In making this argument special reliance is placed upon testimony to the effect that small producers do not have the resources necessary for effective directional exploration.

277,595

— 29 —

We have considered the evidence presented and we conclude, as did the examiner, that the larger producers in the industry have shown an increasing ability to direct their drilling activities toward either gas or oil, as they desire. Large producers maintain geological staffs and extensive files of geological information upon which the

necessary predictions can be based. While small producers, may lack the capital to maintain the organizations necessary for effective prediction, they often drill on lands obtained on farmouts from larger producers and thereby obtain the benefit of the geological knowledge required for directional drilling. To this extent it appears that even small producers are often able to drill with some assurance as to what they may expect to find.

In agreeing with the examiner's finding on directional drilling we do not mean to suggest that all exploration and development activity by producers is based upon reliable predictions as to what if anything will be found. What we do say is that on this record a major portion of the industry operating in the Permian Basin in recent years has demonstrated the ability by directional drilling to increase the known supply of gas, provided that the regulated price and the demand for gas justifies such an investment. Looking to the future we are establishing a pricing system that will encourage the industry to expand and perfect its ability to drill directionally so that revenues from gas consumers can increasingly be devoted to finding additional gas reserves.

In referring to the incentive provided by the ceiling for "new" gas-well gas we are not providing any special, isolated amount as a separately designated incentive. The inducement to be found in the "new" gas price is of an inherent nature and is not represented by any sum ear-marked for that purpose. The incentive is built into the two-price system. It provides a price for the future related to current and future costs and payable only to

producers who discover gas-well gas and dedicate their discoveries to the interstate market.

A single price based on an average of historical and current costs could not provide the same incentive to explore for gas in the future even if it yielded the same

revenue. A single price based on future costs will result in windfalls to those producers who acquired and sold gas under lower cost conditions. The two-price system thus holds out a reward to encourage producers to engage in further exploration and development while preventing excess and unnecessary revenues from the sale of gas developed at a period when there was no special exploratory activity directed to gas discovery.

The producers favor a single price and the arguments they make are aimed at obtaining the "new" gas price as the one price to be applied to all gas. We disagree. If a one-price system were to be adopted, average historical costs — not the higher current costs — would necessarily serve as its foundation, and we have no assurance that such a price would elicit the investments at current cost levels which are needed to bring forth adequate new supplies of gas-well gas.

The producers support a contention for a single price based on current costs with the argument that current revenues provide financial support for current exploration and development. Assuming *arguendo* the factual

basis for the argument, this is not an acceptable reason for "flowing gas"[22] being the beneficiary of "new" gas-well gas prices. The producers' inducement to engage in further exploration and development directed toward gas comes from the knowledge that future gas supplies will receive a price which provides adequate compensation. Of course the availability of funds to seek new sources of supply is a factor to be considered in the fixing of all prices, and we have not overlooked this factor in the determination of the "flowing" gas price. It does not follow that a single price for all gas is required. On the contrary, as already stated, if such a ceiling were fixed high enough to elicit new gas-well gas supplies it would result in windfall profits for all other gas and if fixed low enough to reflect costs for old gas it would not assure adequate supplies for the future.

277,597

— 31 —

The record in this case was augmented by the econometric studies introduced by the staff and a rebuttal showing by the producers. These studies are, as the examiner stated, truly pioneering endeavors. The studies were not designed to support a specific rate recommendation or rate design but served to focus attention upon the important role of market demand among the considerations relevant to our decisions. The studies indicate that ad-

---

[22] The term "flowing gas" in this opinion will be used to include old gas-well gas, oil-well gas and residue gas as explained in detail at pages 78-80, *infra*.

vanced statistical and mathematical techniques can be useful in understanding the interaction of the price of gas at the wellhead and the demand in the marketplace.

The econometric studies in this case were based on the assumption of a one-price system and as noted by the examiner, "on a non-directional hypothesis." The quantitative results of the studies therefore cannot be relied upon in this case although the studies tend to support our conclusion that a two-price system is necessary and desirable to make positive use of the interaction of price and gas supply.

It has been suggested that providing a separate ceiling for new gas-well gas may retard the search for gas by inhibiting demand, on the theory that high prices may price gas out of some markets. This argument may have some merit as an abstract proposition but it misses the mark when applied to the facts of this case. We are not here fixing a ceiling that will increase prices but rather one to reduce unreasonably high prices and stabilize field prices generally. Furthermore while fixing a higher ceiling for new gas-well gas (including residue gas derived therefrom) we are also fixing a lower ceiling for all other gas. Certainly the ceiling prices fixed herein which will stabilize gas prices that have been increasing in the past cannot be a basis for predicting a declining market.

Some who opposed the examiner's price structure also argue that no need to encourage a stepped-up search for additional reserves at this time has been shown. It is pointed out that on a nationwide basis the AGA figures on proven reserves show that more gas has been found each

year than was consumed, even though the reserve ratio as computed by AGA has been declining. It is also argued that we must take into account increasing discoveries of gas in Canada and Mexico as well as the possibility that technology may make new sources of energy available to supplement gas long before present reserves are exhausted.

It is beyond dispute that continuing exploration and development of new gas reserves is necessary in the public interest. The only question is the proper scale of the necessary effort. In the absence of a regulatory pattern which offers encouragement for the search for gas there is no guarantee that the present generally satisfactory pace of exploration will continue, much less increase to meet growing demands. New gas discoveries are the lifeblood of the industry and are also essential to consumers who are tied to natural gas. This Commission cannot discharge its responsibilities to the public by relying on unsupported suggestions that gas supplies from distant sources or other forms of energy will suffice to meet an obvious need for new gas supplies to serve the needs of the pipelines and of their consumers who are tied to the use of this fuel by large investments in gas utilization equipment.

In the past the greater part of the gas in the Permian Basin was found in the course of searching for oil but, as the examiner found, in recent years there has been a decline in drilling for oil. The future needs of the gas

market can no longer be satisfied by the incidental discoveries in the search for oil. Accordingly, there will be a greater dependence on exploring for gas wells to bring forth needed gas supplies in the future and this fact supports our conclusion to fix a higher ceiling for new gas-well gas which will encourage exploration at deeper horizons directed toward finding gas.

The separate price we fix herein for new gas-well gas in the Permian Basin should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies. In order to assure that every effort

will be made by producers to bring in new gas-well gas we also state our conviction that the ceiling set in this proceeding should continue to apply to all such new gas dedicated within the ceiling fixed herein even if in any later review of the area rate for the Permian Basin the evidence indicates that a lower price would be justified for future discoveries. We cannot bind the Commission for the future, but we state our view that any lower ceiling should apply only to new gas dedicated after the ceiling price may have been subsequently reduced.

On the basis of the record made in this proceeding and after careful consideration of the arguments against the examiner's findings on these points we conclude that there is substantial support for pricing new gas-well gas at a higher level in order to encourage the search for new gas reserves at minimum overall cost to consumers.

THE DATE OF DIVISION BETWEEN NEW GAS-WELL GAS AND OLD GAS-WELL GAS

The presiding examiner fixed December 23, 1960, the date this proceeding was initiated, as the date dividing new gas-well gas from old gas-well gas. Gas moving under contracts filed with the Commission before December 23, 1960, would be classified as old gas; gas moving under contracts filed on or after that date would be new gas. Staff has advocated a division date of January 1, 1961, which would offer the administrative convenience of making the division at the beginning of the calendar year. The California Distributors urge that the new gas price should be effective only as to gas moving under contracts filed after the conclusion of this proceeding. They argue that any incentive element included in a higher price for new gas can fulfill its purpose only with respect to gas dedicated to interstate commerce after the conclusion of this proceeding. The Major Producer Group, on the other hand, would apply the new gas price to all gas moving under contracts dated after June 7, 1954, the date when regulation of natural gas producers commenced.

The argument that a two-price system should have a 1954 breaking date is weak. The essential justification for the dual price system is that with the recent development of directionality there is for the first time a basis for believing that gas exploration and development activi-

ties may be responsive to price. To apply a price based upon the present cost of finding and developing gas-well gas to such gas (to say nothing of casinghead and residue gas derived therefrom) developed before the era of directionality would be inconsistent with the rationale of our decision and bestow a windfall on the producers.

There is more plausibility to intervener's argument that the cut-off date between new gas and old gas should be the effective date of this decision. We agree with the examiner, however, that the proper breaking point should be at or near the end of 1960. As indicated *infra,* our price for flowing gas including old gas-well gas is being fixed primarily on the historical cost-of-service for this case as derived from the respondents' cost data supplied in response to the Commission inquiry. The test year for such data is 1960. Moreover, while the new gas-well gas ceiling is based on current rather than historical costs, the record indicates that directionality upon which the two-price system is based first became significant about 1960, and that costs have remained constant since that time.

There is another reason why we believe that a date approximating that fixed by the examiner is in the public interest. In effect, the two-price system which we have now prescribed was established for Permian and many other pricing areas in the adoption of our dual guideline ceilings by the September 28, 1960, Statement of Policy. Our pricing policy has given different treatment to gas dedicated since that date than to older gas. The expectations of producers which would presumably result from

this policy of the Commission are thus consistent with the cost of considerations referred to above.

277,601

— 35 —

The specific date for distinguishing between old and new gas-well gas presents, we believe, primarily an administrative problem. The examiner suggested December 23, 1960, the date of the institution of the Permian proceeding, but this would imply that the old gas/new gas breaking point in the various areas should depend upon when the particular area case was initiated — a date which has no necessary relationship to any of the considerations referred to above. It has been suggested that the September 28, 1960, date on which we issued the Phillips decision and the statement of policy should be utilized. However, our decision therein could hardly have had any such instant effect upon contract negotiations, to say, nothing of the effect upon exploratory activity. Moreover, using September 28, 1960, as the dividing point would mean that some of the gas sold in the test year and used for determining old gas mixes would receive new gas treatment. We think that, all things considered, it would make more sense to set the dividing line as of the end of the 1960 test year. Accordingly, the new gas ceiling will be made effective for contracts entered into on or after January 1, 1961.

(277,601)

BASIC STANDARD FOR NEW GAS-WELL GAS CEILING PRICE

It becomes necessary at this point to define gas-well gas with more particularity. By gas-well gas we mean so-called nonassociated gas, that is, gas from dry gas reservoirs and gas condensate reservoirs, and gas from gas-cap wells.[23] Within these definitions the classification of gas wells by the appropriate state agency will be accepted for purposes of this decision in the absence of a showing that it is not a reasonable classification for pricing purposes. The definition of all other gas will be discussed *infra* at pages 70 and 75.

277,602

— 36 —

Except for those parties who advocate existing contract prices as the primary regulatory standard, all parties recognize that costs must be a major factor in determining the area price. If the area rate approach is to rest on a solid foundation there must be an objective test by which the industry, the consumers and the courts can appraise the fairness of the price we fix. We are convinced that a composite cost determination is the bedrock on which a regulated price must be established. The issue

---

[23] Gas-cap gas is a special category of gas from an oil reservoir that can be produced free from the influence of oil production. As a practical matter state classification of the small amount of gas in this category in the Permian Basin makes it reasonable to include gas-cap gas in the category of gas-well gas. If production of gas-cap is governed by allowables set for oil by the state agency, it will not be considered gas-well gas.

is thus narrowed to one of the weight to be given cost evidence and the particular cost-finding technique we are here to adopt.

The Supreme Court in the second *Phillips* case, in upholding the Commission's abandonment of individual company cost-of-service and sanctioning the Commission's efforts to proceed with the area rate approach, observed with approval that the Commission had stated that area rates would be based on the " 'reasonable financial requirements of the industry' in each production area" and that "composite cost of service data will be considered in the area rate proceedings." (376 U.S. at 310)

Accordingly, we conclude that composite cost showing must be the basic ingredient in determining the area rate. This does not mean that other factors should not be considered. The Commission must exercise its judgment and determine a rate in light of all the evidence in the record. For one thing, the rate must be one that the evidence indicates will elicit a level of exploration activity adequate to provide the increased gas supplies required by consumers in the future. There is also a need to exercise judgment in the design of the rates to avoid unnecessarily sharp and abrupt departures from existing pricing patterns and the business and community dislocations which could result. Of course, in fixing the rate of return, a key element in the cost of determination, the Commission has wide discretion to consider these factors, so that to a considerable degree they can be accommodated within the framework of composite cost pricing. Nevertheless,

we make clear that we do not confine ourselves to a cost calculation in determining just and reasonable rates.

277,603

— 37 —

Basic to our determination of the guidelines for the price of new gas-well gas is the selection of the method of cost finding to be adopted. We shall discuss later in this opinion the cost basis for all other gas but it may be helpful here to say that we shall use the cost of gas-well gas as the yardstick for all prices we fix in this proceeding. We do so for two reasons. First, the record reveals that casinghead gas and other associated gas are found largely as a by-product of the search for oil. Historically, casinghead gas has not been priced on a cost basis and any cost-finding technique is unrealistic which assigns large sums for exploration and development to casinghead gas. A second and related reason is that gas-well gas costs are much more meaningful because they are far less dependent upon allocations between gas and oil than are the costs of casinghead and other associated gas.

The parties suggested three basically different methods for determining the cost of new gas-well gas. The main producer presentation is an estimate of the cost of financing new supplies of gas-well gas on an industry basis in which all exploration and development (E&D) expenses are capitalized and a discount rate of return utilized. The California Distributors also presented a gas-well gas cost study based on published national statistics and the answers by respondent producers to

the Commission's cost questionnaire but instead of capitalizing E&D cost, expensed them, and utilized a conventional rate of return. Both methods provide a nationwide cost for gas-well gas keyed to the cost of finding and producing new gas supplies. The third cost approach, presented by the Commission's staff, is a composite presentation patterned after the individual company cost-of-service approach in which there is determined the historical cost per Mcf of gas-well gas production. The staff also presented a similar composite presentation limited to Permian Basin area costs.

277,604

—38—

A preliminary question in determining the methodology of cost finding is whether costs are to be determined on an area or a national basis. As the examiner pointed out, the question is not whether a national price should be established but whether national or area costs should be used as the basic standard for fixing the future price of new gas-well gas in the Permian Basin. All parties agree that exploration and development operations are conducted by the industry on a national basis because it is impossible to isolate E&D by areas. Without adopting all of the reasons advanced by the examiner at pages 40 and 41 of his opinion we agree with the conclusion that the cost of new gas-well gas should be determined on a national basis. Perhaps most persuasive is the fact that we are fixing a price based upon current cost of finding an Mcf of gas and that much, if not most, of the rele-

vant information is available only on a national basis. It may be that in some areas production costs may vary sufficiently from the national average to warrant a different treatment but on the record in this case we agree that cost of new gas-well gas should be determined on the basis of nationwide data.

The examiner adopted, with modifications, the cost presentation of the California Distributors. We agree with the examiner that in determining a ceiling for new gas-well gas which is to serve as an incentive to search for additional gas the preferable approach is the one that is geared to the recent cost of finding and producing an Mcf of gas rather than the historical cost based on production volumes. Historical costs will not necessarily reflect current realities.

A price based on the current cost of finding and producing an Mcf of gas-well gas, on the other hand, should provide the economic incentives to find and sell gas under prevailing conditions at rates which are keyed to industry needs and at the same time protect the interest of consumers.

277,605

—39—

We believe that the method of costing we have adopted in this proceeding is required on the basis of the record before use and that it provides a sound basis for our decision. We emphasize, however, that our conclusions herein should not be construed as necessarily constituting the final solution of this intricate problem. Other methods

of estimating the new gas cost may be given further consideration in succeeding cases if adequately supported.

THE COST OF NEW GAS-WELL GAS

We shall now proceed with an examination of the presiding examiner's determination of the cost of new gas, and of the exceptions thereto, in our determination of the area price ceiling of new gas-well gas.

A word of explanation is in order as to the variety of data sources utilized for determining the cost of gas in this proceeding. The natural gas producers, unlike electric power companies and natural gas pipelines, have not as yet been required to conform their books to a uniform system of accounts. The petroleum producers typically do not reveal their cost experience or accounting treatment in depth. When this proceeding was initiated there were no statistics available based on a uniform set of accounts to provide the necessary information for making the cost determinations in this proceeding. The cost questionnaire promulgated by the Commission was designed to fill this information gap in part and the responses have supplied a vital source of information for determining costs in this proceeding. In addition Census data and other well-recognized and authoritative industry data sources were utilized by various witnesses in the proceeding. The record is thus built upon a variety of sources which we believe in combination provide an adequate basis for the costs we have found.

The presiding examiner found that the national average cost of an Mcf of new gas-well gas was 16.88 cents. His

computation and our modifications thereof may be summarized as follows:

	Cost in Cents per Mcf	
	Examiner	Commission
Exploration and Development Costs		
Dry Holes	1.42	1.42
Other Exploratory Costs	1.59	1.59
Adjustment for Exploration in Excess of Production	1.11	1.11
Production Operating Expense	2.88	2.70
Net Liquid Credit	(2.68)	(3.10)
Regulatory Expense	.14	.14
Depletion, Depreciation, and Amortization of Production Investment Costs		
Successful Well Costs	2.88	2.88
Lease Acquisition Costs	.76	.76
Cost of Other Production Facilities	.31	.31
Return on Production Investment (at 12 percent)	5.21	5.21
Return on Working Capital	.20	.35
Subtotal	13.82	13.37
Royalty at 12½ percent	2.11	2.05
Production Taxes[24]	.95	1.01
Total	16.88	16.43

[24] Texas production taxes of 7 percent have been used in the Commission's computation. New Mexico taxes are lower, and both cost computations and the ceiling price should be reduced accordingly for gas produced in New Mexico. The amount of production taxes does not include taxes on the royalty payments which are chargeable to the royalty owner.

EXPLORATION AND DEVELOPMENT COSTS

Dry Hole Costs

Adopting the California Distributors' presentation, the presiding examiner derived a dry hole cost of 1.42 cents per Mcf principally on the basis of data published by the United States Bureau of Census, Census of Mineral Industries for 1958 (1958 Census), with respect to drilling costs per foot. Since there were no such census costs available for 1960, he established a trend for such costs by comparing 1958 and 1960 cost data obtained, in response to the questionnaire circulated by this Commission, from producers of more than 10 million Mcf annually, producing in the Permian Basin.[25] He then adjusted the 1958 Census figures in accordance with the trend established from the questionnaire data to establish the 1960 costs.

The Major Producer Group objects to the examiner's use of questionnaire data to establish a trend in E&D cost from 1958 to 1960 and adjusting the 1958 Census figures on the basis of the trend established. We think the examiner was correct in determining that the questionnaire data are valid for purposes of establishing a trend in the entire industry. We adopt the reasoning of

[25] The questionnaire data includes costs from a few producers of less than 10,000,000 Mcf annually who also responded to the questionnaire. However, the inclusion of this data does not affect the results.

the initial decision upon this point, and the 1.42 cents per Mcf cost, as set forth in Appendix B, pages 1 and 2.

As we have already noted, other methods of computing dry hole costs were suggested in the record. Of particular interest in the alternative method of cost determination, advocated by the Major Producer Group, often called the project method, which capitalizes the total cash outlays to acquire a capital asset (*i.e.*, project) and allows a return on that investment over its productive life. Under this method, dry hole costs and other costs associated with unproductive ventures would be capitalized along with the cost of productive ventures. We find that this alternative method which would constitute a departure from our treatment of E&D in prior proceedings as well as a deparure from present industry accounting practices is not adequately supported in the record. The inadequacy is especially

notable with respect to the cost of capital for establishing the fair rate of return to be allowed on the computed investment base. However, capitalization of E&D may well be a useful approach and we do not foreclose in succeeding cases further consideration of this alternative method of costing or of improvements in the cost-finding techniques herein employed.

Other Exploratory Costs

In a category for exploratory costs other than dry holes, the examiner included geological and geophysical

expenses, lease rentals, and exploratory overhead. These costs were the subject of testimony by Witness Roseman for the California Distributors and Witness Park for Texaco, Inc. Roseman estimated the cost of geological and geophysical expenses and lease rentals on the basis of their relationship to lease acquisition costs as shown by the Chase Manhattan Bank's Annual Analysis of the Petroleum Industry for 1961. Since the purpose and result of the outlays for geological and geophysical activities and lease rentals is the purchase of leases, there is a direct relationship involved. The Chase survey shows that geological and geophysical expenses and lease rentals average 138 percent of lease acquisition costs in the period 1957 through 1960, the same period Roseman used in computing lease acquisition costs. Having determined that the lease acquisition costs for that period were 0.76 cent per Mcf (see pp. 51-52), Roseman accordingly computed the geological, geophysical, and lease rental costs at 1.05 cents per Mcf.

Exploratory and developmental overhead were calculated by Roseman on the basis of their relationship to total finding and developmental costs. The 1958 Joint Association Survey, the only published source of such data, established overhead costs as being 8.4 percent of total finding and development costs, or 0.54 cent per Mcf. (Total finding and developmental costs were 6.42 cents per Mcf, this being the total of 1.05 cents for geological and geophysical expenses and lease rentals, 1.42 cents for dry holes, 2.88 cents for successful well costs, 0.76 cent for lease acquisition costs, and 0.31 cent for cost of

other production facilities.) Adding 0.54 to the 1.05 cents per Mcf costs for geological, geophysical, and lease rental costs, results in a total of 1.59 cents for the category of Other Exploratory Costs.

Witness Park used a different method. He combined geological and geophysical expenses, lease rentals, and overhead into a single item. He then found that the ratio of this item to dry hole exploratory expense, based on the Joint Association Survey, was 1 to 1. His result is 1.56 cents.

We believe that Witness Roseman's approach which computes each of these items of cost on the basis of comparisons with items to which they are functionally related is preferable. In any event the difference between the two witnesses is *de minimis* and no exceptions were taken to the examiner's determination of 1.59 cents per Mcf based upon Roseman's testimony. We therefore adopt the examiner's finding as supported in the accord.

ADJUSTMENT FOR EXPLORATION IN EXCESS OF CURRENT PRODUCTION

The record establishes that additions to proved reserves of natural gas in the United States have exceeded production in each year. We believe it essential to encourage a level of exploratory effort which will continue to provide for findings in excess of production. Since

exploration and development losses are expensed by the industry in the year incurred, and are so treated here (but see our discussion of the possible use in the future of the project method, pp. 41-42), the allowance for such losses should be recouped from production during that year. The total cost of finding the necessary volumes of gas must be translated into an allowance per Mcf of gas produced so as to bring in the necessary revenues. To this end a conversion factor is necessary to adjust the per Mcf cost of unsuccessful E&D efforts from the volume of reserves discovered to the volume of gas produced during the year.

The ratio of findings to production vary from year to year. These ratios for gas-well gas were 122 percent in 160, 155 percent in 1961, 180 percent in 1962 and 122 percent in 1963, while the weighted average of findings of all gas was 127 percent of production for the years 1960 through 1964. The appropriate ratio for these purposes is a matter for careful judgment rather than scientific formula.

277,610

— 44 —

We recognize that what the industry has been spending is not necessarily the desirable expenditure in the public interest. We believe, however, that the level of recent expenditures represents an appropriate basis for determining the ratio which should be adopted. In applying judgment we conclude that the ratios for gas-well gas are the more significant, but they must be discounted in view

(277,610)

of atypical result 1962. If the 1962 figure is brought down to the level for 1961, the four-year average becomes 138 percent. These figures point to an adjustment figure in the range of 35 to 40 percent. In these circumstances we shall utilize the 37 percent figure adopted by the examiner with which all parties have concurred. We believe such a ratio provides a necessary adjustment of the allowance for E&D for new gas-well gas to permit a level of findings reasonably in excess of production. Applying this ratio to the 3.01 cents per Mcf for E&D results in an additional 1.11 cents per Mcf allowance.

The examiner reached a similar result although he associated his allowance, which he termed an "allowance for growth", with a precise reserve-production ratio for the future, a rationale which we cannot accept. However as we have explained, we are satisfied that his conversion factor approximately represents the recent history of findings and is an appropriate conversion factor to permit the recovery of the cost of exploration and development during the year incurred.

The Major Producer Group's exception on this point, which is based on a contention that the ratio of reserves to production should be increased to 20 to 1, is denied. See *supra*, pp. 25-28.

Summary of Exploration and Development Costs

The exploration and development allowance which we here provide as a component of the cost of new gas-well gas will permit the industry to recoup from current pro-

duction all costs presently being incurred in a satisfactory level of exploratory effort. In effect we have found that the industry is now spending approximately 4.12¢/Mcf for exploration and development computed on the basis of the total production of new gas-well gas. Our allowance for E&D provides the industry with the funds to continue the same ratio of E&D in relation to volumes produced.

277,611

— 45 —

PRODUCTION OPERATING EXPENSE

On the basis of testimony by Witness Roseman on behalf of the California Distributors, the examiner found that a cost of 2.88 cents per Mcf was proper for production operating expense. Witness Park, presented on behalf of Texaco Inc., testified that the amount should be 2.62 cents per Mcf, or 0.26 cent lower. Both Park and Roseman derived their figures from the data on nationwide production costs received by this Commission in response to the questionnaire circulated to Permian Basin producers.

The basic differences between Roseman's and Park's results are two-fold. The first is that in the allocation of overhead expenses Roseman used direct lease cost and expenses, including depletion, depreciation and amortization (DD&A). Park, on the other hand, used direct lease costs and expenses, but excluded DD&A. We find that Park's exclusion of DD&A was proper for the reasons

set forth in discussing this issue in connection with flowing gas in Appendix C, page 3.

The second difference is that Roseman made an adjustment of the production operating cost to reflect national production of condensate and gas, rather than relying strictly on the questionnaire data for production of condensate and gas. His justification for such adjustment, which the examiner adopted, was that the respondents filing questionnaire data produced a disproportionately large amount of lease condensate in relation to their gas production. (They produce one-half of the national lease condensate but only one-third of the national gas-well gas.) Park did not make such an adjustment. We agree with Roseman that this adjustment should be made because of the disproportionate production of condensate. We adopt Roseman's production operation expense allowance but modify it to reflect the proper overhead allocation. Making this modification, the production operating cost is 2.70 cents per Mcf.

277,612

— 46 —

ADJUSTMENT OF NET PRODUCTION TO MARKETED PRODUCTION

The examiner included no special item in his cost computation to reflect the costs of gas produced but not sold. Witness Park included a 5-percent adjustment which he said was to compensate for waste, for venting, and for gas consumed on the producing property. The

Major Producer Group contends that there should be at least a 2-percent adjustment. The annual reports of the Texas Railroad Commission and the Louisiana State Conservation Commission for 1960 show that in these states, which produce 75 percent of the nation's gas-well gas, less than one-tenth of one percent of the gas was vented and wasted.

We agree with the examiner for the reasons stated at pages 85-86 of his opinion that there is no justification for making any allowance for the negligible amount of gas vented or wasted.

NET LIQUID CREDIT

When gas is produced some of the entrained liquids may condense while the gas is being lifted or shortly thereafter, and some of the liquids may be extracted by processing operations. The producers often receive substantial revenues from the sale of the liquids independently of the price they receive upon sale of the gas, and such liquids are an important item of commerce. Witness Roseman, on behalf of California Distributors, and Witness Park, on behalf ofTexaco Inc., both credited the revenues received by gas producers from the liquids contained in the gas to the cost of finding and producing the gas. The Major Producer Group now contends that no liquid credit should be adopted. Staff, on the other hand, has excepted to the examiner's determination that the proper amount of the liquid credit is 2.68 cents per Mcf, net, after royalties and production taxes are deducted, and contends that the proper amount for new gas-well gas is 3.27 cents per Mcf.

(277,612)

As to the basic issue whether it is appropriate to credit the cost of gas with the liquid revenues, we adopt the examiner's views as follows:

277,613

— 47 —

> The logic of crediting the revenues from the liquids is that the producer can reasonably expect that, from a proposed expenditure in the generally directional search for and production of gas-well gas, he will receive revenue from the liquids as well as from the gas. Thus he may count against his prospective total cost the expected revenues from the liquids. The remainder represents the revenues to be derived from the gas if the total costs are to be met, and is the cost burden that has to be borne by the gas. Since the price of lease condensate has been relatively stable in recent years[11] and since the credit amounts to only sixteen percent of the price for new gas-well gas adopted herein, it is not likely that changes in the price of condensate will produce significant swings in the price of gas. In these circumstances, crediting the liquids is reasonable for the purpose used here. (Initial Decision, Appendix, B, pp. 88-89.)

The producers' argument to the contrary is essentially that since the Commission does not regulate the sale of

---

[11] Average prices for lease condensate were: 1954, $3.01 per barrel Census; 1958 $3.05, Census; 1960 $3.03, Appendix B.

liquids it is improper to credit revenues. This is equivalent to saying that oil-well gas should be priced at the total cost for both oil and gas because we do not regulate oil prices. The argument has been rejected by the courts with respect to crediting of liquid revenues extracted by pipelines.[26]

Witness Roseman's testimony and the presiding examiner's determination as to the amount of the liquid credit were based upon published statistics of the American Petroleum Institute (API) and the *Oil and Gas Journal*. The gross credit is derived by multiplying the condensate production from gas-well gas by the price received for the liquids and dividing this amount by the total gas-well gas production for the year in question. Using the *Oil and Gas Journal* production figures, the examiner concluded that 3 cents per Mcf is a reasonable estimate for the gross lease liquids credit from which he deducted royalty of 12.5 percent and production tax to obtain a net credit of 2.48 cents, exclusive of plant liquids revenue which we shall treat separately.

All of the statistical series point to the conclusion that there has been an increase in condensate production from gas-well gas since 1960, a rate of increase which is greater than the rate of increase in finding and producing gas

Summary of the Cost of Flowing Gas

The cost of old gas-well gas may therefore be summarized in accordance with the evidence presented by Staff and the discussion above as follows:[40]

[40] There is no separate item for royalty payments because costs were computed on the basis of ⅞ of the actual volumes and the royalty payments were thus included as an integral part of the cost-of-service computations.

Production	9.16
Exploration and Development	4.08
Regulatory expense (see p.)	.14
	13.38
State production tax @ 7%	1.01
Total	14.39

COMPARISON WITH EXAMINER'S COMPUTATION OF COST OF OLD GAS-WELL GAS

As we noted at the outset we place primary reliance on the historical test-year cost of service presentation. However, the examiner's method of computing the cost of old gas-well gas, with the revisions we think necessary, serves as a useful check on the results. It yields a cost closely comparable to that derived from the more traditional cost-of-service approach.

The examiner found that the cost of old gas-well gas should be fixed at the average cost of gas-well gas

produced in 1960. Gas produced in 1960 resulted from exploration and development conducted in some cases many years before, and the cost of drilling and equipping wells which produced gas

in 1960 was incurred in years ranging over a span of two decades. Accordingly, the examiner adjusted his exploration and development costs to reflect the lower cost in earlier years.[41]

We think that the procedure used by the examiner to arrive at his old gas-well gas cost is reasonable but that certain items of his computation require revision.

The examiner found that total exploration and development costs for old gas (dry-hole costs, other exploration and development expenses, and allowance for growth) should be 25 percent below the figure of 4.12 cents per Mcf applicable in the case of new gas-well gas.

[41] In view of the impracticability of determining such costs directly, the examiner used the following procedure, outlined in Appendix C to the initial decision: "The purpose of this analysis is to compare the average finding cost of old gas well gas (the gas produced in 1960) with the cost of finding new gas well gas (the reserve additions found in 1960). The general procedure follows these main steps: (1) the total volume of gas well gas produced in 1960 is distributed by estimated year of discovery; (2) the volume associated with each year of discovery is weighted by an index of drilling cost per MCF for that year (1960=100); and (3) the results are totaled and then divided by 1960 production, thereby deriving a weighted average finding cost for the gas produced in 1960 relative to the finding cost of gas well gas found in 1960. The basic data for this analysis consists of: (1) production of gas well gas reserves; (2) estimates of annual additions to gas reserves; and (3) indices of annual drilling costs per Mcf of reserves added."

This discount yielded a figure of 3.09 cents per Mcf for exploration and development. Production investment costs, DD&A and return, were similarly discounted 25 percent from the 3.95 cents and the 5.21 cents, respectively, applicable in the case of new gas-well gas, yielding a DD&A of 2.96 cents per Mcf and a production investment return of 3.91 cents per Mcf applicable to old gas-well gas.

Unlike production investment costs, exploration and development costs are not capitalized in our decision in this proceeding. They are expenses to be recouped by a producer in the year in which they are incurred. The fact that a lower original investment was necessary to

produce gas flowing in 1960 does not affect the exploration and development expenses incurred in that year. Accordingly, these costs should not be discounted, but should be the same as those included in the computation of the cost of new gas-well gas. We shall therefore allow the same amount for E & D as we permitted in the price of new gas-well gas.

In computing the production investment for old gas-well gas staff contends that it should be 84 percent of the new gas-well gas investment cost rather than 75 percent as a result of two revisions of the examiner's method. Staff accepted the examiner's method of deriving the cost of flowing gas-well gas; however, it proposed an 84 percent rather than a 75 percent discount factor as a result of two revisions of the examiner's method.

Staff's first revision of the examiner's approach was a technical adjustment of the annual index of drilling and equipping costs per Mcf added. The examiner's index measures the trend of the allocated cost of total gas reserves added (gas-well gas and oil-well gas), whereas Staff's index measured a trend of unallocated gas-well costs per Mcf of gas-well gas only reserves added. Since we are deriving a gas-well gas cost it appears that Staff's index is preferable to the examiner's index. Staff has utilized an index which produces a result approximately the same as the examiner's but avoids many of the complicated allocations. Accordingly, we will use Staff's index of drilling and equipping costs.

Staff's second revision of the examiner's backtrend method was to apply its national drilling and equipping cost trend to the vintage mix of jurisdictional gas-well gas produced in the Permian Basin rather than applying the cost trend to the vintage mix of all flowing gas-well gas on a nationwide basis, as was done by the examiner. We have determined that the ceiling price for flowing gas-well gas should be fixed primarily on historical costs in the area (*supra*, 78-79, 80-81). Therefore, the gas-well gas cost trend should be applied to the vintages of gas-well gas in the area.

These adjustments result in a figure of 3.32 cents for DD&A and 4.38 cents for return on production investment rather than the 2.96 cents and 3.91 cents, respectively, used by the examiner.

(277,658)

With respect to all other items we shall follow the examiner's technique and use the same items of cost as used in the new gas-well gas computation. With respect to the amount for net liquid credit a word of explanation may be in order. The Commission concluded that the net liquid credit should be 3.10 cents per Mcf, rather than 2.68 cents per Mcf as allowed by the examiner. The Commission based its determination primarily on questionnaire data but in our discussion we pointed to the trend in recent years toward increased realization of condensate per Mcf of gas. The trend for the future has limited application to the liquid credit for flowing gas, but we do not rely on this factor and it is not material to our conclusion. The liquid credit we used for new gas-well gas is primarily based upon the questionnaire data which reflects the historical experience of condensate production. The figure we adopted is lower than the amount that could be justified by the latest statistics showing condensate production from the recent discoveries, especially those at greater depths. We believe that our allowance for liquid credit conservatively reflects the condensate derived from the flowing gas-well gas the costs of which we are attempting to verify.

The examiner's computation of the cost of old gas-well gas and our modification of his computation of course reflect the net differences in numerous other items previously discussed in our determination of a new gas-well gas price. A complete comparative summary follows.

(277,659)

277,659

	Cost in Cents per Mcf	
	Examiner	Commission
Exploration and Development Costs		
Dry Holes	1.07	1.42
Other Exploratory Costs	1.19	1.59
Allowance for Growth	.83	1.11
Production Operating Expense	2.88	2.70
Net Liquid Credit	(2.68)	(3.10)
Regulatory Expense	.14	.14
Depletion, Depreciation, and Amortization of Production Investment Costs		
Successful Well Costs	2.16	2.42
Lease Acquisition Costs	.57	.64
Cost of Other Production Facilities	.23	.26
Return on Production Investment (at 12%)	3.91	4.38
Return on Working Capital	.20	.35
Subtotal	10.50	11.91
Royalty at 12½%	1.60	1.83
Production Taxes[42]	.72	.90
Total	12.82	14.64

[42] Texas production taxes of 7 percent have been used in this computation. New Mexico taxes are lower, and both cost computations and the ceiling price should be reduced accordingly for gas produced in New Mexico. The amount of production taxes does not include taxes on the royalty payments which are chargeable to the royalty owner. The results however are identical to the alternative method summarized at page 89 in which royalty payments were computed as an integral part of the cost of service and the separate item for production taxes was somewhat higher because it included taxes chargeable to the royalty owner.

It is apparent that the results obtained by using the examiner's method, as adjusted in the light of the Commission's views on liquid credit, return and other items, conform very closely with the results obtained in the Commission's own historical cost computation.

THE PRICE OF FLOWING GAS

On the basis of an historical cost determination, as verified by the examiner's approach, we shall fix a ceiling price for flowing gas rounded off at 14.5 cents per Mcf at 14.65 psia for gas produced and sold in Texas. The ceiling price in Texas includes a 1.01 cent production tax, which we round off to 1.0 cent, leaving a rate less production taxes of 13.5 cents. For gas produced and sold in the three New Mexico counties, Chavez, Lea and Eddy, the ceiling price shall therefore be 13.5 cents per Mcf at 14.65 psia plus the applicable production taxes in effect as of the date of this opinion. In accordance with the earlier discussion, this ceiling price will apply to all casinghead gas, and residue derived therefrom, both old and new, as well as to old gas-well gas and residue gas derived therefrom.

PRICE ADJUSTMENTS TO REFLECT QUALITY DIFFERENTIALS

The importance of quality standards as an integral part of our ceiling price becomes readily apparent if it is recognized that gas is purchased for its energy. The

price of gas cannot be related to volume alone but must be related to units of energy free of impurities and sufficiently compressed to enter the pipeline if it is to serve as a mechanism to assure just and reasonable rates. The presiding examiner pointed up the importance of relating the quality of gas to its price as follows:

> * * * Lowering the quality of the gas is the same as raising its price. If the pipeline purchases gas of lesser quality than previously, bears the cost of additional processing to raise the gas to its former standard, and includes the added costs in its cost of service, the result is the same as if the prices charged for the gas by the producer were raised. A pricing system that fails to insure quality and value is a sieve. [p. 67]

Some of the respondents have urged that no specific price differentials be established to reflect variations in quality. They argue that buyer and seller, after a ceiling price is fixed, will establish lower prices for gas of below standard quality by bargaining.

If we accepted the producers' contention, the burden of securing lower prices to reflect lower quality gas would be on the pipeline, and the record does not support the producers' contention that through bargaining the parties would necessarily agree upon prices for gas with quality deficiencies which were below the ceilings imposed for pipeline quality gas. A large loophole for evasion of

ceiling prices would lie open; a producer receiving the ceiling price for inferior quality gas would be piercing the ceiling prices, insofar as the consuming public is concerned, just as much as if the producer were collecting

an above-ceiling price for pipeline quality gas or deliberately diluting the gas with inert material. In addition, gas now flowing under existing contracts would not be repriced, whatever bargains might be made for the future. Its price would be governed by the existing contract terms, limited only by the applicable area price ceilings. We think, therefore, that in this proceeding we must require the area ceiling prices for new gas-well gas as well as flowing gas to be adjusted for departures from the standards for gas of pipeline quality. We believe that the record in this case provides an ample basis for the quality guidelines we here establish.

A preliminary question is the basis upon which the quality adjustments should be applied. We think these price differences should be predicated upon differences in the quality of gas sold under particular contracts rather than upon an averaging process. Such an approach is fairer to the individual producers, and avoids the possibilities of manipulation which would be inherent in a price system which failed to reflect quality differences in particular transactions.

Quality Standards

The first step in establishing price variations corresponding to variations in the quality of gas is to determine the quality standards which must be met if gas is to command the ceiling price applicable to its particular category. There are several quality factors which require consideration in establishing prices in the Permian Basin and we shall discuss each of them separately.

Sulphur

Sulphur, hydrogen sulphide, and other sulphur compounds are the most prevalent impurities in gas in the Permian Basin. The problem is greater here than in any other area in the country. The generally accepted standard in the Permian Basin, which we here adopt is that gas

which contains more than 10 grains of hydrogen sulphide or 200 grains of total sulphur per Mcf is designated as "sour gas" and is not considered to be of pipeline quality.[43] Gas containing 10 or less grains of hydrogen sulphide and 200 or less grains of total sulphur is known as "sweet gas" and is considered to be of acceptable pipeline quality in this respect. These standards are not only generally accepted in the Permian Basin, but it does not

[43] Total sulphur shall be determined as provided in: "Test for Total Sulphur in Fuel Gases" ASTM Designation: D 1072-56, adopted 1956.

CARD 11

appear that any different standard with respect to sweet and sour gas is applied in other areas.[44]

Water

The record establishes that an accepted standard for pipeline quality gas in the Permian Basin is that the gas shall not contain in the aggregate more than 0.009 pound per Mcf of water, either in the form of liquid or vapor.[45] The prevailing national standard appears to be that gas should contain no more than 0.007 pound of water per Mcf of gas. Even more stringent standards appear in some of the contracts for sale of gas in the Permian Basin.

It may be argued that, since the national average cost has been used in arriving at the ceiling price for new gas-well gas fixed in this proceeding, the national standard for such gas should apply rather than an area standard. Until such time as this Commission has by rule established a different standard, we prefer to adhere to the accepted practices of the industry in the area and we shall consider gas in the Permian Basin containing not more than 0.009 pound of water per Mcf to be of pipeline quality.

---

[44] We are cognizant of the slightly more liberal definition of sweet gas used by the State of Texas.

[45] Water vapor content is to be determined as provided in: "Test for Water Vapor Content of Gaseous Fuels By Measurement of Dew-Point Temperature". ASTM Designation: D 1142-58, adopted 1953, revised 1958.

Carbon Dioxide

Carbon dioxide is found in excessive quantities, sometimes as much as half of total volume, in 2 to 3 percent of the gas produced in the Permian Basin. It is not combustible and so has no value as fuel. Under the present technology, it contributes nothing in the way of liquids and is valueless to the petrochemical industry. It is not merely a diluent which reduces the value of the gas in proportion to the extent that it is present; it combines with H_2O to form a comparatively mild acid which has a corrosive effect on pipelines. When present in large quantities, its removal is required before the remaining gas can be considered to be of standard pipeline quality, and extraction may be costly.

The evidence in the record indicates that where carbon dioxide is a problem in the Permian Basin, it comprises over 5 percent of the volume of the gas. However any amount of carbon dioxide reduces the value of the gas and we believe that the presence of more than 3 percent of useless diluent in the gas sold to a pipeline would require a reduction in the price. Accordingly, for the purpose of this proceeding, a standard for pipeline quality gas shall be that carbon dioxide shall not exceed 3 percent by volume.

Other Impurities

There was no testimony in the record with respect to impurities other than carbon dioxide, water, sulphur,

hydrogen sulphide, and other sulphur compounds. Some filed contracts contain clauses requiring the gas sold under them to be free of oxygen, dust, dirt, gums, and other substances. Precise standards cannot be established with respect to these impurities. The only standard which may fairly be applied, on the basis of this record, is that such impurities will be considered excessive to the point requiring a reduction in the price of the gas if they are present in sufficient amounts so that a pipeline incurs processing costs to remove them from the gas.

— 99 —

Btu Content

The record in this case reveals that in the past the level of Btu content (other than loss of Btu's resulting from excessive carbon dioxide content) has not been a substantial problem in the Permian Basin. Contracts for sales of gas in the Permian Basin generally contain clauses specifying that the Btu content of the gas sold shall not be less than a minimum, generally 1,000 Btu's; and little gas below that level (other than gas containing substantial amounts of carbon dioxide) has been sold in the Permian Basin. Any attempts to evade the ceiling prices for flowing gas imposed herein by reducing the Btu content of the gas below current standards in the area will come to our attention and many be dealt with as the occasion demands. Under these circumstances we see no need to establish any standard Btu

content for flowing gas in the Permian Basin so long as present conditions continue.

Looking to the future, however, we believe that it is important that we implement the general principle that Btu adjustment provisions "are in the public interest", advanced in our recent decision in Texaco, Inc., Opinion No. 464 (decided June 10, 1965). While Btu adjustments have not played a major role in the Permian Basin in the past we believe it important that our price for new gas-well gas reflect the energy content of the gas, which in reality is what the consumer is purchasing. We therefore believe it is necessary and appropriate to provide an upward adjustment for this premium quality feature of benefit to the consumers as well as to provide downward adjustments for deficiencies in quality for new gas-well gas. Such adjustments are to be used in computing the applicable price for new gas-well gas irrespective of whether the underlying contracts contain a Btu adjustment clause. However a producer will of course be limited by his contract if it is below the applicable ceiling as adjusted.

We believe the weighted average Btu content of gas-well gas in the area should generally be used as the guideline for upward adjustments. The weighted average Btu content for gas-well gas in the Permian Basin as shown in Exhibit 118 is 1,042 Btu's per cubic foot. That exhibit reflects the facts for over half of the gas-well gas in the area, and while the precise figure may be somewhat higher

or lower, the exhibit indicates that the weighted average is certainly well above 1,000 Btu's per cubic foot and does not exceed 1,050 Btu's. Accordingly, in computing the quality adjustments to the ceiling prices for new gas-well gas we shall permit an upward Btu price adjustment from a base of 1,050 Btu's per cubic foot on a proportional basis above the ceiling price fixed herein. The record also reveals that a minimum standard for pipeline quality gas in the Permian Basin is 1,000 Btu's per cubic foot. The 1,000 Btu minimum is not a national standard but is based on the evidence of the practice in the Permian Basin. We shall accordingly provide a downward adjustment for new gas-well gas from a base of 1,000 Btu's on a proportional basis from the ceiling price fixed herein.[46] The range of 1,000 to 1,050 Btu in which no adjustment will be required in the Permian Basin is not necessarily controlling for other areas where the record may well suggest a narrower range.

The Btu content of the gas to be used in determining price adjustments can be defined as the total heat value of the standard cubic foot as specified in Opinion No. 464. So that no producer will be penalized twice by the application of a reduction in rate for Btu deficiency in addition to a reduction required by the presence of carbon dioxide or other impurities, the Btu content should be measured after any necessary processing of the gas to remove impurities, as well as after removal of any liquids

[46] For example, new gas-well gas containing 1,155 Btu's will be allowed a 10 percent increase in rate, and new gas-well gas containing 950 Btu's will be subjected to a 5 percent reduction in rate.

for which the buyer pays separately, whether on a percentage basis or otherwise.

—101 —

Pressure

The question of pressure is more complex. Gas cannot enter a pipeline unless it is under greater pressure than the pipeline pressure at the point of entry. Gas of lower pressure must be compressed to raise its pressure above that of the pipeline which it is entering. It is not the number of pounds by which a given quantity of gas may fall over pipeline pressure that is important, but the number of stages of compression through which the gas must be put in order to raise its pressure sufficiently. The majority of the main-line pipelines in the continental United States operate to maintain a pressure at the compression stations ranging from 800 pounds to 1,000 pounds per square inch (psi) or about 900 psi on the average. Evidence in this case of actual delivery pressures for producers in the Permian Basin indicates that pipeline purchasers in the Permian area have main-line operating pressures averaging about 800 psi. Thus we are presented with the question of whether a national pressure standard of some 900 psi should be adopted here or whether we should use the average pressure in the Permian Basin of about 800 psi.

It could be argued that where national average cost is used in establishing a ceiling price, the average national pressure should also be used in establishing the standards

to which gas priced at the ceiling must conform. However, the prices we fix here are area prices, and may be modified in other areas for factors other than cost. The adoption of a 900 pound pressure standard for the Permian Basin would require a price reduction on all Permian Basin residue gas and nearly all gas-well gas. While delivery of gas at higher pressure would confer some benefits on the pipeline (by reducing the amount of compression needed to move gas along the pipeline) it seems inequitable to penalize the producers and processors who deliver gas at the pressure for which the pipeline is designed and who in many cases could have delivered it at higher pressure if called upon to do so, without additional expense. The physical equipment in the Permian Basin is now largely geared to delivery at 800 pounds pressure. We shall therefore adopt an 800 pound pressure standard for the Permian Basin.

— 102 —

The Amount of Price Adjustment

In accordance with the foregoing, we set forth the following principles to govern price adjustments when a purchaser buys gas which deviates from the standards here established for gas of pipeline quality:

(1) The applicable ceiling price shall be adjusted downward by the net cost of processing the gas to bring it up to standard, by the amount of any applicable upward or downward Btu adjustment (for new gas-well gas only) and by the amount of any sav-

ing or additional expense to the seller from any reduction or increase in taxes or royalty payments resulting therefrom.

(2) If the processing is performed by the purchaser, a reasonable return upon the required investment should be included as a part of the processing cost incurred in bringing the gas up to pipeline quality.

(3) If processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

Procedure

In establishing a procedure for determining the amount of the reduction in the ceiling price applicable in the case of gas with quality deficiencies, our purpose is to impose the minimum regulatory controls required to carry out effectively our responsibilities to assure wholesale customers that the price they pay will be just and reasonable. Accordingly, sales by small producers that are covered by the proposed small producer certificate rule, shall be exempt from such adjustments on the *de minimis* principle, because the burden and expense involved would in most cases exceed the amount of the adjustments. Furthermore, the major producers, processors, and pipelines will be allowed in the first instance to establish among themselves, in accordance with the standards set forth here, the amounts by which ceiling prices should be adjusted in the case of each individual contract which deals with gas which deviates from the quality standards

herein established. If the parties reach agreement that no change from the ceiling price is required or that a specific price adjustment is required, a statement

of the agreed price for the gas shall be filed no later than 90 days from the effective date of this order. The producer as part of the statement shall itemize the amounts and nature of each of the quality adjustments and explain the basis therefor, and set forth the price agreed upon by the parties as representing the applicable ceiling price as adjusted.

If the parties are unable to agree upon any or all of the quality variations of the gas or the costs of remedying defects (except for sales by small producers exempt from these quality adjustments), the required statement must so indicate and the seller must supply the itemized information required to compute the applicable ceiling price as adjusted. The buyer will be given an opportunity to state its position and the Commission will then determine the applicable area rate. Pending such determination, the seller may collect a price not in excess of the unadjusted area ceiling price for the type of gas in question, subject to the obligation to make refund of any excess collected, from the effective date of this order, above the applicable area rate (the ceiling rate reduced by the cost of processing to correct quality deficiencies and, in the case of new gas-well gas, further adjusted for Btu variations) ultimately determined to be proper.

No pipeline will be entitled, as part of its cost of service, to any amounts paid for gas in excess of the applicable ceiling price as adjusted in accordance with the standards and principles set forth in this opinion. The acceptance for filing of any amendment or certificate, or the failure to suspend any rate so established, shall not prevent the application of this rule.

It is our expectation that this procedure will result in the parties determining the proper adjustments in price levels to reflect differences in the quality of gas sold. Should this objective not be realized and should the Commission be confronted with a large number of contests, or should it be found that evasion or abuse is prevalent, it may be necessary to take measures to fix the precise price variations corresponding to variations in gas quality.

— 104 —

PETITIONS FOR SPECIAL EXEMPTION FROM THE AREA RATES

We have already discussed *supra* at pages 11-19 why we believe that maximum area rates can and should be established as the just and reasonable rates applicable generally to the sales of natural gas in the Permian Basin. The question remains what procedure or procedures should be adopted for the benefit of those respondents who, by reason of special circumstances, believe they can demonstrate that they are entitled to variant treatment.

First, we should frame the limits of the problem. We are not here treating sales to be permanently certificated after the effective date of this decision. In the future it would normally not be in the public interest to certificate sales of gas (including gas flowing under temporary certificates) at initial prices above the applicable area rate. While we do not visualize any reason for certifying any new sales at prices above the just and reasonable ceiling price, any producer unwilling to accept a certificate at the appropriate ceiling will have an opportunity to show in the hearing on his certificate application the special circumstances which he believes warrant making an exception in his case in the public interest.

The problem for our immediate attention thus relates solely to gas presently being sold under outstanding certificates. Our decision herein has a double impact on the gas presently flowing in interstate commerce from producers in the Permian Basin. It fixes a price for the future, and it determines the basis for refunds for past periods. We shall first discuss the basis for permitting special exceptions to the area rate with respect to future rates for flowing gas and later discuss the question of relief from refund requirements.

It would seem clear that where a producer who has contracted for an above-ceiling price can show that his out-of-pocket expenses in connection with the operation of a particular well are greater than the revenues under

the applicable area price, he should be entitled to appropriate relief, and there may be other circumstances where a producer as a matter of law or in the public interest would be entitled to some relief.

We need not and cannot here specify all of the special circumstances which may serve as a basis for exceptions to the area rate. It is clear however that confiscation does not result merely because, as a result of high costs or low production, a given producer cannot, at the area price, recover his expenses for his unsuccessful exploration and development costs and earn the 12 percent overall return on producer investment rate base which we have adopted as the appropriate return to attract capital on an area-wide basis for gas exploration and development. We recognize that any amounts received by the producer for flowing gas above out-of-pocket expenses would be available to finance further exploration, but no producer has a constitutional right to a price for the future which will enable him to expand his venture in the interstate gas business and the inability to earn such allowances at the area ceiling cannot be characterized as confiscation. As the Court of Appeals for the District of Columbia recently observed, "the Commission is not required to subsidize high cost producers with consumers' money." *Atlantic Refining Co.* v. *F.P.C.*, 316 F.2d 677, 680 (CADC, 1963); see also *Callery Properties, Inc. et al.* v. *F.P.C.* 335 F.2d 1004 (CA5, 1964). The same rule certainly applies to the development of reserves which are held off the market for speculative purposes.

Even in situations where producers are able to show that they are entitled to relief from the obligation to con-

tinue to sell flowing gas at the appropriate area ceiling, in most cases it may be sufficient to permit them to abandon their unprofitable sales. Unlike the case of some public utilities which cannot abandon service without harming the public dependent thereon, we will seldom have a situation in which a particular producer's

abandonment of some or all of its sales in the area will significantly affect the purchasing pipeline, to say nothing of the ultimate gas consumer. There may, however, be some exceptional situations where abandonment could be shown to be detrimental to consumers, or where the producer could demonstrate that some other form of relief would best serve the interests of the public as well as his own.

The remaining confiscation question is with respect to refunds for past periods. On a composite basis the area ceiling prices for both flowing and new gas provide a reasonable allowance for exploration and development and production operating expenses in addition to a 12 percent return on the producing investment. As we stated earlier, a claim that it would be confiscatory to require the refund of amounts a producer has collected above the area rate cannot be supported by the fact that a particular producer in the past has chosen to spend more than a reasonable allowance in what proves to be unsuccessful or marginal exploratory efforts or by the fact that unit production costs are high because for speculative purposes

or other reasons the producer has withheld from production gas that he has discovered. On the other hand it seems clear that a producer should not be required to make refunds for past periods which would deprive him of amounts sufficient to cover his out-of-pocket operating expenses in the Permian Basin for such period. We need not consider other situations at this stage of the proceeding; it is sufficient to note that here too we will entertain petitions for special relief, and that the dockets involved will remain subject to the existing interest obligations pending their resolution.

We need not speculate further here as to the exact circumstances in which special relief may be warranted from the area price maximums for some or all of a producer's sales, or the appropriate nature of such relief. Any producer claiming that he is entitled to special relief from the maximum rate set for any of his Permian sales or from the refund obligations imposed herein may file a petition for such relief with the Commission consistent with the general guidelines set forth herein. Any such petition will be disposed of as promptly as possible.

Since the petitioner will bear the burden of showing that he is entitled to special relief the producer (unless authorization is granted for temporary abandonment) will not be relieved of his obligation to continue service at the appropriate just and reasonable rate pending the determination

of his petition. See *The New England Divisions* case, 261 U.S. 184, 198-199 (1923).

CHANGES IN THE AREA RATE

Our adoption here of a two-price vintaging system of fixing just and reasonable producer prices simplifies questions as to the appropriate or permissible methods for changing such prices. The two-price system enables us to provide a higher price for future discoveries if justified by changed circumstances. It is unlike the situation resulting from the utilization of a single price based upon historical costs, where significant changes in conditions may necessitate a change in the just and reasonable price for all gas. For example, an indication that new well drilling costs were increasing might (all other things being equal) demonstrate that a higher price should be set for gas certificated at some date in the future but would not necessarily show that the just and reasonable price we here prescribe for gas already flowing requires revision. Other changes unrelated to the continuing operations under which flowing gas is brought to market will be relevant only to the question of whether a new price should be set to govern future sales, thus permitting price stability for gas already dedicated to the interstate market.

This does not mean that the just and reasonable price for flowing gas can never vary. We have fixed the price of the pre-1961 gas-well gas and all other gas on the basis of the composite cost showing of gas-well gas for the Permian Basin in 1960. Of course if it could be shown that the average rates of take of such gas had

significantly dropped or that the continuing operating costs of the gas wells had increased significantly, it might well be that the maximum just and reasonable price for such gas should

be adjusted. This would also be true for the gas coming into the market since 1960, although the evidence of record indicates that costs have remained remarkably steady during the ensuing years and are likely to remain stable during the moratorium period prescribed herein. Essentially, under the type of pricing we are instituting, the cost of flowing gas-well gas and all casinghead gas and residue gas derived therefrom will tend to remain relatively constant and permit stable rates, even though changing circumstances might demonstrate the need for new and substantially different rates for gas-well gas coming on to the market at later periods.

In this framework, we approach the question of the appropriate mechanism for altering the area rates. We can, of course, in this proceeding fix the just and reasonable price only for gas flowing pursuant to outstanding certificates. We believe that a moratorium for new rate increase filings above the applicable area ceiling prices for a 2½ year period is essential if our decision herein is to achieve effective control over producer prices. In the absence of such a moratorium the producers would be free to file rate increases and continue to collect their producer prices even though they exceeded the just and

reasonable rates herein prescribed. Without a moratorium, the conclusion of one area proceeding would only signal the beginning of the next, and just and reasonable rates for consumers would always be one area proceeding away.

The Supreme Court recently noted the obvious inadequacies of the refund obligation as a protection of the public interest (*F.P.C.* v. *Tennessee Gas Transmission Co.*, 371 U.S. 145, 154, 155 (1962); *F.P.C.* v. *Hunt*, 376 U.S. 515, 524 (1964)). Without the moratorium we have provided the public interest could be protected only to the extent that the Commission could devise procedures to enable it to complete an area proceeding within the 5-month suspension period or shortly thereafter. See *F.P.C.* v. *Tennessee Gas Transmission Co.*, *supra;* cf. *Panhandle Eastern Pipe Line Co.* v. *F.P.C.*, 236 F. 2d 606 (CA3 1956).

277,675

— 109 —

While the Supreme Court's description of a Section 5 producer rate proceeding in the *Catco* case as "well nigh interminable" is, we hope, no longer apt, the more than four-year history of this case, conducted with acute awareness of the running of time, demonstrates that we are dealing with inherently time-consuming proceedings. We expect to complete future area cases in much less time, but we would be unrealistic in the extreme to assume that any rate proceeding could be completed in less than several times the length of the 5-month suspension period. Without the limited moratorium on rate

filings prescribed by our order herein this mammoth proceeding would fix prices for only a 5-month period and the producers could then overturn the Commission's order by a series of new filings to reinstate their pre-existing rates.

It is our view that the filing of rate increases by a natural gas company pursuant to Sections (d) and (e) can be limited either by private contract or as a result of the reasonable exercise of this Commission's authority under Sections 5, 7 and 16 of the Act. Certainly, it would be an anomalous situation if the filing of rate increases could be restricted by private bargaining but not by reasonable exercise of regulatory authority in the public interest. We have exercised such authority in this initial proceeding fixing rates on a group basis under the Natural Gas Act because it is an essential feature of the area approach if it is to achieve effective control over producer prices for the protection of consumers. We believe the 2½ year period is the minimum time required to afford price stability that will be beneficial to consumers and the industry as well. Considering the evidence of stable costs, and the provisions for earlier relief, if warranted, this limited moratorium is not unfair to producers.

The producers nevertheless contend that pursuant to the provisions of Section 4(d) of the Act, a natural gas company has a right to file any contractually authorized rate increase even if the Commission has just held that the maximum just and reasonable price for such sale is of a lesser amount. They argue that the only procedure available

to the Commission is to enter into the suspension and hearing procedure established by Section 4(d), with the company having the right to put the increase into effect subject to refund at the end of the maximum statutory five months' suspension period.

We do not believe that the Commission's powers are so limited that its regulatory efforts must be futile where after a long and full hearing we have determined the just and reasonable rates to be set for the future. The *Mobile* case (*United Gas Pipe Line Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332, 339 (1956)) made clear that:

> * * * § 4(d) is simply a prohibition, not a grant of power. It does not purport to say what is effective to change a contract, any more than § 4(c) purports to define what constitutes a "contract" that may be filed with the Commission. The section says only that a change *cannot* be made without the proper notice to the Commission; it does not say under what circumstances a change *can* be made * * * [emphasis in original]

It is true that despite the Court's explanation of the meaning of Section 4(d) as simply a prohibition on filings, and not a grant of power, the opinions of the Court in *Mobile* and in the subsequent *Memphis* case (*United Gas Pipe Line Co.* v. *Memphis Light, Gas & Water Division*, 358 U.S. 103 (1958)), contain dicta to the effect that a pipeline can file for such increases as

are contractually authorized and after the suspension period, put them into effect subject to refund. See also *Atlantic Refining Co.* v. *Public Service Commission of New York* (CATCO), 360 U.S. 378 (1959). These dicta must be read in context of the issue raised in the cases, which was the effect of restrictions on increased rate filings by pipelines stemming from contractual limitations by the parties in circumstances where the pre-existing rate had not been fixed by the Commission pursuant to its authority to prescribe just and reasonable rates for the future. These cases dealt with regulation on an individual company basis in which there is a long administrative

history of permitting increased rate filings and where the Commission as a matter of policy has never written a moratorium into a rate order. They are entirely consistent with our recent order in *United Gas Pipeline Co.*, RP65-1, ... F.P.C. ....., issued October 22, 1964, where in refusing to reject an increased rate filed by a pipeline we made clear that "the Commission is [not] completely without discretion to impose by rule or by order a reasonable moratorium on the filing of rate increases under Section 4(d) of the Act in circumstances where the orderly administration of the Natural Gas Act makes such conditions necessary."

The authority we assert herein is neither novel nor unique as applied to group rates set after full agency hearing. The ICC operating under a statute containing

language virtually identical to Section 4 of the Natural Gas Act long ago stated that "to say that the Commission's order may be defeated merely by publication and filing of a rate higher than that prescribed by the order is to say also that the shipping public is not entitled to the protection of this Commission's orders during the period they are in force * * * *." (*City of Springfield, Tenn.* v. *Louisville N.R. Co.*, 53 ICC 603, 605, 606 (1919); see *Fifteen Per Cent Case*, 45 ICC 303 (1917).) The CAB has similarly held that a group rate fixed by the Board could only be modified by subsequent Board action and not by a carrier's unilateral filing. *Minimum Rates Applicable to Air Freight* Order No. E-17370, 34 CAB 263 (1961).

The Supreme Court has expressly held in *United States* v. *Corrick*, 298 U.S. 435, 439, 440 (1936), that where the Secretary of Agriculture under the provisions of Section 310 of the Packers & Stockyards Act (7 U.S.C. § 211 (1921)) prescribes "the just and reasonable rate or charge, * * * to be thereafter observed" such rates "become the only lawful rates and so remain until further order of the Secretary" and cannot be altered by the unilateral action of a particular marketing agency pursuant to provisions of Section 306 of the Packers & Stockyards Act (7 U.S.C. § 207). That section is virtually identical with Section 4 of the Natural Gas Act.

277,678

— 112 —

It cannot be argued that the ICC and Packers & Stockyards Acts precedents are not in point because those acts

expressly provide that orders fixing just and reasonable rates "shall continue in force until [the agency's] further order" (see Interstate Commerce Act, § 15(2), 49 U.S.C. § 15(2); (1887); Packers & Stockyards Act, § 313, 7 U.S.C. § 214). The ICC adopted the position noted above before the language in question was introduced into its Act in 1920[47] and the Supreme Court in *Corrick* supported its conclusion not by reference to the different language of Section 313, but by the quoted language of Section 310 which parallels Section 5(a) of the Natural Gas Act and by citing its earlier decision in *Arizona Grocery Co.* v. *Atchison T.&S.F. Ry. Co.*, 284 U.S. 370 (1932), standing for the general proposition that where the agency "declares a specific rate to be the reasonable and lawful rate for the future, it speaks as the legislature and its pronouncement has the force of a statute" (284 U.S. at p. 386).

The absence in the Natural Gas Act of language similar to that found in Section 15(2) of the Interstate Commerce Act and Section 313 of the Packers & Stockyard Act, means only that Commission orders under Section 5(a) do not automatically have the effect of tolling the availability of Section 4 filings (see *United Gas Pipe Line Co., supra*). It leaves the Commission free to exercise its express authority to "fix" by order "the just and reasonable . . . rule, regulation, practice or contract to be thereafter observed and in force" (Section 5(a)) and to "perform any and all acts and to prescribe . . . such

[47] Cf. Section 3 of the Hepburn Act of 1906 (34 Stat. 589) with Section 418 of the Transportation Act of 1920 (41 Stat. 484).

orders, rules and regulations as it may find necessary or appropriate to carry out the provisions of this act" (Section 16); See *Public Service Commission of New York* v. *F.P.C.*, 327 F. 2d 893, 896-897, (CADC, 1964).

277,679

— 113 —

The Commission under Sections 5(a) and 16 of the Natural Gas Act may impose a reasonable moratorium on increased rate filings under Section 4 which are inconsistent with the just and reasonable rates found after hearing, and require that during this period the just and reasonable rates be changed, if at all, solely by modification of its original decision after appropriate proceedings held in that docket. The orderly administration of the Natural Gas Act necessitates that we exercise such authority in fixing the rates for sales by gas producers on an area basis.

It will therefore be our policy to certificate new sales of gas in the future at initial prices no higher than the just and reasonable price for new gas, and upon condition that no increased rate higher than the ceiling price be filed before January 1, 1968 (a 2½-year period which we believe to be the reasonable duration for a moratorium on filings for rates higher than the ceiling prices fixed on the basis of this record), unless within such time, either upon the Commission's own motion or upon an adequately supported petition by some interested party, the Commission at its discretion decides to reopen this proceeding to consider whether a different rate or

rates should be adopted for sales certificated at subsequent periods. We expect that the just and reasonable rate for new gas would constitute the maximum price at which new gas would be initially certified, the so-called "in-line" price, until the just and reasonable rate is changed by the Commission.

As to existing sales, whether they fall within the categories to which the flowing gas or new gas-well gas rates are applicable, we shall, pursuant to our authority under Sections 5 and 16 of the Act, similarly provide against any filing of rate increases above the applicable ceiling price fixed herein before January 1, 1968, but will permit any interested party within such period to file a petition directed to the Commission's discretion, showing why it believes the proceedings should be reopened to consider earlier changes. The Commission reserves the right to reopen the proceeding in its discretion to permit earlier changes in rates in the event of drastically changed circumstances. In any event after the 2½-year period, we shall also permit contractually authorized rate increase filings to be made pursuant to Section 4 for all sales in the area.

MINIMUM RATES

The examiner found that certain contracts in the Permian Basin were "below the revenue standards" he adopted. While the record is not clear on this point many of these contracts presumably were negotiated at a time

when natural gas was a by-product of the search for oil and the interstate markets had not yet developed.

To aid in rectifying the situations where producers had contractually precluded themselves from obtaining an increase in price of their gas, the examiner authorized the seller, with the consent of his buyer, to increase his rates up to the minimum established in the decision; to wit, 9 cents per Mcf of gas-well gas and 7 cents per Mcf for casinghead gas.

277,681

— 115 —

The Supreme Court in *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1956),[48] recognized that this Commission possesses the power to authorize rate increases despite contractual limitations to the contrary. However, the Court was careful to point out that such an order required as a foundation more than the mere fact that, because of an improvident bargain, a utility was receiving less than a fair price for its product. The Court said (at p. 355): "In such circumstances the sole concern of the Commission would seem to be whether the rate is so low as to adversely affect the public interest — as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory."

---

[48] Though this case involved the Federal Power Act, the Court noted that: "The pertinent provisions of the Federal Power Act, * * * are §§ 205(c), (d), and (e), and 206(a), which are substantially identical to §§ 4(c), (d), and (e), and 5(a), respectively, of the Natural Gas Act." (at pp. 350-351).

It is thus clear that the test of whether rates should be increased is not one of private equities but of the public interest. It is also clear that the examples set forth by the Court are not, and were not intended to be, the only instances where public interest would justify an authorization to increase rates in contravention of a contract. In addition it should be noted that the *Sierra* case was decided in the context of an individual company rather than an area rate approach.

We concur with the examiner in his conclusion that the establishment of minimum rates in this case is in the public interest and that the price impact on the consumer will be *de minimis*. While on the other hand, the establishment of a maximum price for the area is essential so that the ultimate consumer does not pay a price which is excessive in relation to group costs and other relevant considerations, we believe that a minimum price also

constitutes an integral part of the area rate approach. The rate received by a producer must not be so low as to prevent or retard further exploration and thereby decrease possible discovery of gas reserves which will be needed by consumers. The amount of additional revenue so provided, at the most $250,000 annually, will have no significant impact on consumers but the relief afforded the individual producers involved may be important to their continuation in the search for additional gas sup-

plies needed to meet the growing needs of the consuming markets.

Although we have agreed with the examiner's conclusion as to the need for a minimum rate, we believe that his remedy, which would not allow the producer with sub-minimum rates to raise them to the minimum unless he secured the approval of his purchaser, is not sufficient. Renegotiation of contracts resulting in increased rates which do not exceed the area rate would be proper without any action by this Commission, so that the examiner's remedy would avail nothing.

We therefore deem it necessary and appropriate to establish a minimum rate in this area of 9 cents per Mcf for gas of standard pipeline quality, with adjustments from the minimum price to reflect any deviations from the quality standards established herein, and to hold that the minimum rate herein established may be filed without purchaser approval at any time after this order becomes final.

REFUNDS

We shall require appropriate refunds in the case of rates which are the subject of proceedings under Section 4(e) of the Act, and have thus been collected subject to an obligation to refund amounts collected in excess of the just and reasonable rates as here determined. In each case the proper rate level for computing refunds shall be the area rate applicable to the particular category of gas involved, as adjusted by reason of any quality deviations in the particular gas.

The presiding examiner proposed that the total refunds to be made with respect to contracts for the sale of gas-well gas should be computed for each separate year on the basis of whether the industry as a whole had collected an excessive amount for gas-well gas in that year. Under this proposal, if one producer collected revenues from the sale of gas-well gas in excess of his proper prices, he would be required to refund such excess amounts only if it were shown that the industry as a whole in that year had received revenues from gas-well gas in the area in excess of the proper revenues for such gas. The same principle would be applied with respect to residue gas and to casinghead gas. Further, any deficiency in any year in overall industry revenues from any one of the three categories — gas-well gas, residue gas, or casinghead gas — would be used to offset excessive revenues collected for any other category of gas.

The underlying theory of the presiding examiner's approach is that refunds should be ordered only to the extent that overall industry revenues exceed overall industry expenditures in a given year. The briefs on exceptions indicate that many of the parties are not clear as to how this theory might be applied in particular cases.

Several fundamental objections preclude adoption of the examiner's proposed method of computing refunds. We think it would result in inequities among wholesale customers as well as among individual producers. If one

wholesale customer has been overcharged it is of little comfort to him to know that another customer has received a bargain. Conversely, if one producer has collected excessive amounts, he should not be relieved of his responsibility to return the excess by reason of the fact that some other producer collected too little. Furthermore, the administrative difficulties involved in attempting for each year, and each category of sales, to equate industry revenues with industry expenditures, and to allocate the excess revenues among the purchasers, seem almost insurmountable.

277,684

— 118 —

We have established just and reasonable ceiling prices for the Permian area, with adjustments from the ceiling prices in the case of gas which deviates from the quality standards we have established. The applicable ceiling price, including any quality adjustments, is the proper price for gas sold under a particular contract. We think it is proper and equitable to require refunds of amounts collected in excess of the ceiling price for gas sold under each contract. This has been our practice in prior proceedings under the Natural Gas Act, and on this record we see no reason, legal or equitable, to fail to return to the wholesale customers the excess sums they have paid. To the extent that any producer receives a lesser amount than our ceilings permit it is because he has agreed to prices which yield that amount or failed to file for a higher rate.

Refunds will be required only with respect to the rates which are the subject of Section 4(e) proceedings, and only for the periods during which such rates have been collected subject to refund.

A refund procedure must be established. We have determined that price adjustments corresponding to departures from standards shall be left to the parties for initial determination, if they are able to agree. The price applicable to particular gas cannot be finally determined until the parties have determined the quality of gas and the computed corresponding price adjustments. Accordingly, each producer (except small producers, who will be considered below) shall file a computation of refunds due with respect to each rate schedule within 30 days from the date of the filing of an agreement with his purchaser as to the quality of the gas sold and the cost per Mcf of processing such gas to pipeline quality standards. If no such agreement is reached the refund computation is to be filed within 30 days from the date of Commission determination of the quality adjustments. (See pp. 102-103 hereof for procedure).

277,685

— 119 —

In the case of Section 4(e) proceedings, the refund computation shall also be made for all periods during which rates were collected subject to refund. With regard to each rate schedule, such computation shall specify the applicable rate or rates as established in accordance with the principles set forth in this opinion (including

any adjustments for quality as prescribed herein), the rate or rates collected during the period subject to refund, the period during which any rate was collected in excess of the proper applicable rate, the volume of gas for which such excess rate was collected, and the amount of refunds due. Interest on such refunds (at the prevailing rate) shall be included in the computation.

Each producer will be directed to retain the refunds to be made by him until further order of the Commission. Such retention shall be in accordance with the option principle established by the Commission in *Humble Oil and Refining Company*, 32 FPC 49, Docket Nos. G-9287, *et al.*, issued July 8, 1964.

The rates for small producer sales as defined in the rule providing for small producer certificates for such sales proposed this date are not required to reflect any quality adjustments either for past periods or for the future. Small producer refund obligations will therefore extend only to refunding amounts

collected subject to refund in excess of the amounts collectible under the base ceiling rates. If a small producer wishes to take advantage of any permitted upward adjustment for new gas-well gas of high Btu content, he will be required to indicate also any offsetting deficiencies in quality of the gas in question by filing the same statements required of large producers.

SMALL PRODUCER PROBLEM

There have been many suggestions, foremost of which are those by Justice Clark dissenting in *Wisconsin* v. *F.P.C.*, 373 U.S. 294, 329-30 (1963), and speaking for the Court in *F.P.C.* v. *Hunt*, 376 U.S. 515 (1964), to the effect that this Commission should consider procedures for the exemption of small producers from regulation. There are many compelling arguments to justify distinctive treatment of small producers. The justification goes beyond the obvious benefits of relieving the small producer of the expense and burden of the regulatory process. Among other considerations, expediting the administrative process and facilitating effective regulation are suggested as additional benefits.

The examiner has set forth a well documented argument for recognizing the special problems of the small producer and affording him separate regulatory treatment. At the very heart of his analysis are two basic propositions which serve to distinguish the small producer from the large. The first is simply a recognition of the characteristic of "smallness," which as the examiner has said means that the typical small producer has limited operations and is thus subject to a greater degree of risk than is a large producer.

The examiner's second proposition is that the small producers, although numerous, account for a relatively small share of the natural gas produced in this country, and that

even without regulation they usually cannot obtain more for their gas than the regulated price we fix for the major producers. In the nation there are over 2,000 small producers as defined by the examiner, *i.e.*, those selling less than 10 million Mcf of gas per year, filing rate schedules with this Commission. They provide only about 15 percent of the total supply of natural gas moving in interstate commerce. The examiner concludes that the exclusion of the small producer from direct price control would thus have a *de minimis* impact on the consumer while the effect on the small producer would be highly beneficial. His procedural device for according exemption was a blanket finding that all the rates of the small producers were just and reasonable.

We agree with the examiner in general that special treatment of the small producer group offers scope for streamlining the regulatory process without the risk of substantial impact on consumer prices. Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators, who contribute a large share of the discoveries of new sources of gas. Easing the burdens of regulation would help to assure their continued participation in the gas production business.

While we are convinced that there is need for distinctive treatment for small producers, which we shall provide herein, we do not believe it is necessary or desirable

to provide outright exemption. We reach this conclusion assuming that exemption is legally permissible despite the mandatory language of Sections 4 and 7 of the Natural Gas Act.[49]

In our opinion the salutary objectives of those who propose exemption can better be achieved within the framework of regulation. Furthermore, any exemption for small producers would be more an illusion than a reality. As the small producers suggest, the area ceilings we prescribe will tend to set the maximum prices they can obtain for their gas.

A basic consideration in reaching our conclusion in this matter is that the impact of small producer prices on consumers is by no means *de minimis* on an area basis, and is of great impact in some situations. Sales by small producers constitute 80 percent of the gas supply of one pipeline[50] and range from 9 percent to about 60 percent

---

[49] Section 4(a) states in part that "*all* rates and charges" by "any natural gas company shall be just and reasonable." In Section 4(c) it is stated that "Under such rules and regulations as the Commission may prescribe, *every* natural gas company shall file * * * in such form as the Commission may designate, * * * *all* rates and charges * * *."

Section 7(c) provides in part that "No natural-gas company * * * shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission * * * unless there is in force with respect to such natural gas company a certificate of public convenience and necessity * * *."

[50] Kansas-Colorado Utilities Company, see F.P.C. Form 2.

of the supply of the other 25 largest pipelines. While small producers represent only 15 percent of the aggregate interstate gas supply it is obvious they are a substantial factor in the cost of the gas supply of millions of American consumers.

Another consideration which weighs with us is that penetration of rate ceilings, even on a small scale, could be seriously disruptive of a pattern of uniform area ceilings.

The examiner suggested relief for small producers from present filing requirements in the following manner: (1) a general certificate would issue to those natural gas companies which meet the qualifications of a "small producer", and (2) such producers would be required to file annual statements containing information as to their jurisdictional sales. The small producers in this proceeding support these suggestions.

We are interested in affording real relief to the small producers and in providing meaningful measures to clear our dockets and facilitate effective regulation. We recognize the burdens to small producers of complying with the filing requirements promulgated pursuant to Section 7 of the Natural Gas Act before new gas supplies can be connected. Such filings, which are routinely handled by the larger companies can, in the case of a small producer, strain his resources. The time lag, even the few weeks required under our expedited procedures, can deprive a

small producer of badly needed income. In light of these circumstances the Commission finds that it is necessary and appropriate to afford the small producers relief as provided below and we are issuing a notice of proposed rulemaking, this date, to implement our conclusions.

A small producer is thereby defined to be a natural gas company selling jurisdictionally less than 10,000,000 Mcf annually on a nationwide basis. Such a classification will include almost 250 of the filing producers in the Permian Basin and leave about 40 major companies subject to the filing requirements of Section 7 for individual sales. Nationally this breaking point would classify approximately 2,000 producers as small and about 75 as major companies. We believe that the record amply supports this reasonable classification made pursuant to Section 16 of the Act. For this purpose, the combined jurisdictional sales of affiliated companies (as further defined in the rule issued this date) will be considered as the sales of a single producer.

Companies or individuals in the Permian Basin qualifying as small producers will be granted small producer certificates pursuant to Section 7 of the Act authorizing all future small producer sales (as defined therein) in the area at or below the applicable area ceiling rate, thereby eliminating the need to obtain separate certificates for each sale as is presently required. This action will not only relieve the producers and the Commission of a large paperwork problem, it will enable small producers to bring their gas to market without any regulatory delay.

Sales in areas other than the Permian Basin by small producers will not be eligible for coverage by such certificates until an area rate is fixed therein because the determination of a specific area rate is a prerequisite for the issuance of such certificates.

All producers in the Permian Basin who apply and qualify as small producers under our proposed rule issued this date will be granted special certificates as to their Permian sales which will cover not only any future small producer sales (as defined therein) made within our area ceiling prices, but also all such sales for which a separate certificate has already been issued. Naturally, these certificates will be subject to the limit of 10,000,000 Mcf of annual jurisdictional sales on a nationwide basis and to area rate limitations. Those certificate applications within the ceiling pending before the Commission by small producers in the Permian Basin that come within the proposed rule will be covered within small producer certificates and any applications for certificates above ceiling will be granted conditionally upon acceptance of an initial price no higher than the ceiling.

Recipients of the small producer certificates will be required only to file annually a simple one-page statement in which they will state the total volume of jurisdictional

sales and certify that all such sales were within the applicable area ceiling. The producers holding such certificates will no longer be compelled to file Forms 301-A or 301-B,[51] nor will they be required to file individual initial rate schedules pursuant to Section 4(c) of the Act for the small producer sales. Furthermore, in light of our decision to accept all rate increases up to the area rate, holders of small producer certificates will not hereafter be required, under Section 4(d) of the Act, to file such changes for their small producer sales as they are made. Section 4(d) requires such filings "Unless the Commission otherwise orders * * *." We believe that inclusion of information pertaining to these changes, in the annual reports of the pipeline purchasers, will satisfy not only the language but also the purpose of Section 4(d). Of course, no increases above the applicable area ceiling will be permitted without the approval of the Commission pursuant to the filing requirements of Section 4(d).

Should a producer cease to be a small producer by virtue of an increase of jurisdictional sales to a level in excess of 10,000,000 Mcf in a year, or should he propose to sell at prices above the area rate, or should he make sales which do not qualify as small producer sales he must abide by the present requirements, *i.e.*, his certificate will not apply to such situations. Specific details of the small producer relief are explained in the Notice of Proposed Rulemaking issued this date.

---

[51] Presently required by the Regulations under the Natural Gas Act, Sections 260.5 and 260.6.

MISCELLANEOUS ISSUES

Favored-Nation and Spiral Escalation Clauses

The Presiding Examiner stated:

> . . . Most favored nations clauses and spiral escalation clauses cause price increases in a contract price to occur without reference to the circumstances or economics of the particular operation, but solely because of what happens under another contract. These clauses contravene the public interest and the basis on which prices have been determined in this decision. They are therefore declared to be inoperative and of no legal effect. No change in a rate resulting from such indeterminate pricing provisions will be permitted to take effect under this decision and order. (Initial Decision, p. 74)

The examiner correctly observed that most favored-nation clauses and spiral escalation clauses are not in accordance with the principles upon which a rate structure should be based. We have proscribed the filing of contracts containing such clauses executed on or after April 2, 1962. (Order No. 242, 27 FPC 339; *F.P.C.* v. *Texaco*, 377 U.S. 33.) We do not think, however, that such clauses in contracts already accepted for filing at the time of our order outlawing such clauses for the future should be denied effect insofar as they serve to permit filings up to the applicable area prices prescribed herein. When the contracts containing such clauses were negotiated such

clauses were a part of the bargain arrived at between the parties. Had they been proscribed at that time, escalation clauses of permissible types might well have been substituted. In any event there is no reason in the public interest to prevent rate adjustments which will permit producers to collect a just and reasonable price for their gas. These indefinite escalation clauses will, of course, like all other escalation clauses, be subject to the moratorium provisions discussed *supra* at pages 107-114 and, as the examiner ruled, such clauses will not be permitted to authorize rate filings above the applicable area rates subsequent to the expiration of the moratorium period.

277,693

— 127 —

Application of the Order

This proceeding, instituted under Section 5(a) of the Natural Gas Act, will determine the just and reasonable rates to be hereafter observed and in force for all jurisdictional sales being made under respondents' rate schedules. Such rates will apply as ceilings to all sales of respondents whether they were being made at the time we instituted this proceeding or were begun subsequent thereto. Certain of the respondents argue that our order cannot apply to rates established in contracts filed by such respondents after this proceeding was instituted. The argument has no merit. The evidence in this proceeding is based on a composite showing of the overall production in the area and fixes an area rate specifically designed to be just and reasonable for all jurisdictional sales in the area.

To hold otherwise would require an unending succession of Section 5 area rate proceedings, each covering only the sales instituted prior to the institution of the proceeding. We are not required to engage in any such massive duplication of effort. This proceeding was instituted to determine the just and reasonable rate or rates for the sales of natural gas produced in the Permian Basin subject to the jurisdiction of the Commission (Ordering Paragraph "A" of Order Instituting Hearing, 24 FPC 1121 (1960)). Consistent with the provisions of Section 5(a) of the Act, our Order will apply to all of respondents' sales in the described area. (See *United Gas Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332, 341 (1956)).

A few certificates have been issued since the institution of this proceeding authorizing sales in the Permian area by persons not respondents in this proceeding. Our Order here will not apply to these sales, but the parties making such sales will by separate order be directed to show cause why the area rates should not be applied to them.

Finally, with respect to certain of respondents' sales, increased rates have been filed subsequent to the institution of this proceeding and the dockets involving such increased rates (collected subject to refund) have not been consolidated herein. The above-stated reasons why our determination should apply to newly certificated sales is equally applicable to these nonconsolidated increased rate filings and the record in this proceeding would appear to

be adequate to determine the rates to be hereafter collected for these sales and to determine refund obligations. However, the dockets involving the increased rates were not consolidated herein and the respondents have not been afforded a hearing respecting their refund obligations. Accordingly, we shall not order refunds in these dockets but instead institute a separate proceeding requiring respondents to show cause why the rates here determined should not be utilized in determining their refund obligations.

Examiner's Witness Frazier

Continental (Brief on Exceptions, p. 78) on behalf of the Major Producer Group contends that the presiding examiner improperly called as his own witness Charles H. Frazier, then Director of Development for the Philadelphia Gas Works Division of The United Gas Improvement Company, and that he used Mr. Frazier's testimony as the basis for the dual pricing system, his pricing and location differentials, and rate design. The Major Producer Group argues that the burden of proof is the Commission's and that in the Section 5 part of the proceeding, it is well-settled that the commingling of the investigatory and adjudicatory phases of an administrative proceeding violates due process of law and the specific requirements of the Administrative Procedure Act. They note that Section 1.30(f) of our Rules, like Section 5 of the Administrative Procedure Act, provides that one engaged in the investigatory phase must not participate in the decisional process.

It should first be observed that neither Section 5(c) of the Administrative Procedure Act nor Section 1.30(f)

of our Rules by its terms applies in rate proceedings. Thus, even if it were assumed that the examiner in calling his own witness was acting in an "investigative" role, he

did not violate either the Act or the Rules. More important, however, the examiner's action was not "investigative" but a proper function of the trial examiner in a hearing. Both the Senate and House Committee Reports on the Administrative Procedure Act expressly point out that hearing officers "have the authority and duty — as a court does — to make sure that all necessary evidence is adduced."[52] The Act confers authority for what the examiner has done (see Section 7, *passim*). We also note that the state courts have approved the action of a judge in calling his own witness. *Ramsey* v. *Mading,* 217 Fac. 2d 1041 (Wash. S. Ct.); *Hunt* v. *State,* 248 Ala. 217, 27 So. 2d 186, 193; and *People* v. *Rotello,* 329 Ill. 448, 171 N.W. 540, 542. See also 9 Wigmore, Evidence 267-270; 3 Wigmore, Evidence 151-153; 4 Jones, Evidence 1685.

It is suggested that Witness Frazier may have had an interest in the proceeding because his employer, a gas distributor, though not a party in this proceeding, is an intervener in other area proceedings. This point, however, only goes to the weight to be given his testimony,

[52] Sen. Doc. No. 248, 79th Cong., 2d Sess., page 207. See also House report at page 268.

not its admissibility. If interest in the proceeding were a disqualification most of the evidence in this case would be stricken. See 4 Jones, Evidence, 1865-1966.

Witness Frazier's background and employment status were well known at the time he was called and are a matter of record. Respondents were given a full opportunity to cross-examine Frazier and to bring out anything which would impeach him either by way of challenge to his qualifications as an expert witness or challenge to his views because of his interest. His testimony, of course, is entitled to no more credence because he was called by the examiner rather than by a party. We conclude that the calling of Witness Frazier was proper and has not been shown to have resulted in any prejudice to respondents.

The Commission further finds:

(1) Each of the respondents listed in Parts I and III of Appendix A to this opinion is, and at the time of all past sales with which we are here concerned was, a natural gas company within the meaning of the Natural Gas Act and is engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption, subject to the jurisdiction of this Commission.

(2) Past, present, and proposed sales of natural gas to which the order herein applies are subject to the jurisdiction of this Commission.

(3) Rates for all sales of natural gas, by the producers in Texas Railroad Districts 7-C and 8 and New Mexico counties Lea, Eddy and Chavez which are respondents herein, that are above the applicable area rates prescribed herein, have not been shown to be just and reasonable or otherwise lawful under the provisions of the Natural Gas Act and should be disallowed, and refunds should be required as hereafter provided.

(4) The just and reasonable rates for past, present and proposed sales of natural gas to which this order applies are the applicable area rates set forth in ordering paragraphs (A) and (B) below.

(5) It is necessary and appropriate and in the public interest to establish minimum rates as provided in ordering paragraph (G) for all natural gas produced in the Permian Basin.

(6) Contracts providing for rates in excess of the applicable just and reasonable rates determined herein or below the minimum rates herein established are in that respect unjust and unreasonable.

(7) The moratorium until January 1, 1968, upon the filing of price increases above the just and reasonable rates established herein is necessary to the practical administration of area rate ceilings and the effective price regulation of natural gas producers.

(8) Except as herein granted the exceptions to the initial decision and proposed order should be denied.

The Commission orders, pursuant to Sections (4e) and (5a) of the Natural Gas Act

(A) *The Base Area Rates*

The following base area rates are hereby established, as of the effective date hereinafter defined, as the just and reasonable rates for sales of gas for resale in interstate commerce by the respondents in this proceeding, subject to any applicable adjustments for quality as provided in ordering paragraph (B) hereof:

(1) For new gas-well gas, as defined in this opinion, sold and to be sold pursuant to contracts executed on or after January 1, 1961, and any residue gas derived therefrom:

a. In Texas Railroad Districts No. 7-c and 8 — *16.5 cents per Mcf* (at 14.65 psia).

b. In Lea, Eddy and Chaves Counties in New Mexico — *15.5 cents per Mcf* (at 14.65 psia) plus the applicable state and local production taxes in effect on the effective date hereinafter defined.

(2) For gas-well gas, sold and to be sold pursuant to contracts executed before January 1, 1961, and any residue gas derived therefrom, and for all casinghead gas and any residue gas derived therefrom sold and to be sold:

a. In Texas Railroad Districts No. 7-c and 8—*14.5 cents per Mcf* (at 14.65 psia).

b. In Lea, Eddy and Chaves Counties in New Mexico—*13.5 cents per Mcf* (at 14.65 psia) plus the applicable state and local production taxes in effect on the effective date hereinafter defined.

(B) *Quality Standards and Adjustments to the Base Area Rates*

(1) The base area rates fixed in ordering paragraph (A) herein shall be adjusted for any deviations from the standards for pipeline quality gas in Texas Railroad Districts Nos. 7-c and 8, and in the New Mexico counties of Lea, Eddy and Chaves, which are hereby established as follows:

a. *Carbon Dioxide:* Pipeline quality gas shall contain not more than 3 percent carbon dioxide by volume.

b. *Hydrogen Sulphide:* Pipeline quality gas shall contain not more than 10 grains of hydrogen sulphide per Mcf of natural gas at 14.73 psia and 60° F.

c. *Total Sulphur:* Pipeline quality gas shall contain not more than 200 grains of total sulphur per Mcf of natural gas at 14.73 psia and 60° F.

d. *H_2O:* Pipeline quality gas shall contain not more than .009 pound of H_2O per Mcf of natural gas at 14.73 psia.

e. *Other Impurities:* Pipeline quality gas shall contain no oxygen, dirt, dust, gum, or other impurity in sufficient amounts to require the buyer to incur processing costs to eliminate such im-

purities in order for the gas to meet either customary commercial standards or the customary requirements of any of the interstate pipelines in the area.

f. *Pressure:* Pipeline quality gas shall be delivered at a pressure of not less than 800 pounds per square inch.

g. *Btu Adjustment:* (For new gas-well gas only). The maximum standard will be 1,050 Btu's per cubic foot at 14.73 psia and 60° F. and the minimum standard will be 1,000 Btu's per cubic foot at 14.73 psia and 60° F. Upward and downward

adjustments of the base area rates will be permitted on a proportional basis as specified at pages 99-100 of this opinion if the Btu content exceeds the maximum standard or is below the minimum standard.

(2) When a purchaser buys gas which deviates from the quality standards established in subparagraph (1) above, the base area rate fixed in ordering paragraph (A) shall be adjusted for any deviations from such standards as follows:

a. The applicable base area rate shall be adjusted downward by the net cost of processing the gas to bring it up to standard.

(i) If the processing is performed by the purchaser, a reasonable return upon the net investment should be included as part of the processing cost incurred in bringing the gas up to pipeline quality.

(ii) If processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

b. The applicable base area rate for new gas-well gas only shall be adjusted downward or upward by the amount of any applicable Btu adjustment and by the concomitant amount of any saving or additional expenses to the seller from any reduction or increase in taxes or royalty payments resulting therefrom.

(C) Applicable area rate, as that term is used herein, shall mean the base area rate established by ordering paragraph (A) or the rate determined after adjustment, if any, of that base area rate for the deviations from the quality standards established by ordering paragraph (B).

(D) The applicable area rate as defined in ordering paragraph (C) above, shall be effective from and after the effective date hereinafter defined and any amounts collected in excess thereof from and after such effective date shall be subject to refund plus interest at 7 percent. In addition,

with respect to the rates involved in the Section 4(e) proceedings set out in Part III of Appendix A, the applicable area rate as defined in paragraph (C) above, shall be effective from the date such Section 4(e) rates were collected subject to refund and all amounts collected under those Section 4(e) rates in excess of the applicable area rate shall be subject to refund from the date such excess was collected plus interest at the rate

specified in the respective Section 4(e) proceeding, in accordance with the provisions of ordering paragraphs (I) and (J) herein.

(E) Within 45 days from the effective date hereinafter defined each respondent shall file a supplement to each applicable rate schedule, effective as of the effective date hereinafter defined, reflecting any reductions required to bring any or all of its rates into conformity with the applicable base area rate established by ordering paragraph (A) herein.

(F)(1) Within 90 days from the effective date hereinafter defined, each respondent listed in Part I or Part III to Appendix A (except those exempted by subparagraph (3) hereof) shall file with the Commission a statement in conformity with Appendix D to this opinion for each rate schedule such respondent has on file with this Commission for the sale of natural gas produced or sold within Texas Railroad District No. 7-c, Texas Railroad District No. 8, or the New Mexico counties of Lea, Eddy or Chaves. Such statement shall set forth either that the gas accords with all pipeline quality standards established herein, or in which respects the gas deviates from the particular quality standards established herein; the agreed cost to the purchaser of processing the gas to bring it to the pipeline quality standards established herein with respect to each quality deviation; any upward or downward Btu adjustment for new gas-well gas; and the resulting applicable area rate for the gas. Such statement shall be signed by both the seller and the purchaser. If the seller and the purchaser

are unable to agree upon any or all of the particulars entering into the computation of the applicable area rate, the seller shall file the statement herein required which shall indicate the absence of agreement and supply the information required to compute the applicable area rate as well as the contentions of the parties with respect to the quality and amount of the adjustment for any item in dispute. The purchaser may file a separate statement setting forth its views within the period herein provided.

(2) The statement filed hereunder which reflects full agreement between seller and purchaser shall be deemed accepted by the Commission unless the Commission, within 60 days after such filing, shall otherwise order. In the event of disagreement between the seller and purchaser or, where the Commission otherwise determines that the statement filed is inconsistent with the provisions of ordering paragraph (B) herein, the Commission will, after appropriate proceedings, prescribe the applicable area rate to be applied as of the effective date hereinafter defined.

(3) Any respondent listed in Part I or Part III to Appendix A is exempt from filing the statement required by subparagraph (1) hereof for any sales which are "small producer sales" as defined in the rule providing for small producer certificates proposed this date, if within 45 days from the effective date hereinafter defined such respondent files the information requested in Appendix E to this

opinion required to qualify for a small producer certificate for such sales. If the Commission subsequently finds that such a producer does not qualify as a small producer such applicant shall be required to file the statement required by subparagraph (1) hereof within 90 days after any such Commission finding.

(G) *Minimum Rates*

(1) Minimum rates for natural gas produced in the Permian Basin area are hereby established as follows:

For gas meeting all pipeline quality standards *9 cents per Mcf* at 14.65 psia.

For gas not meeting all pipeline quality standards as established herein *9 cents per Mcf* reduced by the amount of any adjustments for quality as provided in ordering paragraph (B).

(2) All respondents who are currently making sales subject to the jurisdiction of this Commission and produced in Texas Railroad District No. 7-c, Texas Railroad District No. 8, or any of the New Mexico counties of Lea, Eddy or

Chaves, are hereby authorized to apply for increases to the minimum rates fixed in subparagraph (1) hereof. Such applications shall be accompanied by the information required in Appendix D to this opinion, signed by the seller (or the agent or operator). Increases to the established applicable minimum rate will be granted notwithstanding

contractual provisions to the contrary which are hereby modified *pro tanto*.

(H) *Moratorium on Rate Increases*

No respondent listed in Part I and Part III of Appendix A to this opinion shall file any change in rate providing for a price in excess of the applicable area rate prior to (1) subsequent order of the Commission in this proceeding permitting such filing or (2) January 1, 1968, whichever is earlier. All contracts of the respondents listed in Part I of Appendix A relating to sales of natural gas subject to the jurisdiction of this Commission and produced in Texas Railroad District No. 7-c, Texas Railroad District No. 8, or any of the New Mexico counties of Lea, Eddy or Chaves shall be deemed amended, pursuant to Section 5(a) of the Natural Gas Act, by the inclusion of the following language:

> From the effective date of the order of the Federal Power Commission in the Permian Basin Area Rate Proceeding, AR61-1, (therein defined as September 1, 1965), until January 1, 1968, no increase in rates may be filed, except in compliance with a specific order of the Commission for a rate in excess of the applicable area rate as determined pursuant to said proceeding or pursuant to later order of the Commission.

(I) *Refund Reports*

Within 120 days from the effective date hereinafter defined a refund report shall be filed with this Commission in triplicate by each respondent involved in one or more of the Section 4(e) proceedings set out in Part III of Appendix A to this opinion. The report shall set forth

the following information (if more than one rate schedule is involved the respondent shall supply the information for each schedule separately):

(i) The rate collected during the period subject to refund, and the periods during which each rate was collected.

(ii) The volume of gas sold at each such rate.

(iii) The difference between the total amount collected during the period subject to refund and the applicable area rate as defined herein. If seller and buyer do not agree upon the items necessary to the computation of said rate, the seller shall make this computation on the basis of the information supplied by the seller in the statement required by ordering paragraph (F) subject, however, to the terms of subparagraph (2) thereof.

(iv) The interest, at rates as specified in each Section 4(e) proceeding, on the amount collected during said period in excess of the applicable area rate. The interest shall be calculated to the date of the report.

(J) *Treatment of Refunds*

Each respondent shall retain the amounts shown in the report required under ordering paragraph (E) subject to further order of the Commission directing the disposition of those amounts. If a respondent elects to commingle these retained refunds with its general assets and use them for its corporate purposes, and after notice to the Commission it is specifically authorized so to do, it shall pay

interest thereon at the rate of 4.5 percent per annum on all funds thus available from the date of the filing of the refund report to the date on which they are paid over to the person ultimately determined to be entitled thereto in a final order of the Commission. If a respondent elects to deposit the retained refunds in a special escrow account, the respondent shall tender for filing on or before the date of the filing of the refund report an executed Escrow Agreement, conditioned as set out below accompanied by certificate showing service of a copy thereof upon each of its jurisdictional customers. Unless notified to the contrary by the Secretary within 30 days from the date of filing thereof, the Escrow Agreement shall be deemed to be satisfactory and to have been accepted for filing. The Escrow Agreement shall be entered into between respondent and any bank or trust company used as a depositor for funds of the United States Government and the agreement shall be conditioned as follows:

277,704

— 138 —

(1) Respondent, the bank or trust company, and the successors and assigns of each, shall be held and formally bound unto the Federal Power Commission for the use and benefit of those entitled thereto, with respect to all amounts and the interest thereon deposited in a special escrow account, subject to such Agreement, and such bank or trust company shall be bound to pay over to such persons or persons as may be identified and designated by final order of the Commission and in such manner as may

be therein specified, all of any portion of such deposits and the interest thereon.

(2) The bank or trust company may invest and reinvest such deposits in any short-term indebtedness of the United States or any agency thereof or in any form of obligation guaranteed by the United States which is respectively payable within 120 days as the said bank or trust company in the exercise of its sound discretion may select.

(3) Such bank or trust company shall be liable only for such interest as the invested funds described in Paragraph (2) above will earn and no other interest may be collected from it.

(4) Such bank or trust company shall be entitled to such compensation as is fair, reasonable and customary for its services as such, which compensation shall be paid out of the escrow account to such bank or trust company. Said bank or trust company shall likewise be entitled to reimbursement for its reasonable expenses necessarily incurred in the administration of this escrow account, which reimbursement shall be made out of the escrow account.

(5) Such bank or trust company shall report to the Secretary quarterly, certifying the amount deposited in the trust account for the quarterly period.

277,705

— 139 —

(K) No respondent shall file hereafter any change in rate providing for a price in excess of the applicable area

where the contractual right to such filing is based upon any contractual provision which would not be permitted by subsections (a), (b) and (c) of Section 154.93 of the Regulations under the Natural Gas Act.

(L) Notwithstanding the issuance of this final order, these proceedings shall remain open for such further action as may be necessary with respect to individual respondents and such other action as may be necessary in the premises.

(M) Except as herein granted the exceptions to the initial decision and proposed order are hereby denied.

(N) The date of issuance of this opinion and order within the meaning of Section 19(a) of the Natural Gas Act is the date shown on page one of the opinion immediately below the title thereof. The term "effective date hereinafter defined" (as it is used in the ordering paragraphs herein) is September 1, 1965.

By the Commission. Commissioner O'Connor filed a separate statement concurring and dissenting on limited issue.

Commissioner Ross filed a separate statement concurring and dissenting on limited issue.

(SEAL)

Commissioner Black filed a separate statement concurring.

Commissioner Bagge not participating.

Area Rate Proceeding Claude E. Aikman, *et al.* North Central Oil Corporation, (Operator), *et al.*	Docket Nos. AR61-1 G-18466, *et al.* CI60-435, *et al.*

O'CONNOR, Commissioner, *concurring and dissenting on limited issue:*

(Issued August 5, 1965)

The Commission's decision issued today is a significant event in the evolution of our area rate policies, and, on the basis of the record before us, it establishes just and reasonable rates for natural gas producers in the Permian Basin. It is my opinion that our extensive investigation has been synthesized into a meaningful system of regulation, and, for the purposes of our initial area proceeding, I endorse the consideration of costs. The cost analysis we utilize is a useful and proper determination of the financial requirements of the industry, and the results are defensible. I therefore concur in the Commission's opinion, including, of course, the procedures for implementation of the rates we establish; my dissent is limited to one issue.

While I join for present purposes, I am convinced that the experience gained in this costly and expansive proceeding justifies a simplification of the trial and disposition of future area proceedings. Price control being our objective, it is clear that the interests of producers and consumers can be adequately protected under expedited procedures based upon reasonable market prices. The record in this case fully establishes that the contract price

CARD 12

at which most producers are able and willing to operate is just and reasonable. This standard provides the measure of inducement that has been successful in providing an excellent source of energy for use in all sectors of the Nation. Thereby, any policy that focuses on profits realized, as recommended by some parties before us, would be avoided, and the focus would be on supply elicited, which policy we here endorse. Furthermore, it is preferable to tolerate such imperfections as might result from area regulation in the interest of avoiding complicated cost-plus methodology.

The contract price is the measure of inducement. Composite costs best serve as a check on average field prices to preclude significant price departures. Our judgment should rest primarily on the market place where we can rely on competition to determine just and reasonable rates. In the hope that they will become the rule, I hereby express my additional views and recommendations.

277,707

PRELIMINARY CONSIDERATIONS

In 1954 the Supreme Court made the unexpected determination that this Commission has jurisdiction over the interstate sales of natural gas producers and that it has a corresponding obligation to regulate those sales in the public interest. For fourteen years prior to that decision the Commission had repeatedly rejected the jurisdictional argument, and, due to the obvious difficulty of the task, the Commission had regularly recommended legislation

granting only limited regulation over producers. In 1956 the Congress acquiesced in this view by approving such legislation, only to see it rejected by Presidential veto for reasons totally removed from the merits of the bill itself. Today, more than a quarter-century after the Natural Gas Act was adopted, and eleven years after this Commission was granted jurisdiction over producer sales, a decision has been reached which accommodates to an intent that prices for natural gas be regulated. However, although the law compels an embarkation into price control during peacetime, it does not dictate a single methodology, and herein lie my separate recommendations for future area decisions.

The task of selecting a reasonable approach to regulation that will reflect the practical necessities before us is a difficult one, but cognizance of several factors will make an acquittal of the duty more meaningful. The production of natural gas is an industry in which there is an intricate interplay of special market circumstances. Pipeline control over field prices presents awesome monopsonistic powers. Problems of waste and correlative rights compel state conservation regulation. Shared problems with oil lead to an overlapping of economic interests. Public utility characteristics at the transmission and distribution end go so far as to generate demands for price controls over the producing industry. The absence of traditional public utility characteristics in the production of natural gas presents problems that are directly antithetical to the transmission or distribution of the commodity; there is not the same direct relationship between investment and

output at the crucial focus of the individual company, and there is certainly no legal obligation to provide new services. Reflecting these multifarious consideration, Justice Jackson observed, "If natural gas rates are intelligently to be regulated we must fit our legal principles to the economy of the industry and not try to fit the industry to our books." *F.P.C. v. Hope Natural Gas Co.*, 320 U.S. 591, 650 (1944). In that opinion he emphasized,

> It is necessary to a "reasonable" price for gas that it be anchored to a rate base of any kind? Why did courts in the first place begin valuing "rate bases" in order to "value" something else? The method came into vogue in

> fixing rates for transportation service which the public obtained from common carriers. The public received none of the carrier's physical property but did make some use of it. The carriage was often a monopoly so there were no open market criteria as to reasonableness. The "value" or "cost" of what was put to use in their service by the carrier was not a remote or irrelevant consideration in making such rates. Moreover, the difficulty of appraising an intangible service was thought to be simplified if it could be related to physical property which was visible and measureable and the items of which might have market value. The court hoped to reason from the known to the unknown. But gas fields turn this method topsy turvy. Gas itself is tangible, possessible, and does have a market and a price in the field. The value of the rate base is more elusive than that of gas. It consists of intangibles — leaseholds and freeholds — operated and unoperated — of little use in themselves except as rights to reach and capture gas. The value lies almost wholly in predictions

> of discovery and of price of gas when captured, and bears little relation to cost of tools and supplies and labor to develop it. Gas is what Hope sells and it can be directly priced more reasonably and easily and accurately than the components of a rate base can be valued. Hence the reason for resort to a roundabout way of rate base price fixing does not exist in the case of gas in the field: 320 U.S., 647-48.

Regulatory authority must be employed as the characteristics of the industry dictate. Congress and the courts have refused to confine permissible principles of procedure to a narrow corridor; by granting the Commission flexibility, they implicitly recognized the wisdom of the Justice's words.[1]

By these distinct considerations, the purpose and the method of price regulation is presented in its proper perspective, and they should dictate the results required. Where a compulsory service obligation exists the only regulatory problem is to appraise a service that must, of legal necessity, be rendered. Where the output is direct and constant, the value of the service thus performed, in terms of the allowed rate, can legitimately be referenced to a reasonable yield on the actual costs involved. In the absence of this obligation, however,

the role of appraising the services performed assumes a decidedly different function: the problem becomes that of

[1] See, e.g., *Wisconsin* v. *F.P.C.*, 373 U.S. 294 (1963); *Colorado Interstate Gas Co.* v. *F.P.C.*, 324 U.S. 58 (1945); *F.P.C.* v. *Natural Gas Pipeline Co.*, 315 U.S. 575 (1942); *Bel Oil Corp.* v. *F.P.C.*, 255 F.2d 548 (5th Cir. 1958); *Forest Oil Corp.* v. *F.P.C.*, 263 F.2d 622 (5th Cir. 1959).

fixing a price based, not only upon what must be performed, but primarily upon what will induce the product. The regulatory emphasis shifts. It is not so much actual cost as it is market cost; not only prudent return but incentive prices; not just cost of service but also cost of supply. These multifarious considerations are so well established that there should be no need for further discussion. They were made explicit in our decision to focus on area rate-making and have been consistently reaffirmed. *Phillips Petroleum Company* 24 F.P.C. 537, 542-548 (1960); *aff'd*, 373 U.S. 294, 308-310 (1963). That decision compels thorough consideration of the factors that determine a reasonable market price.

It has been argued that *en masse* cost proceedings contain an inherent incentive for low cost producers since their profits are limited only by ceilings premised on much higher costs. Group cost proceedings may offer more incentives than individual proceedings, but if the history of pipeline production and its regulation by this Commission on an individual cost basis is any indication, cost regulation as a general principle in utility regulation does not provide the necessary system. By such control, there has been a 25 per cent decrease in the ratio of actual pipeline production over a six-year period: in 1957, pipeline production was 11.69 per cent of purchases; in 1958, 10.56 per cent; in 1959, 10.87 per cent; in 1960, 10.38 per cent; in 1961, down to 9.57 per cent; and in 1962, only 8.78 per cent. See *Sales by Producers of Natural Gas to Natural Gas Pipeline Companies* (F.P.C. 1963). These statistics are for individual companies as composited on an annual basis.

It has also been argued that, if total industry costs plus a reasonable return are recovered, then gas will continue to be found. Total costs are not recovered under group cost regulation; the higher cost producers, which must be considered in any statistical compilation, will still not be made whole. Moreover, gas is found by the individual decisions and acts of thousands of producers. To them, incentives must relate to profits available in other sectors of the economy. If the maximum price any one producer can obtain from his production is insufficient, as he might determine *vis-a-vis* his own interests and alternative investments, it is of little concern to him that the ceiling was premised on the larger percentage of the industry's costs. So long as there is a reasonable likelihood that his prices will be reduced below his contract terms or his certificate conditions, he will not have the necessary incentive to commit funds for further exploration.

277,710

I emphasize, in full agreement with our opinion, that the area rates we are to determine have a single, overriding purpose: to control the available supply of natural gas; and those rates have but one utilitarian function: to be high enough, but only high enough, to accomplish this policy function. In the context of area pricing, just and reasonable rates can best be used as a measure to elicit the necessary supply. So viewed, price control is the overriding policy. The function should be accomplished, and the standard should be employed, in the most direct and least dilatory manner possible.

REGULATION BASED SOLELY ON COSTS

The Commission places primary reliance for its answer in this initial case upon cost-plus regulation. This accepted formulation is little more than individual cost of service applied on an area basis to an averaging of composite costs. In making this determination, we must grapple with Gordian problems that do not readily accommodate to precise disentanglement; for our purposes here, cost analysis defies mathematical logic. Nevertheless, the focus in this proceeding on such costs make it both necessary and proper that we determine the financial requirements of the industry.

Costs as a Basis for Comparison

The major emphasis in the Commission opinion on cost-plus regulation appears to stem from a conviction that costs *must always* be the primary basis for regulation. I believe we have more flexibility, particularly for future proceedings, than is suggested there. The leading authority on this issue is *F.P.C.* v. *Hope Natural Gas Company,* 315 U.S. 575, where the Supreme Court declared:

> It is not the theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust or unreasonable, judicial inquiry is at an end. The fact that the method employed to reach that result may contain infirmities is not then important.

The tenor of the above quotation supports the general proposition that regulatory agencies are to be accorded a strong presumption of validity in determinations that

must be based largely on commission expertise. Certainly producer regulation qualifies as a subject matter in which there should be large scope for Commission innovation and adaptation to the economic facts of life in the industry. The Commission opinion, in my view, charts too narrow a course for the future. Cases such as *City of Detroit* v. *F.P.C.*, 230 F. 2d 810 (1956), where the D. C. Circuit Court

reversed a Commission determination which would have allowed a pipeline the field price for its purchases of natural gas from an affiliated producer, do not bind us to costs alone. The Commission had there sought to avoid the complicated and time-consuming "rate-base" method, which is presently relied upon for the flowing gas price albeit on an area basis. The circuit court reversed, holding that the purposes of the Natural Gas Act require that costs be considered; however, the opinion emphasized that this was to be regarded as no more than a starting point. Thus, the Court there stated:

> . . . though we hold that method [the rate base or cost of service method] not to be the only one available under the statute, it is essential in such a case as this, that it be used as a basis of comparison. It has been repeatedly used by the Commission, and repeatedly approved by the courts, as a means of arriving at lawful — "just and reasonable" rates under the Act. Unless it is continued to be used at least as a point of departure, the whole experience under the Act is discarded and no anchor, as it were, is available by which to hold the terms "just and reasonable" to some recognizable meaning.

The above language was relied upon by the Fifth Circuit in another proceeding, *Bel Oil Corporation* v. *F.P.C.*, 255 F. 2d 548 (1958), where that court was faced with an allegation by certain producers that the Commission should base just and reasonable rates on field prices. The court rejected this contention, saying:

> We cannot agree [to] the proposition that the evidence thus far adduced makes out a *prima facie* case of reasonableness of the contract price of 16 cents. We do not hold that the evidence of field price is irrelevant. We do hold that evidence of unregulated prices in the field is not sufficient to warrant a finding by the Commission that a price comparable to them is just and reasonable within the intendment of the Natural Gas Act. *Id.*, at 553.

The Court further observed:

> The regulation of the prices at which thousands of "natural gas companies" may sell to the pipeline companies is a difficult one at best. It is a field which in many respects requires new formulas to test what is just and reasonable.

277,712

Rebutted in efforts to rely solely on contract prices, the Commission commenced the seemingly interminable task of determining just and reasonable rates to be allowed on an individual company cost of service basis for the country's major producers of natural gas. Realizing the futility of the individual cost approach, the Commission made the necessary determination that area rates be utilized. Significantly, the decision marked a step away from the individual company costs; the emphasis shifted to other economic indicia. New formulae for public util-

ity regulation were necessary. It became possible under area pricing that some producers might not be able to operate under ceilings; it also raised the possibility that many producers would receive high rates of return simply because of the success of their operations. The departure signalled the demise of cost-plus regulation for natural gas producers. Recognition was accorded the fundamental difference that exists between the producer of a commodity and the seller of a service. The latter is readily amenable to utility regulation; the former clearly is not. Significantly, the same court that decided *City of Detroit* affirmed the departure from costs in the *Second Phillips* litigation. In 303 F. 2d 308 (D.C. Cir. 1961) Chief Judge Prettyman, author of *City of Detroit,* declared:

> . . . But what of a fair price for a commodity bought and sold by a merchandiser? Almost the whole of the economics of merchandising differs from the economics of public utility service. Are the just and reasonable prices of such a merchandiser limited to fair returns on his own investment and prices paid by him (and, if so, what investment and what prices), or are those prices reasonably measured by the fair prices for the product as measured by the open competitive market for the product, evaluated by Commission expertise and data on the whole of the market operation? Either criterion is a method of regulation. It seems to us that the choice must lie with the Commission. *Id.,* at 388.

In turn, the Supreme Court affirmed the area approach, 373 U.S. 294 (1963). Significantly, it there declared:

> We recognize the unusual difficulties inherent in regulating the price of a commodity such as natural gas. We respect the Commission's considered judg-

> ment, backed by sound and persuasive reasoning, that the individual company cost-of-service method is not a feasible or suitable one for regulating the rates of independent producers. We share the Commission's hopes that the area approach may prove to be the ultimate solution. *Id.*, at 310.

277,713

Although repeating assurances at oral argument that "composite cost-of-service data" would be considered, the Court went on to say that *City of Detroit*, insofar as it required cost regulation, is to be distinguished from area pricing because the circuit court did not have before it any questions relating to the area rate method. This precedent leads inexorably to the conclusion that, even though some consideration of costs may be required for an initial area pricing formula, the cost approach need not, in circumstances of workable competition, be the governing methodology. Nevertheless, five years after the area approach was initiated in *Second Phillips*, and over twenty years after the Court observed that "he who would upset the rate order under the [Natural Gas] Act carries the heavy burden of making a convincing showing that it is invalid because it is unjust and unreasonable in its consequences." . . . *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591, at 601 (1944), this Commission retains its attachment to cost-plus. In the light of compelling authority, it must be concluded that fears of judicial review need not be entertained to preclude Commission departure from strict adherence to cost-plus. In this proceeding there has been an extensive investigation into the operations of producers, with all parties having received a thorough opportunity to

present their separate views and to review the evidence presented by others. Beyond a doubt, with due consideration being accorded the many difficulties inherent in any cost analysis of a joint product, it is clear that the prices adopted today bear a close and substantial relation to the weighed average prices negotiated in the field. The cost-plus rate and the negotiated contract rate fall within that zone of reasonableness that is essential to regulation. Therefore, it is not required in future proceedings that costs be the beginning and the end of just and reasonable rates. The time is ripe to abandon costs as the sole referential. Among the alternatives, competition has been shown to be sufficient to provide an appropriate and compelling measure of just and reasonable rates.

Inherent Limitations in Cost-plus Regulation

Cost-plus regulation alone is not an objective, independent determinant for just and reasonable prices for producers. Any determination upon evidence of costs will necessarily depend on numerous pragmatic adjustments that will, without consideration in detail of other relevant factors, permit a certain amount of variation that could otherwise be controlled. It is no difficult matter to appreciate the problem. Staff concedes that "costing for producers of gas is not, and likely never will become, as precise as is customary in utility regulation." The major inherent difficulties are fourfold.

Fundamentally, the factual and statistical presentations relied upon in the main opinion are but estimates. There

are immense difficulties in the collection, selection, and presentation of data. Voluminous questionnaires are issued, but many go unreturned. Staff Appendix data in the largest of the five size categories is based on 93.8 per cent of the producers. In the next largest group only 30.9 per cent are available. The percentages are dropped drastically to 8.0 per cent in the third group, to 2.7 per cent in the fourth, and to but 0.8 per cent in the smallest. Although the excellent response in the largest category does provide good area cost coverage, there is a notable exception by the absence of crucial exploratory drilling costs. Specifically, unrecorded dry holes are of necessity incomplete. Any meaningful anticipation of probable accuracy is weakened by an absence of fully reliable statistical verity. Perhaps these deficiencies could be cured in the future, but the precipitous decrease for available questionnaire data on the small producer groups presents more fundamental problems, particularly since the small producers drill the greater proportion of exploratory wells. The smaller producers operate on extremely limited resources and are thus less likely to maintain books that would be adequate to provide meaningful replies. While 67 of 68 Appendix B questionnaire responses for the second largest group are acceptable for compositing purposes, 46 of the 105 Appendix C responses were inconsistent or incomplete to the extent that their data was entirely excluded. Consequently, as sales and production volumes decrease data credibility likewise decreases. Exhibit 255, among others, indicates there is an exact inverse relationship between sales volumes and per unit costs; as the former decrease, the latter increase. This statistical inac-

curacy means that primary reliance on questionnaire data places the small producer — the one most likely to be undercut through *enmasse* normative costing — in a triple squeeze: due to the high cost of compilation, a low percentage can submit cost data; a high percentage of the data submitted must thus be rejected; and such responses as finally filter into a composite exhibit must be discredited for low coverage on a voluntary basis.

Despite these inherent deficiencies, the issuance of the questionnaires is not inutile. To the contrary, their submission has been of notable assistance in arriving at rates which are just and reasonable, and in establishing, as evidenced in our opinion, that negotiated field prices are within the permissible zone of reasonableness, even from a cost perspective.

Of necessity, the Commission had to supplement questionnaire data by amplifying the information available from various published sources. Although this reinforces some aspects of

data reliability, other problems arise in proportion. The separate publications are usually limited to the very large operators, and are thus even more restricted than under the questionnaire responses. Coverage of these outside sources is usually national and international, so that expenditures are presented in broad categories that portray many meaningful items in a single dollar total; consequently, specific cost items that should require special regulatory treatment cannot be separately identified for

the Commission's purposes. As various sources are necessarily utilized, approximation of these unknown components is effectively prevented by the obscure or overlapping categorizations used by each source. Statistical probability thus declines and, although such cost analysis provides a "zone of reasonableness" within which the required pragmatic adjustments can properly be made, there is no precise objective standard for the purposes of the industry.

After the cost components are adopted, the circular ceremony known as cost allocation begins. We have avoided some of the pitfalls, but our reliance on even the semblance of allocation requires that we exercise our judgment within a fairly broad range of rates. By definition, allocations occur because certain costs cannot be directly identified with certain functions of the various identifiable products or assets, and allocated costs thus present a distinct existence apart from directly ascertainable costs. Where the ratio to total industry costs is small, the gaps are insignificant; however, as the ratio increases, both the costs and the resulting rates, to the extent directly transferred, become less reliable and more subject to adjustment. As the speculative base becomes more pronounced, the choice of allocation formulae can produce a wider range of rates, but the logical relationship between any resulting rate and the current costs of supply becomes even more remote. Although the courts may have declared that "It is not the theory but the impact of the rate order which counts," I do not believe that merely because the results reached today are reason-

able and have a valid reference to the prevailing market price at the well-head that cost-plus should be employed in the future as the sole referential. The imprecise determinations can only be a transcendent command unduly complicating later proceedings, and the analytic principles evoked can have but the validity of a foregone conclusion.

The difficulties involved in allocations are not hard to appreciate. The allocations problem confronted by the Commission is that of attributing legitimate, but separate, costs to a largely joint product. According to witness Sherwin,

277,716

the costs attributable to associated gas are 100 per cent joint, as that term is technically employed, and, for non-associated gas, 31 per cent joint and 24 per cent shades of joint and common. Thus, even for non-associated gas, only 45 per cent of the costs are directly attributable to the product committed to our jurisdiction. The Commission has previously stated the implications of this:

> While we must make allocations in all rate cases, the amounts involved in electric and gas pipeline cases have been comparatively small, and the allocations relatively simple. In the case of a producer, the amounts involved in the allocations of costs are major in size and extremely difficult to make. The result is that a producer actually could become bankrupt, or could make enormous profits, depending merely upon the methods of allocation used. 24 FPC, at 543-544.

Strict adherence to allocation formulae would produce a spectrum of rates so wide and variant as to lend a sophist's support for the extremes, and as a practical matter to be capable of producing clearly unrealistic results. In such a case, as well as in the case of prescribed rates that come to rest somewhere between the extremes, the supposedly independent determination of legitimate costs is actually based upon pragmatic adjustments of either the formulae employed or, in a guise of expertise and trending, of the deceptively precise mathematical resultants. This certainly is no well-guarded secret:

> When an unrealistic result is reached, the formulae for allocations must be changed, in order to bring about a reasonable result. The allocation methods then become a means of supporting a result already arrived at, rather than a means of arriving at a result which was previously unknown. *Id.*, at 544.

Finally, even after statistical costs are collected, compiled, selected, allocated, and invariably trended and modified, they must still be related to reserve additions before the desired costs per Mcf can be found. An understatement of reserves found causes high per unit costs, and thus results in high rates. An overstatement has the reverse results. Despite the confidentiality attached by producers to their reserve figures, the industry's cooperation in this proceeding prompted them to submit a composite exhibit of estimated reserves for the Permian Basin. In addition, there are numerous published sources for reserves estimates. Nevertheless, such figures are no more than estimates, and their estimation entails a considerable degree of subjectivity. This is revealed on the

record before the Commission as was similarly disclosed in the investigation into Phillips' individual costs. See 24 FPC, at 544.

The statutory function of rate regulation is to arrive at reasonable results, and no criticism can be levelled at the attempt to stay within a zone of reasonableness. The use of composite figures to explain economic behavior is clearly a most useful analytic system; however, reliance on allocations, estimates, and other variations of expertise are not the only independent referentials that are desired or that can be utilized.

To the extent that cost analysis is productive of reasonable results, and with one exception our opinion today meets this judicial standard, it would be most helpful for our regulatory purposes if ascertainment of a producer's investment were to be presented on a basis conforming to sound accounting practices. The derivation of a return allowance is a three-step computation: first, ascertainment of the investment; second, determination of the period of time over which the investment is to be allowed a return; and, third, ascertainment of the rate of return. I concur in the Commission's determination on this issue because, on the record in this case, no other disposition is feasible. However, it appears that the yield concept deserves full consideration in future proceedings as a reasonable alternative that might be preferable to traditional methods.

In a 1963 publication by Arthur Andersen & Company, entitled *Accounting for Oil and Gas Exploration*

Costs, it is concluded that the present practice of the industry of expensing exploration and development costs as incurred is in discord with accounting and economic principles. Written for the limited purpose of discussion and study, the publication recommends that leasing, acquisition, carrying, drilling, geological, and other such costs, as well as general and administrative costs related to exploration and overhead, be capitalized and later amortized on an overall unit-of-production basis as production occurs. It states, "[s]uch aggregate costs include nonproductive exploration costs which, in our opinion, are capital in nature," and later, "[t]hey should be capitalized since they are just as much a part of the cost of the reserves found as are the lease and well equipment on the producing wells." The pamphlet recognizes, however, that ". . . appropriate recognition should be given to such current reductions in income taxes as may result from the current deduction of such capitalized costs for income taxes as incurred. This is essential to a proper determination of costs."

The recommendation in the pamphlet may also be sound for regulatory purposes. At least, as recommended by Staff witness

Spain, that portion of it which advocates full cost accounting for all finding expenditures should be thoroughly explored. Any lesser treatment is a refusal to recognize the full cost of acquiring productive assets. Such cost accounting has been undertaken on a very limited basis by the industry, and it appears that the results have pro-

vided more accurate knowledge of the functioning of the industry and of the results of expenditures. Without going into detail at the present, I believe the true yield method may be shown not to change the rates here established. In any event, it is not possible to utilize this control for our decision today: the record is not adequate; the various recommended returns are not directly transferable, and the industry has not generally accepted the principles involved.

AN APPROPRIATE BASIS FOR DECISION

These limitations inherent in cost-plus producer regulation do not, however, spring only from the allocations and adjustments, nor only from the inherent difficulties of data collection, selection, and compilation, nor only from the resulting deficiencies in the construction of a legitimate costing model, nor only through deemphasis of available reserves estimates. I believe the facts in this case reveal that in the future the Commission need not be confined to cost-plus regulation. The accusation of "drastic inflationary cycles" in wellhead prices in the last twenty years stands rebutted. As a matter of general principle, it is not sound to argue that cost-plus regulation cannot be supplemented because the rise in wellhead prices, experienced in the recent past, was due to producer-dictation of contract prices; that those prices were grossly in excess of cost trends; further, that the wellhead price increase was directly reflected in burner tip increases, albeit four-fold that at the wellhead; and, finally, that any attempt to consider factors in addition to cost-plus regulation would constitute an abdication of

responsibility, and would result only in another round of similar, allegedly violent, price jumps.

The propriety of the price rise since 1945

Any detailed discussion of the accusation of price-dictation by producers will not be undertaken here;[2] however, long

277,719

experience with the industry is convincing that, where price dictation exists, it is seldom with the seller. All available information and discussion lead persuasively to the conclusion that field prices are set after vigorous bargaining within a context of numerous restrictive economic forces. More particularly, in the Permian, there has been an essentially monopsonistic environment whereby the transmission company in a particular field would set, on a unilateral basis, the fixed, maximum rate for natural gas in the area. Accomplishing this unilateral price-dictation is particularly possible for a company free of economic constraint. This was the situation for El Paso Natural Gas Company. El Paso not only purchases over 70 per cent of the interstate Permian gas, but it also produces over 15 per cent of its total volumetric purchases. In this connection it should be noted, as was established by the record in *United Gas Pipe Line Com-*

[2] The problems are well-documented in numerous professional journals and academic surveys. Reference is made particularly to MacAvoy's *Price Formulation in Natural Gas Fields,* (Yale University Press, 1962); Neuner's *The Natural Gas Industry; Monopoly and Competition in Field Markets,* (University of Oklahoma Press, 1960); and Cookenboo's *Competition in the Field Market for Natural Gas,* (The Rice Institute Pamphlet, 1958).

pany, Docket No. RP63-1, 31 FPC, at 55 (1964), wellhead prices are uniformly depressed in areas where pipeline production is prevalent. Nevertheless, many have argued that, if transmission companies had possessed any bargaining leverage, the recent rise in gas prices *could not have occurred*. This argument must be rebutted.

It is clear that the wellhead price increases of the 1950's began at levels not even remotely approximate to the cost or value of separately found reserves. No responsible authority disputes this position. As late as 1960, this Commission is on record that:

> . . . rigid adherence to the rate base method will, in many cases, price the producers' gas completely out of market. This fact is now abundantly clear: Regardless of variations in allocations methods, allowance for incentives, and other disputed factors, computations of the cost of natural gas which have been presented in the many cases before us show that natural gas has been, in most instances, substantially underpriced. 24 FPC, at 547.

When the Supreme Court ordered Commission jurisdiction over natural gas producers, gas was not paying its own way in the industry. The problem came to the forefront in 1948 when the Commission's *Natural Gas Investigation* established that gas was being wasted in enormous volumes, that it nevertheless had excellent value as a fuel, and that the most effective practice would be to establish a minimum price on sales of gas to pipelines in order to conserve the resource. It is paradoxical that, four years prior to its *First Phillips* decision, the Supreme Court should approve state-imposed minimum

wellhead prices for natural gas to the end that it would not be wasted. See *Cities Service Gas Co.* v. *Peerless Oil and Gas Co.*, 340 U.S. 179 (1950). This disparity between costs and past prices

is indicated by our opinion today.[3] If the analysis we utilize for new gas is applied to the average wellhead price for natural gas in 1947, the difference between the two is at least 2.4¢, with the average contract price being *below* the cost-plus figure. In 1947 gas sold at an average price of 6.0¢, but the Commission's present approach, if applied then, would have resulted in a price of 8.4¢. It was not until the late 1950's, according to the costs established today, that natural gas prices came to approximate the cost-plus rationale utilized by our opinion. Thus, the price rise of the 1950's resulted primarily from the gradual maturation of the natural gas industry into one where the product sold was paying a just return to the independent producer. Particularly anomalous, in view of allegations of "continuing inflation" of natural gas prices, is the fact that such an increased allowance to provide a return on investment and expenses is the least that should be accorded the producer as a result of his elevation to a "natural gas company" under the Act.

In addition to natural gas coming into its own, there were, in the main, four factors that led to increases. *First,*

[3] It is not possible to relate our present cost analysis in precise manner to past prices, primarily because of the absence of questionnaire data. Nevertheless, industry-wide statistics provide a meaningful basis for comparison.

the sudden rise in interstate demand necessitated, because of our regulatory standards, an equally sudden increase in reserve capacity with a concomitant market allocation to the higher usage. *Second,* the resultant of such demand was an activation of favored nation and spiral escalation clauses. *Third,* there was an extensive renegotiation of escalation clauses by pipelines in order to preclude such a repetition. *Fourth,* a competitive buyer's market existed temporarily when transmission companies entered new purchasing areas to negotiate contracts at prices somewhat above then extant market values. It is of special significance that wellhead increases occurred in the latter instance, particularly in the Permian Basin in the late 1950's, for it indicates that, without a competitive purchasing structure, producers are not able to achieve the higher prices. Thus, taking the average wellhead prices for the Permian in 1947 and 1956, the prices were 4.0¢ and 9.7¢ respectively, which are prices significantly less than the costs that have been established by this proceeding. By the rationale today utilized, this Commission could have established maximum prices of 7.2¢ and 12.5¢ in those two years, and the difference between the costs and what El Paso was then dictating amounts to prices some 30 per cent *below* the new gas ceiling that would have then been required.

277,721

Furthermore, it must be emphasized that there is absolutely no support, apart from a so-called "anarchic inflation" allegation discussed hereinafter, that trans-

mission companies, even though they possess superior bargaining leverage, are, because of an alleged ability to shift the costs without concern, indifferent to using this leverage. This accusation has been clearly refuted, not only by the published authorities cited earlier, but by the record before us. Witness Mayer, who has participated for over thirty-five years in the negotiation of sales contracts for Phillips Petroleum Company which is the largest independent producer of natural gas in the United States, and has been a supervisor in the sales division since 1945, testified as follows:[4]

> Q: Turning first to matters of general rebuttal, I direct your attention to the question of the Examiner occurring during cross-examination of Mr. Frazier at Tr. 231/27,003, lines 1-4, concerning the degree of bargaining between pipelines and producers existing in the past and present in the Permian Basin and ask you to state what your experience has been in this regard.
>
> A: I have been intimately involved in negotiations with the pipeline companies in the Permian Basin for nearly twenty years. *I have yet to see the time that the negotiator for the pipeline didn't drive as hard a bargain as he possibly could.* In my opinion, the pipelines have negotiated, and will continue to negotiate, for the purchase of gas in every way which will result in the greatest benefit to themselves and their customers.

This experience of the industry cannot, as a matter of record, be disputed. Significantly, the Examiner, although not fully persuaded on this matter for the entire period of the 1950's, was able to conclude as follows:

---

[4] Tr., pp. 28,138-139.

> . . . There is presently intense competition between pipelines for the limited growth in city-gate demand. And now that the city-gate price has advanced materially and distributors' costs have increased, competitive price pressures in the ultimates market have resulted in an added cost consciousness on the part of pipelines.

Since we are here fixing rates for the future, the circumstances with which we should be most concerned are reflected in the above conclusion.

277,722

Reliance need not be placed solely on the above. It is more significant that the rise in the price of natural gas can be fully explained, and that this rise has been part of a long-term picture that cannot be overlooked if there is to be a dispassionate analysis of the price-rise argument. The Bureau of Mines has compiled data in its *Minerals Yearbook* into charts that begin with 1940 or 1945. Such data have been used to emphasize the price rise. This limited survey is misleading because it overlooks the experience of wellhead prices over a twenty-year period prior thereto:[5]

(277,722)

Year	Price (¢ per Mcf)	Year	Price (¢ per Mcf)	Year	Price (¢ per Mcf)
1922	11.1	1935	5.8	1948	6.5
1923	10.0	1936	5.5	1949	6.3
1924	9.3	1937	5.1	1950	6.5
1925	9.4	1938	4.9	1951	7.3
1926	9.5	1939	4.9	1952	7.8
1927	8.8	1940	4.5	1953	9.2
1928	8.9	1941	4.9	1954	10.1
1929	8.2	1942	5.1	1955	10.4
1930	7.6	1943	5.2	1956	10.8
1931	7.0	1944	5.1	1957	11.3
1932	6.4	1945	4.9	1958	11.9
1933	6.2	1946	5.3	1959	12.9
1934	6.0	1947	6.0	1960	14.0

This complete presentation reflects the full scope of the price history of natural gas production: a germinal period of relatively high prices followed by successively declining periods which resulted in depressed prices that were extremely low; the low point was reached during wartime when price controls were imposed based on market conditions; and finally, there was a period of successive increases during the post-war period responsive to the increased demand. Significantly, these statistics establish that the moving average price in 1954, when federal producer regulation was imposed, was 1.0¢ lower than that of 1922, and

277,723

the oft-emphasized increase from 1950 to 1960 was but 0.9¢ greater than the seldom emphasized decrease from 1922-1940.

Even the increase from 1945-1960 must be placed in further perspective. Based on *Minerals Yearbook* statistics, the record exhibits reveal the explosive volumetric growth experienced by natural gas sales over the relevant period: in 1935, 1.92 trillion cubic feet; in 1940, 2.66 trillion cubic feet; in 1945, 3.92 trillion cubic feet; in 1950, 6.28 trillion cubic feet; in 1955, 9.41 trillion cubic feet; and, in 1963, 13.88 trillion cubic feet. During this period demand increased over 700 per cent. This growth, when considered with the circumstances that production rates of return on average total capitalization have declined steadily since 1951,[6] and that several large supply areas have developed from what were once considered doubtful prospects, conclusively establish that there is no substance to the proposition that extravagant producer returns resulted in unnecessary exploratory drilling activity during the relevant period. The activity of natural gas production is simply not susceptible to the same precision of cost-control that is possible in most manufacturing and retail operations. Ultimately, unproductive outlays will always be the price of flowing gas, just as flowing gas will always be the product of once doubtful expenditures.

Reflecting a remarkable demand explosion, the high desirability of natural gas as an energy source doubled its relative position in the energy fuels market. Gas supplied but 14.1 per cent of this market in 1946. This increased to 17.6 per cent in 1949, to 20.5 per cent in 1951, to 24.5 per cent in 1954, to 27.6 per cent in

[6] Respondent's Exhibit No. 220, Schedule 11.

1958, and to 29.4 per cent in 1960. While the 1946-1960 rate of growth for coal-lignite and liquid petroleum was a sluggish 2.4 and 4.7 per cent, respectively, natural gas experienced the rapid growth rate of 8.4 per cent.

The effect of this increasing demand on wellhead prices has been thus explained:[7]

> The sharp increase in field prices over the space of a year or so is undoubtedly responsible for much of the political support of price regulation for the industry. Such a rapid rise in prices is, of course, quite possibly compatible with the operation of a competitive market where consumption increases rapidly and where a part of the increase is in higher value uses, as has been shown to be the case in this industry. Total marketed production

> averaged 5.1 trillion cubic feet per year for the country as a whole in the period 1946-1950, compared with 8.8 trillion from 1953-1955, an increase of about 75 per cent, compared with the 86 and 93 per cent increases in price in [Texas Railroad District Number 4 and South Louisiana]. The relative price increases are not appreciably greater than the relative increase in consumption for the nation as a whole; and in these two areas marketed production was probably up more than the national total.

The increasing demand for interstate gas dictated that annual additions not only equal production, but that a reserve cushion also be added as a safety margin. As annual consumption increased, annual findings had to increase at a greater rate. Prices had to rise, not only to

[7] Cookenboo, *op. cit.*, p. 39.

meet rising costs, but also to finance the annual increase in capacity. In other words, prices had to more than recompense the previous investment in order to provide more than current production. The result was the classic reaction of a free market: prices rose, not only to increase capacity in response to demand, but also to limit that demand until deliverability had accelerated.

The price rise has had, and continues to have, two other highly desirable effects upon the disposition of natural gas: it curbed waste, and it deflected gas away from such inferior uses as carbon black production. The record portrays this quite distinct inverse relationship between price and waste:

Year	Average Wellhead Price Seven Southwestern States (¢ per Mcf) Constant (1947-1949) Purchasing Power	Wasted and Vented Seven Southwestern States Per Cent of Net Production
1946	4.1	24.7
1947	3.9	22.7
1948	4.3	15.7
1949	4.5	15.1
1950	4.7	12.2
1951	4.8	10.2
1952	5.6	10.0
1953	6.7	9.1
1954	7.4	7.7
1955	7.6	7.5
1956	7.7	7.6
1957	8.0	6.8
1958	8.7	5.1
1959	9.4	4.4
1960	10.1	4.2

The Bureau of Mines *Minerals Yearbooks* reveal the identical inverse relationship between price and less desirable uses:

Consumption Sources	1940	1945	1950	1955	1963
Residential	16.7	15.6	19.9	23.4	24.5
Commercial	5.1	5.9	6.4	6.4	8.7
Total	21.8	21.5	26.3	30.3	33.2
Oil Field	26.8	23.5	19.7	16.7	14.2
Carbon Black	13.9	11.0	6.8	2.7	.8
Refineries	4.8	8.7	7.6	6.9	5.4
Electric Utilities	6.9	8.4	10.4	12.7	14.6
Other Industrial	25.8	26.9	29.2	30.7	31.8
Total Industrial	78.2	78.5	73.7	69.6	66.8

In evaluating the advisability of placing primary reliance on field-negotiated prices, it is necessary to appreciate that the increase in wellhead prices was but a slight portion of the increase in burner tip prices, and that neither increase was inconsistent with contemporaneous trends. Witness Jordan's exhibit reflects the following relationship between wellhead and burner tip price increases:[8]

Year	Wellhead Prices	Average Value Residential Use	Wellhead Price as a Percent of Residential Value
1950	6.5	69.0	9.4
1951	7.3	76.0	9.6
1952	7.8	83.1	9.4
1953	9.2	86.5	10.6
1954	10.1	89.3	11.3
1955	10.4	88.7	11.7
1956	10.8	91.3	11.8

[8] Respondent's Exhibit No. 42.

Year	Wellhead Prices	Average Value Residential Use	Wellhead Price as a Percent of Residential Value
1957	11.3	93.0	12.2
1958	11.9	98.2	12.1
1959	12.9	101.1	12.8
1960	14.0	103.4	13.5
Increase			
1950-1955	3.9	19.7	19.8
1955-1960	3.6	14.7	24.5
1950-1960	7.5	34.4	21.8

The above clearly establishes that, while the years 1950-1955 saw a 3.9 cent increase in wellhead prices, they also saw a 19.7 cent increase in residential prices. The years 1955-1960 show a similar relationship: a 3.6 cent increase in wellhead prices and a 14.7 cent increase in residential prices. For the entire period, the relationship was 7.5 cents to 34.4 cents, revealing that residential price increases were the result not of wellhead price increases, but, among other things, of increases in the capital costs and expenses of transportation and distribution. The following nationwide figures are important:[9]

277,726

DISPOSITION OF CONSUMER PRICES

Average Overall Prices	1954	1957	1960
	Prices (per Mcf)		
Wellhead Value	.10	.11	.14
Value at Point of Consumption	.38	.43	.50

[9] Respondent's Exhibit No. 32, Table 14.

	1954	1957	1960	
Functional Shares (per Mcf)				
Production	.10	.11	.14	28%
Other	.38	.32	.36	72%
	.38	.43	.50	100%

CHANGES IN CONSUMER PRICES

	1954 to 1957	1954 to 1960
Functional shares (per Mcf)		
Production	+0.01	+0.04
Other	+0.04	+0.08
Total	+0.05	+0.12

These charts are persuasive indicators that producers have not been the cause of "anarchic inflation". To the contrary, the legitimate costs of producing and delivering natural gas have necessarily resulted in price increases which must be borne to the end that a sufficient and assured quantity of gas is available for ultimate users throughout the Nation. Significantly, our opinion today establishes that costs have risen to rates that are no more than is required to provide natural gas service.

The price indices at production and consumption points for various fuels, and a comparison of production point fuel price increases to general indices is conclusive in the cumulative statistical presentation. The record reveals the following:[10]

277,728

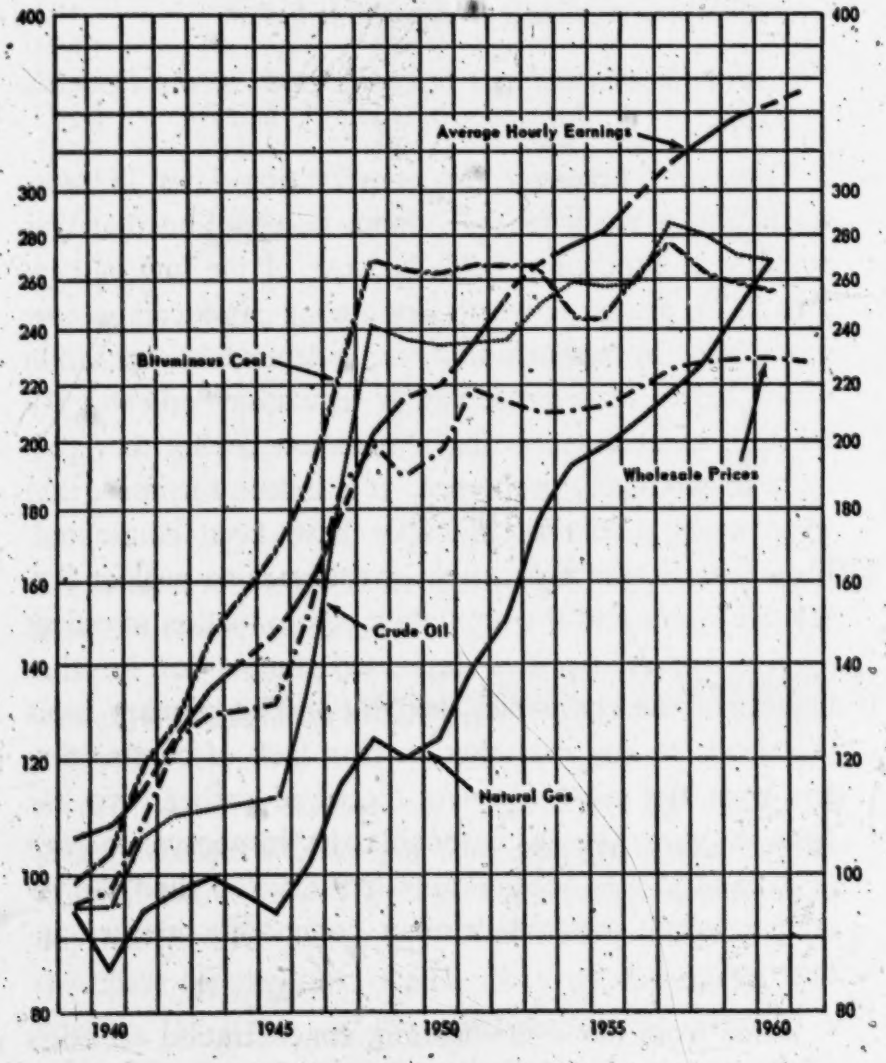
These data reflect what has been too-lightly disregarded: that the rise in natural gas prices was not excessive in relation to the rise in interstate demand, the rise in wholesale price trends, the rise in price trends for competitive fuels, or the rise in average hourly earnings. They also reveal that criticism cast on the producer for residential price increases was 80 per cent misplaced, and accusations of extraordinary production returns were statistically unsupported. This overall picture is made clear by the chart on page 24. Rather than constituting a justification for rigid cost-plus regulation, the criticism is refuted by the extensive investigation and cross-examina-

tion that has occurred in this case. It must be concluded that natural gas has been earning no more than a fair return on its costs, and the absence of conclusive evidence to the contrary bolsters the presumption that the competitive factor in the field provides, within limitations, the necessary independent determinant to this Commission's regulatory responsibilities.

The absence of producer price-dictation in the Permian Basin

The early necessity for conservation laws in most states was a result of the ruinous competition that was possible in producing fields because of the law of capture. This era of active rivalry among producers is now past, but the opportunity for independent operation which led to state conservation regulation indicates the sense of independence that is common among the operators of producing properties. It is indeed fortunate that these early predatory practices have been eliminated. Furthermore, the prevention of drainage to protect correlative rights and the regulation of production to reflect market demand has not eliminated competition in other aspects of the companies' activities. The primary basis that leads to any presumption of a lack of competition has been the price rise. As discussed earlier, this has been no more than a reasonable rise responsive to high costs, and it was considerably less marked than the increases which resulted in other commodity-oriented industries.

Aside from the overwhelming concentration on costs by Staff and the California distributors, thorough con-



277,729

INDEX NUMBERS 1935-1939 = 100

732d

sideration of the competition issue has been clouded in a failure to make precise definitions. The problems of description and categorization result from the various meanings attached to the concept of competition. In my view competition means a buyer is free to purchase alternative sources of a product from relatively small sellers acting independently of each other.

However, in addition to the price rise emphasis, certain parties improperly assume monopolistic motivations. This assumption necessarily rests on the classical model of only two sellers of equal power; it thereby overlooks the environment in which enterprise operates: that of sellers of different size subject to a multitude of economic conditions, all of which combine to make any final price the subject of numerous considerations which regulators can at best estimate. More evidence is needed than a restricted competitive model. Consideration must be given to relative size, to numbers of companies, to ability to enter the market, to any business arrangements between various sellers and buyers, and to the countless other factors that make up a market. Of particular

significance to the producing industry are such special market conditions as acreage controls, flaring rules, and the prevention of lapse of the lease. The question is one of the power of a seller or group of sellers to dictate a price that is divorced from costs. This condition does not exist in the Permian Basin. It is clear that there is such a measure of effective competition that in future proceedings producers can be accorded a relative degree of independence to the end that contract prices determine the ceiling price we set for natural gas.

On the record before us, there is no evidence of monopolistic power possessed by producers in the Permian Basin. The issue, though properly raised by the producers, has gone unnoticed by the other parties. Respondents have met the burden of proof on the competition issue. Staff and the California intervenors have not. The state of the record is such that Respondents have made every possible showing of competition, and, further, they have shown that this competition is sufficient, under a majority of the contracts, to provide a meaningful methodology for determination of just and reasonable rates. It is no answer to say that the producing industry has not met its burden. The burden of proof is not solely on Respondents. Although this proceeding involves Section 4(e), filings, where the burden is expressly placed on producers, it is essentially a Section 5(a) proceeding in which our Staff must make the proper showing. Nevertheless, this case cannot turn on the burden of proof. There is sufficient evidence on all issues.

Furthermore, that this is a regulatory proceeding does not detract from thorough consideration of relevant economic evidence to ascertain whether producers exercise undue powers over price. Certainly there is no basis for a presumption that there is no competition. The ramifications of the order we issue today require comprehensive and meaningful treatment of this issue.

Briefly, the record shows that, of all producers in the Permian, 361 were named in the order initiating this proceeding, but no one of these sells over eight per cent of the gas produced on a national basis. In addition, at least 2,280 producers in the Permian Basin supply gas to processing plants under percentage contracts. In the aggregate, there were 54 producers in 1960 who sold over ten million Mcf of gas per year. In the Permian Basin there are 20 producers selling some 80% of the gas produced. These numbers and sizes necessarily raise the presumption that there is such a degree of self-interested rivalry and of independent action as to preclude a presumption of concerted action. On the other hand, there is not a scintilla of evidence that any of the producers have ever acted collusively; they have not exercised their power in a manner harmful to the competitive market. There has been no parallelism in prices to indicate action by any producers to

control price. This stands out clearly:[11]

Year	Company	Number of Contracts	Price Range
1953	El Paso Natural Gas	45	9.0¢-10.0¢
1954	El Paso Natural Gas	80	8.5¢-10.0¢
	Permian Basin Pipeline (Northern Natural Gas)	6	9.0¢-10.5¢
1955	El Paso Natural Gas	32	8.5¢-10.0¢
	Northern Natural Gas	2	9.5¢-15.0¢
1956	El Paso Natural Gas	47	7.5¢-10.0¢
	Pioneer Gathering System	1	11.0¢
1957	El Paso Natural Gas	36	9.5¢-11.0¢
	Northern Natural Gas	7	9.5¢-16.0¢
	West Texas Gathering Co.	15	16.0¢

[11] Respondent's Exhibit No. 25, Schedules 12 and 13.

Such a vast range in prices over the period of almost a decade certainly is suggestive of the fact that all producers, or even the major sellers do not exercise effective monopoly powers.

277,732

There is relative ease of entry into the business. Such discrimination as may exist comes, not from producers, but pipelines. Further, it must be emphasized that such factors as a rapid growth rate, excess capacity, and meeting the prices of a rival are conditions to be expected in a market that is rapidly expanding and coming into its own. The opening of markets and the high rate of technical progress usually characteristic of such a situation make for uncertainty as to the most profitable policies. Any uncertainty of prices under contracts, even when Transwestern broke El Paso's monopoly, reflects no more than unprecedented demand and not monopoly control by producers.

The sole non-competitive factor has been the long-term contract, required by this Commission as a condition precedent to certification. Early uncertainty as to the proper prices for natural gas and particularly its use as a waste product acerbated this twenty-year pricing policy by compelling producers to insist on various indefinite escalation clauses to the end that, once stable prices were realized at a level that returned costs to the producer, each seller would so benefit. These clauses have been negotiated in the Permian since at least 1945 when El Paso contracted with Phillips for a sale of gas

at 3.5¢ per Mcf, but subject to indefinite escalation based upon El Paso's resale rates at the California border. Since the middle of the last decade, such indefinite escalations have been uniformly condemned. The following comment is relevant:[12]

> Many witnesses appearing before the committee, particularly those representing distributing interests and consumer areas, maintained that escalation clauses in existing contracts, unless their operation is controlled in some effective manner, could result in very large increases in the cost of gas to consumers —
>
> 277,733
>
> particularly in view of the fact that a contract for natural gas usually runs for 20 years or more, and a large proportion of the contracts presently in effect were entered into in recent years . . .
>
> It is provided . . . that where a rate increase is based on a price increase resulting from the operation of an escalation clause [except the so-called step-up and tax-increase clauses] in an existing contract the Commission may not consider as an operating expense for the purchase of such natural gas any part of the increase in price which results in a price in excess of the reasonable market price therefore.

We have endorsed the above recommendation by prohibiting the prospective operation of such clauses.[13] Our

[12] Report of the Committee on Interstate and Foreign Commerce; to amend the Natural Gas Act, as amended; House Report 992, p. 9 (84th Congress, 1st Session, 1955).

[13] See the *Pure Oil Company*, 25 FPC 383 (1961); Order Nos. 232 and 232-A, 25 FPC 379, 609 (1961), amending Sections 154.91(a) and 154.93 of the Commission's Regulations under the Natural Gas Act.

opinion today permits their further operation only to the extent they were negotiated in past periods and in any event such escalations cannot exceed the ceiling rates. Looking to the future the extensive impact of limited price increases in new contracts cannot approach the increases realized in the last decade. Thus, by this determination, there is a solution to the single factor that has compromised workable competition.

Finally, in determining the competition issue, it is relevant to consider an energy market broader than the natural gas industry of the Permian Basin. It is clear that natural gas is presently sold at a level competitive with other fuels and sources of energy. This is particularly the case on a national basis, and is the result of continuing economies in the coal and electric industries. If our analysis is expanded beyond the Permian to take cognizance of this national energy market, there is evidence of those conditions that would indicate restrictive economic forces. There are alternative energy sources to provide an independent

determinative of prices. The consumer's individual outlay does not restrict his freedom to select alternative sources; the energy market is in a state of equilibrium. For this reason, if no other, transmission companies cannot disregard the prices paid to producers, and, particularly for the future, it cannot be assumed that the pipelines do not have the same interest in their investment as the distributors have in their related investment.

Reliance on the price rise to justify a conclusion of producer price-dictation must falter in the face of overwhelming evidence that this rise was parallel to the rise in all other price indices, that the price rise reflected the elevation in the value of natural gas to a level that would return to the producer his reasonable costs, and that there is competition sufficient for our regulatory purposes. For these reasons, I rely upon the reasonable market prices in addition to the cost considerations in our decision.

JUST AND REASONABLE RATES BASED ON CONTRACTS

Far from undercutting our power to impose effective price ceilings, a price-demand approach would retain flexibility and would still present a direct relationship between cost considerations and the price ceiling. In view of the cost presentation herein, it appears that in the future reliance on competitive forces should be sufficient. The independent operation of substantial parts of the market will provide an average price accommodating to the mandate that controls be imposed upon prices for natural gas. To the extent possible, one part of an essentially joint product will be regulated in a manner responsive to the needs of both the industry and the consumer. So long as most producers can operate under a compulsory price ceiling, the supplies will be available, and by that ceiling the consumer will be protected from price escalations that are not acceptable. The question becomes one of methodology. Although it might be preferable to enact legislation to abandon any effort at

price control other than such reasonable restraints as might be imposed upon pipelines, such limited controls are not totally removed from a method that has proven successful in the last few years.

Relevance of our in-line pricing policies

Following the Supreme Court's mandate in *Atlantic Refining Company* v. *F.P.C.* (*CATCO*), 360 U.S. 378 (1959), the Commission has followed a course in Section 7 proceedings of fixing ceilings at reasonable rates relevant to the existing market. It has thereby centered its attention on the weighted average prices under contracts which provide for the sale of substantial volumes of natural gas in interstate commerce. Indefinite escalation provisions have been removed, and rate increase moratoria have been imposed. Attention has been directed to permanent and temporary certificates covering contract rates, and the Commission has strenuously resisted all attempts to interject cost presentations submitted on an individual company basis. It has thus been successful

in effectuating, simply, quickly, and with minimal disruption, what five years of agitation and uncertainty, fraught with numerous procedural disruptions, can scarcely improve upon: fixed rates that are sufficiently high to induce adequate reserve accretions and yet with provisions for rate increases that would be so gradual that any unpredictable economic disruption at the distribution end of the natural gas industry would be precluded. Al-

though the procedure was notably unrefined, it has likewise proven to be remarkably efficacious. The in-line procedure took the notable step of avoiding cost-plus producer regulation and thereby illustrated that a "sane, sensical, and effective" course to producer regulation was available. Significantly, it represented initial development of the policies we adopt today. Nevertheless, since in-line proceedings arise under Section 7, it is appropriate that there be a more thorough analysis of contract prices when consideration is given the standards of Sections 5(a) and 4(e). Thus, the Ninth Circuit has stated that the provisions of Section 7 for certificates of public convenience and necessity do "not mean that before certificating such a sale the Commission must determine that the proposed initial price is just and reasonable [by Section 5(a) and 4(e)]." *United Gas Improvement Co.* v. *F.P.C.*, 283 F.2d 817, 822 (9th Cir. 1961).

The record in this case provides substantial evidence that in the future we should perfect a system of producer regulation that considers costs, but relies on the competitive forces, which in themselves provide an independent determinant to prices apart from what producers might prefer to dictate. Thus, the logical focus of producer regulation on an area basis lies in the negotiated field contracts. They are executed under circumstances of market compulsion after full consideration by persons intimately associated with the industry of all the factors that a regulatory agency can only estimate. These contract prices provide a privately-litigated answer to the question of what rates will be necessary to get the gas out of the ground. Any meaningfull system of regula-

tion would appraise the level of these prices as determined by arm's length bargaining in a competitive market. The analysis should include intrastate prices for that market will provide useful information for comparative purposes. While it is to be expected that regulation will distort a competitive market, contracts continue to be negotiated above these ceilings, and in-line price conditions are refused by producers in favor of other markets. Finally, since costs now approximate revenues, it should follow that competitive prices would accordingly be in-line.

277,736

The focus on contracts would remain constant unless there were important departures in direct relation to current experiences and projections of production volumes, exploration and development expenditures, drilling success ratios, market demand reserve additions, and the general cost indicia of the national economy. Of these several economic indicia, the single most important one is the reserves added each year. This is the crucial measure of the ability of just and reasonable rates to elicit the necessary supply. For present purposes it is apparent that field negotiations have been successful in eliciting supply, and that no specific reserves to production ratio should be required. The other important economic indicia are exploration and development expenditures and drilling success ratios. Both are joint costs of the oil and gas industry, but substantial deviations of either over the long term will require corresponding rate adjustments. Necessarily, both relate to the supply

CARD 13

elicited. It is these relationships that can best assist us in a determination of whether regulatory controls are successful in meeting current and projected needs. If adequate reserves were being elicited, an uncomplicated, practical decision would be one which imposed a single ceiling approximating the initial price mode or median of new contracts. If additions were excessive, based on current ratios, the ceiling could be lowered to inhibit exploration and dedication of further volumes to interstate commerce. If additions were deficient, the single ceiling would be adjusted proportionately upward, and, if the reserve posture required even more drastic remedies, contract rates could be increased upward pursuant to Section 5(a) as construed in *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1956). Finally, if specific rates were unduly discriminatory or preferential in specific cases they could be adjusted within the purport of just and reasonable rates.

Such a policy could be implemented with a maximum of time and expense. The regulatory burden would be greatly relieved, and Federal expenses would concomitantly be reduced. Although an orderly conclusion of pending area rate cases is presently required, contracts should provide an expeditious basis for setting just and reasonable rates in all other producing areas. Ancillary benefits would follow as cost-plus thinking is de-emphasized. More meaningful reserve data would be obtained. Difficult allocations could be of more limited impact. Cost questionnaires, indicative of whether trends in wellhead prices were approximating general indices,

would be far more simple and consequently far less expensive to complete. Since prices would be established expeditiously, they would be maintained current without resort to figures and testimony that are five years old. This would be achieved in addition to our current policy, clearly the most consumer-conscious yet effected, of imposing increased limitations to maintain current prices with provisions for filing for moderate increases in accordance with market determinations and other general economic trends.

277,737

The Reasonable Market Prices:

Subject to these additional views on the course we should take in establishing just and reasonable area rates for the Permian Basin, I concur fully in the Commission's opinion. Our opinion establishes that profit-oriented costs and supply oriented contracts do not, in the aggregate, depart in any significant manner from each other. To the contrary, an analysis of market prices establishes that contracts have apparently approached costs for the natural gas industry in the Permian, and, for the past few years, have maintained a level close to the cost analysis we here adopt. This is a significant stabilization. Thereby, a market price has been established which provides a reasonable measure of the rate necessary to elicit supply. From the record in this proceeding, for the period with which we are concerned, the overwhelming volumes of gas-well gas are sold under new contracts at the weighted average price of approximately 16.5¢. Con-

sidering this close proximity of the contract average to composite costs, it is clear that, by either standard, the rates we prescribe for the Permian Basin are just and reasonable.

The record establishes that, for all filed contracts in a seven-year period before and after 1960, there was a range in prices from 2.15 to 18.0¢.[14] The weighted average price for these contracts, based on volume, was 14.20¢ for 1962. This price is based on the initial contract price, and it is not shown what adjustments, if any, were provided for quality, taxes, and other circumstances. These have a definite impact on the regulatory rate we must establish. More particularly, as of early 1962, approximately one-half of the volumes sold was at an upward range from 15.0¢ to 17.0¢. Under various periodic escalations this price could be increased, by the end of 1968, to a price ranging from 16.0¢ to 18.0¢, with the overwhelming volumes being sold at prices approaching 18.0¢. Since we here intend price control up to an earlier date, Respondent's contract testimony is commensurate with the just and reasonable rate for the period. Other testimony establishes that, for contracts dated subsequent to 1960 but prior to the middle of 1963, the base prices range from 9.0¢ to 17.0¢ for gas-well gas, with the larger volumes flowing at rates ranging from 15.5¢ to 17.0¢ with the largest volumes at 16.0¢.[15] Based upon this survey of base prices under contracts, some as reduced under certificate conditions and accepted

[14] Respondent's Exhibit No. 252.

[15] Staff's Exhibit No. 317A.

by producers, the 16.5¢ rate established by our cost analysis is clearly within the range of contract prices.

There are limitations in relying solely on the above evidence, primarily because various adjustments for deviations from the standards for pipeline gas are not necessarily reflected in the contract price for new gas-well gas. The weighted average contract price for gas-well gas is 14.76¢, apparently after certain proportionate adjustments to reflect deficiencies.[16] Among others, these deficiencies include excessive sulphur and hydrogen sulfide content, excessive water content, below

standard pressure, and excessive carbon dioxide in the gas. From the record it appears that the possible range for specific adjustments will be from three to five cents; however, for all adjustments that might be necessary, the reasonable amount of the average adjustment will be in a range of from 1.0¢ to 1.7¢.[17] Adding this adjustment to the average weighted price of 14.76¢ a ceiling is indicated of from 16.0¢ to just below 16.5¢. In accordance with a policy of rounding upward, this would mean that a price of 16.5¢ is the just and reasonable rate for new gas well gas.

---

[16] Staff's Exhibit No. 334.

[17] A precise adjustment for quality cannot be ascertained from the contract exhibits in this proceeding. The Examiner made a general determination that one cent would be appropriate. See Examiner's Decision, pp. 69-73. Subject to developments under the quality adjustment procedures, we establish, the range is presently appropriate.

Further analysis of the record evidence supports the above conclusion.[18] Since the contract prices must be considered in the light of the quality of gas sold, it appears clear that, of the limited volumes of gas sold at pipeline quality standards, the 16.5¢ rate is clearly in line. The highest price for new gas-well gas is 17.0¢, which was paid for an estimated annual volume of 2,126,400 Mcf under six rate schedules. All of this gas appears to meet pipeline quality standards, except for 180,000 Mcf of gas sold under one contract allowing a lower Btu content and containing no specification as to water content. A larger quantity of new gas-well gas was sold at 16.0¢ — 6,149,336 Mcf to El Paso, 9,751,680 Mcf to Transwestern, 2,444,772 Mcf to Northern, and 958,320 Mcf to West Texas Gathering Company. All contracts for sales to West Texas Gathering Company would allow delivery of "sour" gas. The 16.0¢ price might have been higher had the gas been required to be of pipeline quality. These contracts are silent with respect to water content. Contracts governing the 2,444,772 Mcf sold to Northern provided for a minimum Btu content ranging between 950 and 1,000 and had no provision with respect to water content. These contract provisions do not reveal the actual quality of gas delivered, but again it appears that the 16.0¢ price would probably have been higher for higher quality gas. It is indicated that a 16.0¢ price paid by Transwestern was negotiated despite variations in the quality of the gas. Some 420,000 Mcf sold under three contracts is subject

[18] Staff's Exhibit No. 334.

to contract provisions requiring that the gas meet all pipeline quality standards save that the contract is silent with respect to water. The actual water content of the gas delivered cannot be determined. The remainder of the gas appears to be below standard in either pressure or in hydrogen sulphide content. Some 1,108,000 Mcf of this gas may also be deficient in Btu content, and about 6,475,000 Mcf of this gas moves under contracts which provide no standard with respect to water. The El Paso contracts at 16.0¢ are uniform in fixing delivery pressure at 1,000 pounds but are silent on most of the other quality standards.

277,739

At the contract price of 15.0¢, estimated annual volumes of 8,433,048 Mcf of new gas-well gas were sold to El Paso and 2,007,324 Mcf to Northern. The 26 El Paso contracts at this level are, with two exceptions, silent as to water content. Eleven of them require pipeline standards with respect to sulphur and hydrogen sulphide. One is silent on this subject, and the remaining 14, totaling nearly 3.5 million Mcf, do not require pipeline standards with respect to sulphur. Pressure appears to be below pipeline standards in the case of the majority of the 15.0¢ gas sold to El Paso, and possible Btu content deficiencies are indicated with respect to about one-third of this gas. The three contracts at 15.0¢ for sale of new gas-well gas to Northern provide for pipeline quality standards in all respects save that no standard was provided with respect to water content. Again we have no

information as to the actual water content of the gas delivered. From the above it must be concluded that new gas-well gas delivered at prices below 15.0¢ is, from the record before us, deficient with respect to one or more quality standards.

Attention should be called to the fact that the prices set forth in this exhibit are not for all the market sales of gas in the Permian Basin Area. No information was included in this record as to particular non-jurisdictional sales although some attempt was made by the Staff to show that the average non-jurisdictional prices were lower than jurisdictional prices. I emphasize that such intrastate conditions of the market are relevant considerations to area pricing. Taking all these factors into consideration upon the evidence presented, it must be concluded that our price of 16.5¢ set for new gas-well gas is appropriate; therefore, a just and reasonable rate is established.

Despite the validity of the 15.5¢ base price (exclusive of State taxes) for new gas-well gas, it is not acceptable to the extent that there is not a full upward adjustment for high Btu content.

It is clear that the quality of a particular volume of natural gas has a definite impact on the value we should assign to that gas. Consumers are interested, not in Mcf's, but in the heating units derived therefrom. For variations from what is required to supply consumers adequate therms of gas, there should be proportionate adjustments. On the basis of the record before us it is a matter that is not readily susceptible to resolution, and,

to determine the full extent of the adjustments that might be necessary, we have ordered procedures for negotiation of these matters.

It appears that natural gas from the Permian Basin is generally deficient in many of the standards required for pipeline quality as we have proposed in R-200, noticed at 18 FR 2.60, 2.61 (1961). A large amount of sour gas is found, there are several fields with large amounts of carbon dioxide, and low pressures are common. These deficiencies are to be reflected in downward adjustments from our base prices. On the other hand,

Permian gas does have one quality — Btu content — that is apparently higher than is delivered to pipelines in other producing areas. I dissent from the anomalous position of requiring full downward adjustments for all quality deficiencies while denying to producers a right to obtain meaningful upward adjustment for the single quality standard that is above pipeline quality. I emphasize that this dual standard attacks the validity of our cost analysis since, absent proper upward adjustments, it is possible that producers will not recover their legitimate costs.

In our recent decision in *Texaco Inc.*, Opinion No. 464 (issued June 10, 1965), we determined that, for the Hugoton-Anadarko producing areas, 1000 Btu's was the standard for pipeline quality there. Significantly, we relied on the contract terms, although Staff had favored

a weighted average base of approximately 1020 Btu's. It is appropriate to adopt area standards, but this being an area proceeding, all relevant circumstances should be considered. It is far from clear that the area standard for new gas-well gas is at 1050 Btu's. The weighted average for new gas-well gas is 1042, but this average is derived by excluding carbon dioxide volumes; if the latter are included the weighted average is lowered to 1034 or lower. Furthermore, it should be noted that the weighted average for all gas flowing in 1960 appears to be at 1039 Btu's. If our attention is directed to the contract requirements of the pipelines, which is the standard for determining all the quality deficiencies, it is clear that the minimum required is 1000 Btu's or lower. The standard Btu provision imposed by the transmission companies for purposes of price adjustments or rejection is between 1000 and 950 Btu's, but the preponderance of the contracts requires 1000. The opinion is thereby left with an obvious gap of 50 Btu's by which producers are denied the benefits of the gas they sell. If we compare the area standard with the national standard, it is clearly at 1000 Btu's, as we have proposed in R-200. Finally, it appears that the 50 Btu gap is important solely to the California distributors as a result of the high Btu content in the gas delivered to them at the California border. The reasons for this high standard are not known; certainly no producer participated in the negotiations leading to these sales. Rather than approve a practice of unknown origin, I would rely on the uniform contract standard for the Permian area, for the Nation, and for our proposed R-200

to set an upward adjustment from 1000 Btu's for new gas-well gas.

There are major difficulties in basing regulation on contracts while adopting the directionality thesis. Under price-demand split-level pricing should be avoided. In addition, since the natural gas industry generates a large portion of its own capital, it thereby underwrites current exploration by the older production. Reinvestment is an accepted and necessary feature of the industry, and the revenues it receives must be a source of funds for continued and increased nationwide exploration and development. We can be assured that the needed gas will not be found unless we acknowledge a proper role to reinvestment. This conclusion is particularly compelling during a transition to effective just and reasonable rates. We must condition our determination today to developments under a two-price system. Directionality is presently acceptable as an exploratory device of the industry. Because of the variance in elasticity between casinghead gas and gas-well gas, price can be utilized as a device to elicit supply; however, such regulation must be premised on a two-price system to reflect

market conditions. In these circumstances, the selection of a dividing line between old and new production can be made. In view of the necessary role of reinvestment and of the long pendency of these proceedings, the division date should be drawn between the years when reinvestment was the sole reliance and when directionality had

begun to establish itself. Since this had occurred by 1960, I accordingly join in the division date for old and new gas. For the test year, the weighted average price for all flowing gas-well gas was below 14.5¢. Again, the record is deficient as to the quality of this gas. The record does establish that the weighted average revenues received for all gas-well gas flowing in 1960 was 13.05¢.[19] Applying an appropriate upward adjustment for quality deficiencies a price in the range of 14.0¢ to 14.5¢ is established. It is noted that this is a different standard for determining a price for old gas-well gas than for new. Nevertheless, it is an appropriate standard for determining a regulatory rate reflecting the price at which a majority of producers are able and willing to sell gas for a period encompassing several years during which costs were apparently being recovered. This is offset by the less demanding standard required for new gas-well gas to the end that an appropriate incentive is utilized. Further, the 14.5¢ ceiling applies to new casinghead gas and to residue gas from non-gas-well gas reservoirs. This reflects the relative inelasticity of those types of gas. Therefore, it can be concluded on the present record that the cost-plus rate of 14.5¢ for flowing gas is the just and reasonable rate, and I accordingly support the rate design prescribed. For future proceedings our opinion should lend support to this simpler and more realistic approach.

---

[19] Staff Exhibit No. 175, Schedule No. 1. It should be noted that the average initial price for gas-well gas sold in 1960 is 13.2¢. See Staff Exhibit No. 118.

It follows from my dissent as to the appropriate Btu standard that I also dissent from the determination to permit an upward Btu adjustment only for new gas-well gas. The fact that tremendous volumes of high Btu content gas are sold in residue gas, in casinghead gas, and in old gas-well gas is not considered, although our quality standards otherwise apply to all types of gas. I cannot condone this discriminatory determination. Upward Btu adjustment from a base of 1000 should be applied to all gas from the Permian Basin. I would note that the additional revenues to the producers as a result of the 1050 standard will apparently be so minimal as to be meaningless. The better course would be to avoid any standard pending developments under the quality adjustment procedures.

Although I believe a more complete discussion of just and reasonable market prices should have been added to supplement the reliance solely on cost-plus, I support the rationale in the main opinion. The cost analysis there employed is not only reasonable; more important, it is a feasible synthesis of the cost evidence before us. Such costs are most useful as a basis for comparison to the contract prices. Our proceeding has established a significant point: there is no substantial difference between market and costs in the Permian. Either method is presently permissible

277,742

for purposes of area ratemaking. Accordingly, with the single exception of the Btu standard, I join in the procedures recommended for applying and enforcing the prices determined here today.

Area Rate Proceeding Claude E. Aikman, *et al.* North Central Oil Corporation (Operator), *et al.*	*Docket Nos.* AR61-1 G-18466, *et al.* CI60-435, *et al.*

(Issued August 5, 1965)

ROSS, Commissioner, *concurring and dissenting on limited issue:*

The instant decision represents, in my opinion, a noteworthy advance toward the goal of effective producer regulation and one which, with but one exception, I fully support. In addition to the Examiner and the parties, we are indeed indebted to our Staff and our predecessors on the Commission for their ingenuity in suggesting the concept of the area approach and for beginning this case.

The decision properly recognizes that the basic purpose of the Commission's rate regulation is to assure for the consumers of this nation an adequate supply of gas at reasonable prices. In the course of developing a methodology to meet this objective the majority significantly expresses a flexible and receptive attitude towards

certain issues that were not adequately developed by the parties in this first attempt at area producer regulation, notably capitalization of E & D costs and the usefulness of econometric presentations. My principal purpose in writing this separate statement is to emphasize and focus attention on the changes forecast by the majority, and to suggest future potential refinements in both the methodology and basic data.

While the decision is essentially sound, there can be little dispute that the margin of error will be narrowed as more complete and meaningful data are made available. Surely regulators should not be expected to vouch for absolute accuracy of their predictions without comprehensive and comprehensible gas reserve information.

Since the advent of electronic computers, econometrics has become increasingly useful in many fields as a tool for analyzing complicated economic problems. For the first time in a proceeding before this Commission, an attempt was made to analyze and test the complex interaction of regulatory and market factors with the aid of such advanced statistical and mathematical techniques. The Staff's econometric studies, commonly referred to as the Weln model, were a commendable effort to clarify the supply-eliciting function of natural gas field prices. This is one of the strongly contested and critical issues in this proceeding. The producers, drawing mainly on an analogy with unregulated competitive markets, argued that higher gas prices will elicit larger supplies. The Staff, on the other hand, stressed the inherent limitation on the industry's ability to respond to change in gas prices.

According to the Staff's presentation, the economic determinants of future gas supply include not only the price of gas, which is being fixed in this proceeding, but also various other factors such as the determinants of market demand, the price of oil, and the success ratio in exploratory drilling.

One valuable feature of the Staff's studies is the attempt to identify and quantify both the direct incentive effect of price on exploratory activity and the indirect "feedback" effects on supply due to the price elasticity of gas demand under conditions of interfuel competition in the market place. These opposing effects, as well as the independent effect of oil prices on exploratory activity, cannot be assessed profitably in the abstract, i.e., by gut reaction, but should be quantified, if at all possible, in the interest of more informed regulation under the Natural Gas Act. An example of this questioning attitude is Staff's refusal to accept automatically the proposition that the supply-eliciting function of price in unregulated competitive markets, where price is the result of the push and pull of impersonal market forces, is duplicated in the gas producing industry.

In the long run, I am confident that such analyses will provide fresh insights into the behavior of natural gas supply. I am also confident that this modern economic tool, as it becomes better known, will be adopted by the industry for its own use. Inevitably, this will result in a better understanding of the industry both for the manager, the regulator and the consumer.

In view of the fact that directionality with a two price system has been accepted by the Commission, it is inappropriate for this reason alone to use the results of Staff's studies. Their usefulness in the context of this case has been to cause everyone to wonder about and question the heretofore unchallenged hypotheses of the petroleum industry. When better developed, I am sure the results will provide both a practical and *legal* foundation for better gas producer regulation. I am therefore looking forward to the continuing use and refinement of the application of econometric and other advanced analytical techniques to the difficult task of producer regulation in future proceedings. Surely we should strive for more objective evaluation of economic matters in contrast to relying on our "feel" in such situations.

In view of the basic approach adopted in the decision, the desirability of establishing future area rates in the context of a nation-wide proceeding — from both an economic and administrative standpoint — is strikingly confirmed. The price for new gas is based entirely on a nation-wide rationale and on nation-wide data. This same

basis is used to support the price determined for all other gas. As the decision concludes, the search for gas is conducted on a national basis. This is true not only with respect to producers but increasingly regarding the pipelines as well. The evaluation of location on price, the importance of which the decision affirms, can be determined much more effectively — if not exclusively — in

a proceeding which considers the interrelationships of the various areas of supply with the markets they serve.

From a purely administrative point of view, a nationwide proceeding is a practical necessity. This marks only the first area case, which covers three producing areas. At this time final decisions in the three pending area cases involving eight producing areas are far from imminent; yet a further consideration of Permian rates will be due in a relatively brief two and one-half years. At this rate of progress, a review of Southern Louisiana rates could be due even before the Hugoton-Anadarko cases are concluded. It is easy to see that the Commission could well become involved in the determination and redetermination of the rates for but a fraction of the producing areas in the country, and never complete the job of determining the rates for all of the producing areas. Either this will be the result, or the Commission as well as the industry and other interested parties will be required to add tremendously to their staffs.

Considering area rates within the framework of a national proceeding would also obviate the necessity of plowing the same old ground time and time and time again. Area proceedings involve substantial time and cost not only for the parties but also for the Commission and its staff. While separate area proceedings have advantages for the first couple of cases, the law of diminishing returns rapidly takes over.

Another aspect of our decision which is ripe for further consideration concerns a method of pricing new gas, com-

monly referred to as project accounting. This method visualizes a project consisting of the finding of a given volume of non-associated gas reserves by the drilling effort in a specific test year (e.g., 1960) and the subsequent production of that gas over an assumed depletion period. All necessary outlays to acquire the capital assets (i.e., the reserves), together with an appropriate return on the investment over its productive life, are assumed to be recovered through the revenues traceable to the initial investment. Cash production expenses related to the lifting of the gas to the wellhead are also estimated and added to the investment charges to arrive at a total cost per Mcf to be recouped on a unit-of-production basis over the depletion period. This cost model, which capitalizes all investment outlays relating to the acquisition of the asset and then

277,746

allows a return thereon during its period of commitment, requires what is sometimes called a "true yield". The acceptable method of determining such a rate is an investor-demand type of study focusing on the "capital attraction" rate or the experienced cost of borrowing in the capital market. This is the rate of return standard that is commonly applied by the Commission in regulating natural gas pipelines and electric utilities.

This method can be compared with that employed by the Examiner and adopted by the Commission which is probably best characterized as a form of cross-section accounting. Under the latter method, the costs are esti-

mated for the volumes produced in a given year, assuming equal production from a universe of gas producing properties equally distributed by vintages (thus cross-cutting all vintage projects). Further, under a convention of accounting in the petroleum producing industry, but without logic in economic costing, the cost model of the distributors capitalizes only the costs directly associated with productive properties, which is only a portion of the total cash outlays made in acquisition of the reserves. Outlays for dry holes and other expenditures not directly associated with successful properties are presumed to be expensed in the year of outlay, rather than to be recovered in future years from the revenues of producing properties discovered in the course of a general exploratory effort. Thus, E & D expenses, not related to the production or output of the given year, are substituted for those E & D outlays of previous years which were incurred in connection with the successful exploratory efforts and recouped in the given year when the reserves are being produced. Cash production expense, depreciation, depletion, and amortization expenses, and a return on investment computed on a cross-section basis are also charged on a unit-of-production basis.

In selecting a cost model for new-gas well gas, consideration must be given to the fundamental character of the economic costing problem. Unit costs of production for any commodity or service can only be arrived at by a careful matching of all necessary inputs with the associated output. This matching must, because of the time value of money, adequately reflect the timing as well

as the cost of all inputs. Inputs allowed must strictly relate causally to the output and all such inputs, with their timing, must be fully represented. The project method of accounting meets this basic requirement. In contrast, the other method expenses the portion of the capital outlays which relates to unproductive properties as if they were current operating costs, even though that portion is inseparable, at the initial planning stage, from the successful E & D outlays. Such expensing practices can lead to a distortion of the investors' allowed return from revenues generated by the initial investment.

277,747

In addition, an ancillary benefit of the project method lies in the fact that the somewhat discomforting aspect of "Adjustment for Exploration in Excess of Production", which seems to charge current rate payers for additions to a company's capital assets, is avoided.

This costing approach of capitalizing unsuccessful as well as successful well costs has substantial support within the accounting profession. Arthur Andersen & Co. has enunciated this position clearly and forcefully:

> "The purpose of exploratory activity is to discover oil and gas reserves for future use. Discoveries, however, are unlikely without the incurrence of some exploration costs for unsuccessful ventures. Such costs are necessary in the search for and discovery of new deposits of oil and gas reserves. Exploration costs for unsuccessful ventures are as much a part of the cost of the oil and gas discovered and produced as are the direct costs of productive wells.

"Only a portion of the oil and gas reserves discovered is likely to be produced and sold in a given year. The matching of related costs and revenues logically requires that the portion of all costs, including exploration costs, applicable to the oil and gas currently produced be charged to expense in the period of production.

"Because of the hazardous and speculative nature of the oil and gas industry, most companies have expensed their exploration costs as incurred. This practice has ignored the real capital nature of these costs, and has resulted in financial statements that do not show the total cost of the oil and gas reserves or of the current production therefrom. When exploration costs are charged to expense as incurred, profits are reduced or losses are shown in the exploratory years, because a substantial portion of the costs then being charged off does not relate to the income of the current period but to the income to be derived from future production of oil or gas."[1]

In addition, an excerpt from *Asset Accounting,* by William A. Paton, 1952 edition (pages 440 and 441) states as follows:

"In developing a wasting asset the costs of all explorations may be capitalized, even if some specific operations don't pan out, as long as the program is being carried on in a reasonable manner in the light of prevailing standards and techniques.

In the development of an oil lease, for example, several dry holes may be dug for each operation that proves to be productive. In this situation the cost of

[1] *Accounting for Oil and Gas Exploration Costs,* Subject File OI 2220, Item 124, Arthur Andersen & Co., January 1963, page 4.

> the dry holes may be regarded as a part of the cost of the activities that resulted favorably; like the falsework used in the creation of a building they represent preliminary operations necessary to the end result."

It should be emphasized, however, that this is not an endless road as the previous source cautions.

> "This interpretation, of course, must not be pushed to the point of justifying as assets the cost of development operations not warranted in the first place or long continued without success." (Paton, *Asset Accounting*, Ibid.)

Thus, while it may be appropriate to capitalize those unsuccessful ventures which can be related to the finding of successful production, this should not be interpreted as a blank check for loading the rate base with any other costs which have no bearing on productive properties.

Despite the seeming advantages of the project cost model, the record in this proceeding contains a meager amount of evidence directed to estimating a true yield rate of return and relatively much more directed to finding a rate of return under the comparable earnings test which is employed in the cross-section accounting method. With some reluctance in view of the size of the record here, I nevertheless conclude that the evidence on the critical aspect of rate of return on a true yield basis is not adequate to support the use of this method in this case.

My sole exception to the decision relates to the date of division between new and old gas which the majority fix to be January 1, 1961. I dissent to that finding because

it is fundamentally inconsistent with the very basis of the two-price system adopted by the majority. This system was first advanced by witness Kahn and applied by Roseman. Implicit and explicit in their testimony, and as the majority emphasize, the purpose of the two-price system, the purpose of a higher price for new gas, is to provide the incentive to find necessary new reserves. It is a rate designed to encourage the finding of gas in the future, for the future.

The majority's decision repeatedly emphasizes this rationale:

277,749

> "*Looking to the future* we are establishing a pricing system that will encourage the industry to expand and perfect its ability to drill directionally so that revenues from gas consumers can increasingly be devoted to finding additional gas reserves." (p. 29) (emphasis added)
>
> "The incentive is built into the two-price system. *It provides a price for the future* related to current and future costs and payable only to producers who discover gas-well gas and dedicate their discoveries to the interstate market. (p. 29) (emphasis added)
>
> "If a one-price system were to be adopted, average historical costs — not the highest current costs — would necessarily serve as its foundation, and we have no assurance that such a price would elicit the investments at current cost levels which are needed to bring forth adequate new supplies of gas-well gas." (p. 30)
>
> ". . . if such a ceiling were fixed high enough to elicit new gas-well supplies it would result in windfall profits for all other gas and if fixed low enough

to reflect costs for old gas it would not assure adequate supplies for the future." (p. 30)

". . . bring forth needed gas supplies in the future and this fact supports our conclusion to fix a higher ceiling for new gas-well gas which will encourage exploration at deeper horizons directed toward finding gas." (p. 32)

"The separate price we fix herein for new gas-well gas in the Permian Basin should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies." (p. 32)

It requires no lengthy citations from Webster's dictionary for one to understand that incentive or encouragement relates to the future — not to the past. No matter how hard it tries, the Commission simply cannot incite or encourage a producer to find and dedicate gas to interstate commerce which he is already selling, has been selling for up to four and one-half years, and for which he would need a specific order from the Commission before being free to discontinue.

277,750

Insofar as the majority relies on the issuance of the Policy Statement, the decision strikes a sharp blow at a basic purpose of the Natural Gas Act and the regulatory process. This Statement was issued without notice, without hearing, without any opportunity whatsoever for interested parties to comment. Reliance on such a Statement, the basis of which is devoid of support in the record, is improper. This is especially true since the Statement itself recited:

(277,750)

> "It is anticipated that these differences in price levels will be reduced and eventually eliminated as subsequent experience brings about revisions in the prices in the various areas."

How ironic it must seem to the consumers of this nation that the opposite is true — that our "subsequent experience" is viewed in the light of the Policy Statement.

Looking to the future, it is easy to see that this approach will result in a crazy-quilt maze of old and new gas prices, depending on irrelevant factors such as the length of time required to try the case, and the particular test year used. Thus, "new" gas-well gas can be four and one-half years old in Permian; but in South Louisiana, assuming (but not predicting) a final decision in 1967, "new" gas-well gas will be nearly seven years old! This is some legacy.

Irrespective of how this aspect of the decision is viewed, it makes no sense. I therefore dissent to this aspect of the decision. In my view, the new gas price should relate to gas sold under contracts executed after the date of this decision.

In response to this position which was advanced by the California intervenors, the majority has no rebuttal. It simply states: "We believe, however, that the intervenors' argument proves too much . . ."

Lastly, in order to avoid any future misunderstanding, I wish to note my disagreement with the modifications of the Examiner's method of determining the old gas price as set out in the majority's decision.

In summary, this opinion is a beginning — albeit a good beginning — toward implementing our responsibilities to establish just and reasonable producer rates. I believe that with improvements, including those here suggested which the Commission indicates a willingness to consider, we will make further progress toward achieving a fair and effective system of producer regulation.

Area Rate Proceeding Claude E. Aikman, *et al.* North Central Oil Corporation (Operator), *et al.*	*Docket Nos.* G-18466, *et al.* CI60-435, *et al.*

(Issued August 5, 1965)

BLACK, Commissioner, *Concurring:*

I join in today's historic decision but wish to express briefly my separate views with regard to the Commission's determination of rate of return.

In the final analysis the allowance for rate of return is a judgment consideration. With some reluctance I concur in the Commission's exercise of judgment that on the evidence before us 12% is not excessive. I do not feel, however, that the record strongly supports such a consideration.

Because of the great numbers of producers who are affected by our decision in this proceeding and in the area rate cases to follow, the importance of a careful rate of return determination cannot be over emphasized. Translated into terms of the price of Permian gas, the difference between Staff's recommended 9.5% and the Commission's 12% is about 1.5¢ per Mcf for both new gas-well gas and flowing gas. This means about $11 million *annually* to jurisdictional purchasers of Permian gas, or nearly $4.5 million for every percentage point of rate of return.

Serious deficiencies exist in the presentation both of respondents and of the staff on the rate of return question.

The Examiner's basis for adopting a 12% rate of return is equally unsatisfactory. It is based on the earnings experience of nine "highly successful" non-integrated companies whose sales represent only about 4.5% of all jurisdictional sales made in the Permian Basin. Of these nine companies (which in my view is a woefully inadequate number to constitute a representative sampling) only three producers are primarily responsible for bringing the earnings up to the 12% average. And of these three, two were the smallest of any of the exhibit companies. Their total 1960 United States pipeline sales were, respectively, 5.2 million Mcf and 3.2 million Mcf. Their Permian Basin sales were, similarly, but an infinitesimal part of the total. It is apparently conceded that the non-integrated producer is not typical of Permian Basin gas producers;

indeed, the conclusion is unavoidable. Respondents' witness stated on the record that the typical producer is the large integrated company, and that the non-integrated producers constitute a class that is constantly diminishing in number. It is inappropriate that they should have been separated out as the standard for employment of the comparable earnings test. They simply are not comparable.

The Commission avoids any discussion of the adequacy of the non-integrated producer as a basis for comparison and instead rests our case entirely on a discussion of the risks of natural gas production cast in the most general

terms. My colleagues employ as the starting point the rates of return allowed jurisdictional pipeline companies, which fall into the range between 6.0% and 6.5%, and then seek to establish that natural gas production is a riskier business than natural gas transmission. I agree; but the translation of this added risk in terms of percentage points of return on investment has only marginal support in the record and we should acknowledge this to be the fact.

The principal risk which characterizes the operations of the independent producer is, as the main opinion properly notes, the dry hole — or non-commercial well — risk. The Commission points out that we are allowing the recovery of dryhole and associated costs as operating expenses in determining the area price for gas, but goes on to observe that "the uncertainty whether productivity will meet the industry average nevertheless remains as a risk for *each individual producer* . . . ." We are not, of course, making rates on an individual basis. A return of 12% will not obviate the risk of each individual producer in the Permian Basin; nor for that matter will a 50% return. On the Commission's reasoning it could be argued that we would have to allow a rate of return which would cover the least successful operation in the area. A basic rationale of the area-pricing approach as noted more than once in the Commission's opinion is its inherent incentive to exploration. While individual producers may not, in fact, earn a given return on their investment, by the same token no individual producer is *restricted* to a particular return. Efficient, prudent man-

agement — or just plain good luck — can produce a return which in the context of individual company rate making would be termed vastly excessive. But under our approach such companies can keep the fruits of their good fortune.

277,753

We are making rates for the industry as a whole, and the Commission properly observes that "there is a degree of predictability to production operations as evidenced by the fact that the industry as a whole has maintained over extended periods a consistent record of new discoveries and added reserves."

The main opinion effectively disposes of the producers' case for a 16-18% rate of return, and I will not comment further. I do, however, wish to address myself briefly to Staff's approach, which was joined by the California distributor intervenors, with the hope that the records in future area proceedings will provide the Commission with guidance to decide the proper rate of return on a more informed basis.

Staff's evidence, related to over-all earnings experience on total capital, includes the following:

(1) A national group of 35 companies, including both integrated and non-integrated oil and gas producers accounting for some 60% of reported 1960 pipeline sales in the United States. The simple average earnings of this group for the years 1957-1961 amounted to 9.5%, the median 8.8% and the weighted average 9.3%.

(277,753)

(2) A selection of 31 companies in the Permian Basin (again including both integrated and non-integrated producers) selling 81% of all the gas sold in the Permian Basin in 1960. The same averaging techniques as applied to the national group produced returns of 9.5%, 8.9% and 9.3%, respectively.

Staff also made use of data published by financial institutions, notably the Chase Manhattan Bank and the First National City Bank of New York. The results (both for total manufacturing and for petroleum production and refining) are not markedly different than those produced by Staff's special studies. These statistics, together with information taken from the well-known *Fortune* magazine study of the 500 largest industrial companies, address themselves separately to a return on equity capital. Although today's Commission opinion does not speak in terms of a return on equity, it is nonetheless a traditional and important tool in arriving at a proper rate of return. Using Staff's selected integrated and non-integrated companies, an over-all rate of return of 12% translates into 13.5% return on equity, assuming an equity ratio of 85%.

277,754

Chase Manhattan's group of companies (including Staff's selection) for the entire period 1934-1961 earned 9.44% on average total capital and 10.46% on average equity capital. For the five-year period 1957-1961 earnings on average total capital were 9.56% and 10.44% on average equity capital.

The First National City Bank figures, which included data for a large number of companies representing total manufacturing and a substantial group (124 in 1961) of petroleum production and refining companies, show for the petroleum companies a return of 9.66% on equity for the entire period 1925-1961 and 10.88% for the five-year period 1957-1961.

The *Fortune* study discloses an average of the mean rates of profit on equity for the petroleum industry to have been 8.88% for the years 1957-1961.

I cite these figures, not in an attempt to establish that the Commission's rate of return determination is erroneous, because I recognize that these statistics are in many respects not comparable and are likely subject to a variety of infirmities which make them inappropriate for the Commission to rely heavily on. My purpose is to indicate my belief that an over-all rate of return allowance of 12% is very probably a generous one.

In my view the principal infirmity in Staff's approach is the assumption that the unallocated earnings of the integrated producers necessarily reflects the level of earnings and thus the appropriate rate of return for the separate function of their gas production departments. Staff's position that the non-production operations of the integrated producers are riskier than those of gas production rests largely on argument. While it is true that the far-flung and diverse operations of the large integrated producers may be at least as risky over all as the production of natural gas, the record does not affirmatively support such a conclusion.

The Commission opinion asserts that "integrated returns are relevant to the instant issue" but notes that "Without a departmental segregation of costs and revenues, it is impossible to calculate production department returns."

Whether such a segregation can be made on another record or whether some other reliable means can be devised more accurately to reflect the earnings of gas producers on their jurisdictional investment, I express no opinion. I

only emphasize my strong hope that the Commission's determination of rate of return will not be understood as some kind of immutable standard which we have developed in this pilot decision, or that it will discourage the vigorous and imaginative prosecution of the rate of return case in future area rate proceedings.

Perhaps the most important single reason for a liberal rate of return allowance in the Permian Basin is that the greater part of Permian gas is substantially below pipeline quality. The Commission has provided for downward price adjustments to reflect these quality differentials with the result that much of the gas sold will not command the ceiling prices we have established.[1] The very strong likelihood that the producers will continue

[1] It should be noted, of course, that our allowance of upward adjustments in price to reflect heat value in excess of 1,050 Btu's without a corresponding downward adjustment until Btu content falls below 1,000 undeniably constitutes something of an offset to the producers' risk.

to find large amounts of substandard gas is characterized by the main opinion as a risk factor, and I agree that it is appropriate to reflect this special risk in rate of return, which may well be sufficient to justify a return allowance of 12%.

With the reservations noted above, I expressly concur.

/s/ DAVID S. BLACK
David S. Black, Commissioner

Part III

The following proceedings involving proposed increases in rates were consolidated. Proceedings marked with "*" are consolidated only insofar as they pertain to the Permian Basin, New Mexico and Texas Railroad Commission Districts Nos. 7-C and 8 areas. Regarding proceedings marked with "**", there remains open the question of the contractual support of the respondents to make the increased rate filings. This question will be determined in Amerada Petroleum Corporation, *et al.*,

APPENDIX B, Docket Nos. AR61-1, et al.

The following discussion from the presiding examiner's initial decision, Appendix B, pages 84-85, is adopted by the Commission:

E. DRY HOLE COSTS

Roseman and Park divide dry hole costs on the basis of the relationship between successful oil and gas well footage averaged over a period of years. While this method might not be suitable for dealing with the dry hole costs of an individual company due to the variations in annual success ratios and productivity of successful drilling, as Respondent witness Porter showed, these variations tend to be minimized in the magnitude of the industry's total effort over a period of years. Therefore these witnesses' basic approach is sound on the industry level.

For the period 1955-60, Park determines the average annual dry hole footage and successful footage, separately for exploratory and developmental footage. This shows that 6.4 feet of dry holes were drilled for each successful exploratory foot, and 0.3 feet per successful developmental foot. These numbers are multiplied by the average annual gas footage, broken down between exploration and development, thus arriving at the total dry hole footage to be borne by gas well gas. The total is then multiplied by the JAS 1960 average cost per foot for dry holes. The result is divided by the average annual reserve additions of gas well gas to produce 1.56 cents per Mcf for dry holes. Park thus allocates dry hole costs

(277,782)

in proportion to the relationship between successful gas footage and total successful footage.

Roseman also divides his dry hole footage between gas and oil in proportion to successful gas and oil footage, separately for "wildcat"[3] and other footage. He derives a combined ratio of 0.898 feet of dry hole per successful gas well footage as the weighted average for the period 1951-61. (The corresponding ratio for Park for the period 1955-60 is 0.891.) Then he takes the cost per dry hole foot drilled from the Census for 1958 and after adjustment computes the cost per Mcf of dry holes drilled.

Roseman makes three adjustments to the dry hole foot cost figure of $8.91, the Census figure for 1958.

The Appendix figures show a decline of 3.5 percent in dry hole drilling costs from the peak year 1958 to 1960. For the reasons previously given, it is appropriate to adjust the 1958 Census level by the trend actually experienced by the constant sample of companies in the Appendix. This adjustment reduces the cost per dry hole foot to $8.60 per foot.

Roseman makes a second adjustment to take account of the fact that gas wells are typically deeper and therefore more expensive than oil wells. Using the *Oil and Gas Journal* figures which show drilling footage by depth and by well type, and Appendix data which shows the

[3] *World Oil*, on which Park and Roseman rely for allocating dry hole costs, provides a breakdown between "wildcat" and total drilling. It appears that the term exploratory as used here by Park corresponds to the term "wildcat" used in *World Oil*.

Appendix cost per foot for 1960 in the various depth ranges, he finds that the average cost per foot of dry holes allocated to gas was 12 percent greater than it would have been, if depth had been disregarded.

Again, analysis of the figures allocated to gas by Roseman on the basis of successful wells at various depth ranges, indicates that the footage allotted to gas is 4 percent less than if, disregarding depth ranges, the allocation were made simply on the ratio of total successful gas well to oil well footage. This

is a statistical indication that deeper wells tend to have a higher success ratio. The combination of the second and third adjustments, an increase in cost of 12 percent for greater depth and a reduction of 4 percent for greater success ratio, results in an upward adjustment of 8.28 percent.

The adjusted cost per foot figure is $9.31 per foot which produces a cost of 1.42 cents per Mcf.

Roseman's trended Census cost per foot is preferred to Park's JAS cost. The JAS sample average cost reflects the overrepresentation of large producers, their deeper than average drilling, and consequent higher than average cost per foot. Roseman's adjustments which reflect the effects of depth and success ratios for gas wells are sound refinements. For these reasons Roseman's estimate of 1.42 cents is accepted.

The following discussion from the presiding examiner's

initial decision, Appendix B, pages 80-83, is adopted by the Commission:

B. LEASE ACQUISITION COSTS

Park, Roseman and Sherwin estimate lease acquisition costs for gas well gas on the basis of the relationship between lease acquisition costs and successful well drilling costs.

Data on leasehold acquisition costs in relation to successful drilling costs are available from the Staff Appendices B and C, the *Joint Association Survey* and the Chase Manhattan Bank's *Annual Analysis of the Petroleum Industry 1961* (Chase). Ratios between leasehold acquisition costs and successful drilling costs cannot be computed from the Chase data alone because the Chase drilling costs include lease equipment costs which cannot be broken out. However, the Chase figures for lease acquisition costs are separate. Roseman used this data and related it to the trended Census drilling costs (the Chase-Census results). The ratios from the above sources are shown for recent years below.

There is difficulty in using the data on this subject.

1. Lease acquisitions vary considerably from year to year and are significantly influenced by Federal offshore lease sales at which large blocks are sold at irregular intervals, chiefly to large producers. As shown below, the expenditures for leaseholds by the small producers have been stable in relation to drilling costs, while the expenditures of the large producers have varied significantly. Given the variability in the ratios, it is desirable to consider the results

Ratio of lease acquisition costs to successful well costs (percent)

	JAS	Roseman	Staff summaries	
			Respondents Over 10 million	Respondents Under 10 million
	(1)	(2)	(3)	(4)
1955	36	36	N.A.	N.A.

for a number of consecutive years. The JAS does not report any results for 1957 and 1958. The Chase-Census figures are available over a span of years and the Appendix data covers 1956-60.

* * *

To relate lease acquisitions to drilling cost, Roseman estimated drilling costs for oil and gas separately from the

Census for 1958 and trended these results on the basis of the Appendix A experienced costs from 1957-60. The per foot results for oil and gas were applied to the total footage drilled of oil and gas wells as reported in *World Oil*, to obtain the total drilling costs for each year. As previously discussed, trending the drilling data on the basis of the trends shown in the Appendix A is a sound method for determining trends in drilling costs. Trending the 1958 drilling costs downward increases the ratio of lease acquisition costs to drilling costs. Roseman then relates the industry wide lease acquisition data of the Chase analysis to the trended industry drilling costs. He considers the annual ratios from 1955-61 * *

and correctly found no trend. He then determines the weighted average ratio for the years 1957-60 to be 26.4 percent, which provides a representative sample of years in which lease acquisition costs were at high and low levels. Applying this percentage to his drilling cost of 2.88 cents per Mcf for successful gas wells, determined from the first step, yields 0.76 cents per Mcf.

Sherwin's estimate for the relationship between lease acquisition costs and successful well costs is in the range of 33 to 37 percent. He begins with the Appendix data which for the years 1956-60 average 42 percent for the large producers and 26 percent for the small producers. He also considers the lower estimates of JAS and Chase. JAS doesn't cover the years 1957 and 1958, which the other estimates show were the two lowest years in any of the series. It is evident from the preceding table that for all the years JAS is available 1955, 1956, 1959, 1960,

1961, its ratios are never more than two percentage points higher than the Chase-Census ratios.

Sherwin's major reliance is the Appendix data for the large producers. The ratios for these large producers are much higher than either the JAS or the Chase-Census ratios. The ratio of 67 percent for 1960 is 29 percentage points above the JAS figure for that year and 30 points above the Chase-Census ratio. This last variance is probably due in part to extensive purchases by large producers of offshore leases at the federal sales occurring that year. Such lease sales are in the main confined to large producers and their affiliates, and are generally in large amounts. These transactions are reflected to a greater degree in the Appendix results for the large producers than in the JAS or the Chase-Census results, because the national Appendix data underrepresent the small companies to a greater extent than the other two. Sherwin's upper limit of 37 percent is based in the main on an apparent trend in the results for the large Appendix producers for 1958, 1959 and 1960, 39 percent, 43 and 67 percent, respectively, although on other occasions he criticizes the use of Appendix data even for trending purposes. During this same period there is no trend in the ratios of the Appendix small producers. That three years is too short a period to establish a trend for this purpose is shown by the downward movement in 1961 for both the JAS and the Chase-Census ratios. In March 1962 there were large sales of offshore leases, and the 1962 data will probably reflect this, but the whole picture still indicates variability but no trend. Sherwin's estimate,

being based largely on the least representative data, is rejected.

277,785

Witness Park combines his estimate for lease acquisitions with that for lease facilities. He estimates that these two items should amount to 50 percent of his already determined drilling costs per Mcf. Park's estimate is based in large part on his judgment and experience as an official of Texaco. He considered the JAS average results for these items for the years when this survey was published and the 1956-60 Staff average results for all Appendix B producers. Both show a ratio of 59 percent for lease acquisition costs and lease production facilities in relation to drilling costs. Park first adjusts this percentage downward to reflect the fact that lease production facilities are more extensive on oil leases. He then adjusts the percentage upward to a lesser extent to take account of the fact that gas wells are more widely spaced and drain a greater acreage than oil wells. These two judgment adjustments resulted in a net downward adjustment to 50 percent, of which Park assigns 40 percent for lease acquisitions and 10 percent to lease production facilities.

Park's 40 percent figure is higher than the JAS average ratio. Moreover, as previously noted, the JAS was not published for the years which the Chase-Census and Appendix ratios indicate were the two lowest in their respective series, 1957 and 1958. And, as previously noted, the JAS average is probably too high because it is overweighted by large companies whose acquisition

costs are a higher proportion of well drilling costs than is true for the small companies. The average ratio for the years 1956-60 for all the Appendix B companies is 42 percent. The upward bias in the ratios resulting from the unrepresentativeness of Staff's companies has been discussed.

Park's upward adjustment is based on his experience that the spacing of gas wells is typically wider than for oil and therefore uses more acreage. He also gives his opinion that gas acreage is not correspondingly cheaper than oil acreage. He cites no study or data in support of his conclusion. He does not appear to have considered the relative values of oil or gas prospects. Park does not mention the factor that the drilling cost for gas wells is typically greater than for oil wells because of the greater depth of gas wells. This would tend to offset the effects in the relationship of possibly higher acquisition costs for gas acreage.

The record contains a single study which indicates that the cost of lease acquisitions for gas has not exceeded those for oil. In Schedule 7 of his Exhibit 224, Roseman relates the capital accounts for lease investment to the investment in lease and well equipment plus drilling cost for successful wells, classified by lease types. In other words he takes the gross historical investment in lease acquisitions for successful gas aid oil leases, and relates this amount to the corresponding gross historical investment in successful wells and lease equipment. The study shows that lease acquisition investment was 22 percent for gas leases and 20 percent for oil leases. There

is no dispute that lease facility costs on successful oil leases are generally considerably greater than on gas properties. Hence it is probable that if the ratios were limited to the capital accounts for lease acquisition and successful wells, excluding the lease facilities, they would show that the ratio for gas leases was the same as or lower than for oil leases. In any event, the study indicates that the ratio of investment in lease acquisitions to total investment for successful leases is not significantly greater for gas than for oil. This study covers productive leaseholds only. The witness concludes that this limitation doesn't affect the comparison. There is no reason to expect that the respective ratios for oil and gas leases would be changed if leaseholds which are acquired and never go into production were to be included.

There is no evidence that recent investment in gas or oil leases would change the above ratios.

While not conclusive, this study indicates that it is a reasonable hypothesis that the ratio of lease acquisition costs to drilling costs is not significantly different for gas than for oil leases.

It is concluded that Roseman's estimate based on the Chase-Census ratio furnishes the most reasonable estimate for lease acquisition costs. Applying Roseman's ratio to his drilling costs yields 0.76 cents.

277,786

An analysis of the percentages in the table at the bottom of page 2 of this appendix setting out ratios of lease

acquisition costs to successful well costs indicates additional grounds for supporting the presiding examiner's determination of lease acquisition costs. As the examiner noted, in each year for which JAS percentages are available they correspond closely to the Roseman percentages. In 1955 the two figures were the same; in 1956 the JAS figure was one percentage point higher; in 1959, 1960, and 1961 the JAS figure is higher by two percentage points. For 1957 and 1958 no JAS figures are available but the close correlation of the figures of JAS and Roseman for the years in which data is available would indicate that if JAS figures had been available for 1957 and 1958, they would have been close to the Roseman figures of 20 percent for 1957 and 23 percent for 1958. This would indicate than an average of the available JAS figures would be misleading and that a more representative average could be obtained by including figures for 1957 and 1958, based on the observed relationship to Roseman's figures. With this adjustment, the average of the JAS figures would be 28.5 percent, as compared with the 33 percent which is the average of JAS figures actually available. It seems clear therefore that the Roseman figures of 26.4 are not too low and we agree with the examiner that they should be accepted for the purpose of computing the lease acquisition cost.

APPENDIX C, Docket Nos. AR61-1, *et al.*

DETAILED ISSUES IN COMPUTING THE COST OF OLD GAS WELL GAS

In this appendix we shall discuss in more detail several of the issues raised in connection with the historical cost of service determination of the cost for flowing gas at pages 78-89.

Gas-Well Gas Produced from Combination Leases

Basic to the determination of production costs for old gas-well gas is the question of which lease categories should be included in the determination of such costs. There is no controversy over the inclusion of leases covering dry gas as well as gas condensate with and without lease separation. An issue has been raised, however, with respect to the inclusion of the so-called "combination lease", a term used to classify leases producing, or capable of producing, from both oil and gas reservoirs.

In computing its composite cost of gas-well gas, the Staff included data relating to gas-well gas from the combination leases for both production costs and for its E&D allowance. The producers concur in Staff's method insofar as it relates to E&D but contend that data from combination leases should be excluded from consideration in the production expenses and investment costs of gas-well gas because they involve unnecessary and unreliable additional allocations. The examiner pointed out that large amounts of gas-well gas are produced from the

combination leases and that there are economies of joint operation which should be reflected in the costs.

Our decision to base the price of flowing gas upon the cost of gas-well gas was based in part on an effort to minimize the number and complexity of the necessary allocations. Furthermore, because the liquids represent a much smaller portion of the total in gas-well gas than in oil-well gas,

277,788

such a cost is less dependent on allocations and more nearly represents an objective cost for the gas. With this in mind we must observe that to compute the corresponding production expenses and investment costs attributable to gas-well gas on the combination leases will require two distinct stages of allocations. The first stage is to divide the combination lease costs between all gas and all liquids by the use of the relative cost method. This must be done for all gas-well gas. However, there must then be a further breakdown of the costs assigned to gas between dry gas, condensate gas, with and without lease separation, and casinghead gas. This is a complex process, involving allocation formulas which are necessarily subject to dispute. Only when this step is taken can costs related to gas-well gas from combination leases be computed. If combination leases are excluded from the compilation of production costs the more complex two-stage allocation is avoided.

To utilize the costs of combination leases in determining production costs would involve the additional allocations which we believed should be avoided and would

thus defeat a major purpose of limiting the cost to non-associated gas. There is nothing in the record to support the examiner's suggestion that somehow gas-well gas can be produced more economically on a combination lease. We believe the production expense and investment data for gas-well leases which cover some two-thirds of the gas-well gas produced in the area is fully representative of the costs for gas-well gas. Accordingly, combination leases will be excluded from the production cost computation of gas-well gas.

The use of combination leases in the computation of E&D, however, presents no further allocation problem. There are no E&D expenses directly associated with the combination leases. All that is needed to make the E&D computation are the volumes of liquid and gas produced from each type of well, and such volumes are available. Accordingly, we find that the data from the combination leases should be included in the calculation of E&D, which is consistent with the positions taken by both staff and respondents.

277,789

Allocation of Overheads

In addition to the costs directly associated with the producing leases there are certain costs which are incurred in connection with the producers' overall activities. These are corporate general costs and expenses, area and district costs and expenses, prepaid taxes and insurance, corporate general net investment, area and district net investment, and materials and supplies. Such overheads must first be allocated between operating functions (such

as production and E&D), then between lease types, and finally between the gas and liquid products. There is no controversy about the allocation between operating functions, which was performed in most instances by the reporting companies themselves. The specific issue concerning these overhead expenses is the allocation of such costs between the various types of leases.

The Staff allocated these overhead expenses to leases on the basis of direct lease costs and expenses, exclusive of DD&A (depreciation, depletion and amortization) for items which are expensed, and on the basis of relative gross investment in the leases for capital items and the materials and supplies. On the other hand the Major Producer Group would add DD&A to the direct lease cost and expenses as a basis for allocating the common, or overhead, expenses and would use net investment in the leases as the basis for allocating capital items and the materials and supplies.

The examiner adopted staff's methods of allocation, and we affirm the examiner's finding. First, as to the issue whether the overhead expenses should be spread over all of the direct expenses including DD&A, it is clear that they should not. Overhead expenses are largely supervisory expenses and have no bearing on DD&A, which are bookkeeping entries to reflect the use of the investment. They should be allocated on the basis of direct expenses being supervised, which are exclusive of DD&A.

The second question is whether to use gross or net investment as the basis for allocating capital items and materials and supplies, two of the items in the overhead

category. In allocating the common investment items, gross investment more closely reflects management supervision than net investment which is affected by the amount of gas or oil already produced. The same is true for materials and supplies because such expenses continue regardless of whether the investment has been reduced by depreciation and depletion. We shall, therefore, allocate these two items on the basis of gross investment.

277,790

Reinjected Volumes

An important question relating to the volumes used in computing the cost of flowing gas is the treatment of gas that is produced from the well, but is reinjected for the purpose of improving operating efficiency and increasing the recovery of liquids. If the reinjected volumes are included the effect is to reduce the unit cost of gas sold below what it would have been if costs were applied only to volumes sold, and the volumes produced but reinjected were disregarded. This is true because the same costs would be spread over a greater volume.

Respondents maintain that reinjection operations relate only to cash production expenses, and that except for these expenses all other costs should be computed on the basis of the volumes sold, which would be a smaller volume (and at higher cost) than if the total volume produced including the volumes subsequently reinjected were used. On the other hand staff maintains that all costs — cash productions cost, DD&A, return on investment

and exploration costs — should be applied to total volumes produced regardless of their disposition.

The use of total production volume, rather than sales volume, in computing the cost per Mcf assures that the share of total production costs related to the liquids derived from reinjected gas are in fact borne by liquids. For example, costs of recycling include investment in reinjection wells and other equipment, which should be borne by the liquids. In our opinion the use of production volumes, an approach which was adopted by the examiner, is the proper one. The cost of obtaining the liquids is not confined to the current expense of lifting, processing, and reinjecting the gas; all the other expenses, such as production investment and the like, are necessary as well. If they were not incurred, there would be no gas to recycle for the benefit of the liquids.

The conclusion is in accord with our prior decision on this issue in *H. L. Hunt, et al.*, 28 FPC 897 (1962). In that case the Commission stated that production volumes rather than sales volumes should be used in cost computation, and specifically mentioned recycled gas as included in production volumes.

277,791

* * * For example gas that is recycled, gas used for off-lease purposes, gas used by other departments in drilling or production, and gas shifted to company gathering systems or plants all represent situations in which substantial volumes of gas may have been produced but would not be included in sales volumes.

> The overstatement of the unit cost of single product gas inherent in the use of sales volumes also distorts the allocation of joint product costs. For example it is obvious that under the relative cost method too much of the joint production costs will be allocated to gas if the production cost of gas-well gas has been overstated. [.902]

Application of Relative Cost Method

A. *General Approach*

As a preliminary matter we are confronted with a dispute over methodology. Phillips' Witness Cramer presented a variant of the relative cost method which has been referred to as the "Y" Ratio method. The relative cost method relies on an allocation ratio based on single product costs, but the "Y" Ratio method includes in its base the costs and production of joint products, which are the very costs to be allocated by the ratio to be derived.

The "Y" Ratio method requires the use of a cubic equation and results in a mathematical formulation that is solved with a computer. Complicated formulas, even mathematical ones, do not necessarily produce meaningful results. We are persuaded that the method proposed by Witness Cramer creates only an illusion of precision and is less meaningful than the relative cost method of allocation. Under these circumstances we agree with the examiner that no reason has been shown to adopt this method.

In applying the relative-cost method there are three detailed issues on which staff and the producer-respondents differ. One is whether gas condensate leases should be included in the gas leg, a second is whether shut-in

leases should be included in the oil and gas legs, and the third is whether the joint products should be allocated on the basis of gross investment rather than on the basis of net investment.

277,792

B. *Gas Condensate Leases*

The Staff in deriving a gas leg added to the dry gas leases, the gas-condensate leases without lease separation but excluded the gas-condensate where lease separation occurred. Respondents argue that all condensate gas, both where lease separation took place and where it did not, should be included in the gas leg. In support of their position respondents urge that there is no difference from an operating and well investment standpoint between gas condensate leases and the dry gas leases which were included, and that all the gas condensate leases should be included to reflect representative conditions relating to production on joint product leases, because otherwise the gas leg is too small to be representative.

Essentially the respondents argue that all gas condensate production should be included in the gas leg because gas condensate and dry gas leases are similar. Their argument misses the point. Obviously if there is sufficient dry gas to provide a representative gas leg, no gas condensate at all should be added. If not, the issue is the extent to which gas-condensate lease types need be added to achieve representative conditions.

Producers responding to the Commission questionnaire for the major producers (Appendix B) produced

41,652,569 Mcf of dry gas in the Permian Basin in 1960, about 4 percent of their total gas production in that area. In computing the Permian Basin gas leg of such producers, staff added to this dry gas production 1,271,495 Mcf of gas-condensate gas produced by them from leases without lease separation.

In the past, in cases dealing with individual companies, the Commission has considered that a dry gas leg representing as little as 4 percent of the total gas production of a company was an inadequate sample, and has indicated that there should be added to the gas leg a portion of the gas condensate production for the purpose of obtaining a larger sample. *H. L. Hunt, et al., supra; Hunt Oil Company, et al., supra; Union Producing Co., et al., supra.* In none of these cases, however, did the amount of dry gas production approach

the 41,652,569 Mcf of dry gas which would be the sample here if the gas leg were restricted to dry gas. Also, in the three cases cited, we were dealing with the nationwide production of individual companies and the only practicable method of enlarging the sample was to depart from a strictly single product leg and include a portion of the company's gas condensate production. In the present proceeding, however, if it were determined that the 41,652,569 Mcf of dry gas produced by the major producers in the Permian Basin were an inadequate sample it would still be possible to maintain an all dry gas leg by using the national production of dry gas by the same

companies. Although the nationwide production of dry gas by these companies is only approximately 13 percent of their total gas production, it amounts to 862,395,237 Mcf annually, a production several times larger than all of that used in computing the gas leg in *Phillips Petroleum Company, supra,* (226,681,178 Mcf). There is no question that the 862,395,237 Mcf is a sufficient volume for an adequate sample.

The total costs allocated to gas by the relative cost method vary only in a negligible amount, whether national production or Permian Basin production of dry gas is used as the sample. The Staff's inclusion of gas condensate without lease separation also has little effect. The computations of production costs are as follows:

Type of gas leg used	Gas-well gas Costs in Cents per Mcf (at 12% rate of return)
Nationwide Dry Gas Production[1]	9.136
Permian Basin Dry Gas Production	9.157
Permian Basin Dry Gas + Gas Condensate Without Lease Separation	9.161

[1] This computation has been made using Permian Basin cost data but applying an allocation ratio derived from national statistics. We reassert that for flowing gas the area costs are to be used in computing production costs. The use of the national dry gas volumes would be for the sole purpose of developing allocation ratios.

It will be noted that the costs, as computed on the basis of an allocation ratio derived from national production, differ by approximately .02 cent per Mcf from the compu-

tation of such costs derived from the ratio of dry gas production in the Permian Basin, and that the ratio derived from Permian Basin production is more favorable to the producer-respondents. The computation actually used by the Staff, which included gas condensate without lease separation in determining the allocation ratio, varies from the determination made on the basis of the Permian dry gas only by approximately .004 cent, and, again, the miniscule difference is favorable to the producer-respondents.

We think that if there is an insufficient area dry gas leg the use of national dry gas production would be preferable to the inclusion of gas condensate production for the purpose of determining the allocation ratio. However, where an area gas leg is derived from dry gas volumes of 41,652,569 and where the use of national dry gas production would produce a result equivalent to use of the area dry gas production, we believe it is proper to use the area production leg. Since the inclusion in the gas leg of the small amount of gas condensate by staff resulted in such an insignificant difference in cost, for the purposes of this case we will adopt Staff's computation. Regardless of which of these two computations we choose, it would not alter the cost sufficiently to affect the price of old gas-well gas as herein determined.

C. *Shut-in Leases*

Staff in computing its gas leg and oil leg excluded shut-in leases for purposes of determining the allocation percentages, although the actual cost of the shut-in leases in the joint lease category is, of course, included in the

joint cost when the allocations are applied. Respondent-producers contend that shut-in leases should be included in determining the allocation percentages, because they are part of the cost of producing gas and shut-in oil leases are part of the cost of producing oil. The issue has been previously determined by this Commission. "Non-producing properties should not be included in ascertaining the oil and gas legs for allocation of the joint production costs." *Hunt Oil Co., et al.*, 28 FPC 623, 624 (1962). Shut-in lease costs are not representative of the production costs of either gas wells or oil wells because they are essentially non-producers. Their inclusion in the oil and gas legs would distort an otherwise representative single product cost factor and thus defeat the underlying principle behind the relative cost allocation method.

277,795

D. *Gross or Net Investment*

In computing the gas leg and oil leg for determining the relative cost of the joint production, the separate costs of each product must include an element of return on investment. Rather than using net investment, Staff would allocate the return allowance on the joint production on the basis of gross investment in leases producing separate single products. Respondents would use net investment. They argue that the use of gross investment overlooks the fact that this particular use of the relative cost theory is applied to production investment for the sole purpose of computing a return on investment, and

that such return is computed on net investment, not gross investment.

The fact that the purpose of the allocation is to compute a return on investment is irrelevant, the test being which method more nearly reflects the operating facts of the joint production. The basic fact which raises the issue between gross and net investment is that oil-only leases are generally more depleted than dry gas leases.[2] Thus, using net investment would tend to assign less cost to oil and more to gas than if gross investment is used. On joint product leases (except some combination leases), the depletion rate is the same for liquids as for gas. Allocation on the basis of the gross investment more nearly reflects that fact. If net investment is used as the basis for the allocation it would impose a comparatively greater burden on gas than oil because of the relatively lower net investment of the oil-only leases which are more depleted. Its use would not reflect the true state of affairs on many joint product leases. We shall, therefore, use gross investment for this allocation.

277,796

Lease Play Allowance

In our calculation of working capital for new gas, we included an additional allowance for lease play over and above the working capital allowance which would be

[2] Oil leases average 62 percent depletion, nationally, and 55 percent in the Permian Basin, contrasted with an average depletion for dry gas leases of 40 percent nationally and 37 percent in the Permian Basin.

justified under the traditional utility method.[3] The question arises as to whether this additional allowance should be permitted in the cost computation for flowing gas. In *Hunt Oil Company*, 28 FPC 623 (1962) and in *Union Producing Company*, 31 FPC 41 (1963) the Commission denied lease play allowances on the ground that since a year-end rate base was being utilized such an allowance was unwarranted. The rationale for this finding was that any money expended to obtain leases during the year would receive a full year's return, even though such properties may have been purchased late in the year. These cases were not precedents for excluding a lease play allowance under our new gas calculation since an average-year rate base and not a year-end rate base was being used. However, in the development of our composite cost of service for flowing gas, we are using a year-end rate base. Accordingly, in view of the findings made in the *Union Producing* and *Hunt* cases no additional allowance for lease plays is included in the cost calculation for flowing gas.

[3] In our computation of the new gas cost, there is a separate classification for working capital. In the development of a composite cost of service the working capital allowance is not set out separately but is combined with investment in property under the separate cost computation for production cost and E&D cost.

Computation of E&D Allowance

The Commission utilized the modified Btu method in allocating E&D costs. In its application of this method the Commission used an economic factor of 3.5 for lease liquids and 1.0 for all gas. The E&D costs related to the Appendix "B" respondents are set out on the following page of this appendix. The results are summarized below.

E&D Allocated to Gas-Well Gas

	Cost (Return at 12%)	Unit Cost (Return at 12%)
		¢ per Mcf
Expense	$167,036,961	3.46¢
Return[4]	30,010,322	0.62
	$197,047,283	4.08¢

[4] In the costing of old gas, certain costs classified as E&D costs are "capitalized" and made part of an E&D rate base, while certain items are "expensed." In deriving the cost of new gas, no items except "expensed" items were classified as E&D, and, therefore, no separate E&D rate base was developed. All new gas cost items which were capitalized, regardless of whether they were applicable to E&D or production, were put into the production investment rate base. This distinction between old and new gas is one of accounting classification. The final cost computation under either method is not affected by this difference.

NOTE:
THE TERMS HEREIN ARE THOSE USED IN THE OPINION OF THE FEDERAL POWER COMMISSION IN PERMIAN BASIN AREA RATE PROCEEDING, AR61-1. NEW GAS-WELL GAS IS NATURAL GAS DERIVED FROM GAS WELLS MOVING UNDER CONTRACTS DATED ON OR AFTER JANUARY 1, 1961. THE BURDEN IS UPON A PRODUCER TO ESTABLISH THAT PARTICULAR GAS IS NEW GAS-WELL GAS OR RESIDUE GAS DERIVED THEREFROM, AND ALSO TO ESTABLISH THE PERCENTAGE OF SUCH GAS PRESENT IN A SALE OF MIXED GAS.

* Btu price adjustment to be applied in case of new gas well gas only.

APPLICATION FOR SMALL PRODUCER CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Section 157.40 of Regulations)

NOTE: Independent Producers of natural gas whose total jurisdictional sales on a nationwide basis for the preceding year, combined with those of " affiliated producers, " were not in excess of 10,000,000 Mcf may file the information called for in the following forms(In four copies, to the Federal Power Commission, Washington D.C.,20426.) Include volume of gas paid for but not taken under prepayment clauses or otherwise, and volumes of gas sold under other independent producer rate schedules in the proportion that the independent producer seeking to come with Section 157.40 has an interest in such sales. Do not include sales made pursuant to percentage sales contracts. If insufficient space is given for a complete answer, continue the answer on the reverse side, noting the relevant number.

	Docket Nos.
Area Rate Proceeding	AR61-1, *et al.*
North Central Oil Corporation (Operator), *et al.*	CI60-435
Socony Mobil Oil Company, Inc.	CI61-34
Robert T. Brown (Operator), *et al.*	CI61-733
Texaco Inc.	CI61-879

ORDER ISSUING CERTIFICATES
(Issued August 5, 1965)

By Opinion No. 468 and order in this proceeding issued concurrently with this order we have prescribed the just and reasonable rates for jurisdictional sales of natural gas in the Permian Basin area. There are four applications for certificates of public convenience and necessity which were consolidated in this proceeding and these are the subject of the present order. Temporary certificates have been granted to all four applicants and the gas is now flowing in interstate commerce.

The only issue presented by the applications is the initial price at which the gas is to be certificated. As we stated in Opinion No. 468, the just and reasonable area rate fixed therein constitutes the "in line" price required

by the public convenience and necessity in granting permanent certificates. All of the applications involve "flowing gas" as defined in Opinion No. 468, produced in Texas. The applicable area rate is 14.5 cents per Mcf at 14.65 psia adjusted to reflect any quality deficiencies in the gas and we shall therefore grant the certificates conditioned to an initial price no higher than the applicable area rates. The certificates shall be subject to the moratorium on any rate increase filing in excess of the applicable area rate prior to January 1, 1968, as provided in Opinion No. 468, pp. 107-113.

277,802

Each of the certificate applications has a somewhat different history from the others and also differs in its contract provisions. We shall therefore discuss each of them separately.

The proposed rate schedule of *North Central Oil Company* (Operator), *et al.*, Docket No. CI60-435, contains provisions specifying that the gas must equal or exceed in every particular the pipeline quality standards established in Opinion No. 468. A permanent certificate will therefore be issued in this docket providing for an initial price of 14.5 cents per Mcf at 14.65 psia. The temporary certificate contained no refund condition but a rate increase was filed during the period of the temporary. The increased rate was suspended pursuant to Section 4(e) and has subsequently been collected subject to refund, Docket No. RI65-288. The last-mentioned docket has not been consolidated herein and accordingly the question of refunds in that proceeding will be disposed of

pursuant to the Order to Show Cause issued this date. The question of whether refunds should be ordered during the period of the temporary when no express refund obligation was operative, but prior to the effective date of the proposed increased rate, will be deferred until our decision of the same issue in Skelly[1] and Amerada[2].

Robert T. Brown (Operator), et al., Docket No. CI61-733 involves sales made under a temporary certificate without an express refund condition. The related contract contains provisions requiring gas moving under it to equal or exceed pipeline quality standards in all respects save for hydrogen sulphide and total sulphur. The permanent

certificate will provide for an initial price computed by modifying the ceiling price of 14.5 cents per Mcf by deducting therefrom the cost of processing the gas to meet the pipeline quality standards for the Permian Basin. Accordingly the producer (unless these sales qualify as small producer sales as defined in the rule proposed this date providing for small producer certificates for such sales) shall, within 90 days of the effective date of this order, file a statement which shall state either that the gas accords with all pipeline quality standards established in Opinion No. 468 or in which respects the gas deviates from such standards, the agreed cost to the buyer of processing the gas to bring it to the quality standards with

[1] Skelly Oil Company, Docket Nos. G-18638, *et al.*

[2] Amerada Petroleum Corporation, *et al.*, Docket Nos. CI62-1544, *et al.*

respect to each quality defect, and the resulting rate for the gas. Such statement shall be signed by both seller and buyer. However, if the seller and buyer are unable to agree upon any or all of the particulars entering into the computation of the proper price, the seller must so indicate in the statement and supply the information required to compute the applicable area rate as adjusted as well as the contentions of the parties with respect to the quality and amount of the adjustment as any item in dispute. The buyer may file a separate statement setting forth its views within such period. In such event the Commission will then determine the amount of the quality deduction. As in the case of *North Central Oil Corporation (Operator) et al., supra,* the determination of any refunds which may be due for the period of the temporary, when no express refund conditions were in effect, shall be deferred.

The applications of *Socony Mobil Oil Company, Inc.,* (Socony), Docket No. CI61-34, and *Texaco Inc.,* Docket No. CI61-879, involve so-called Spraberry or El Paso contracts. In accordance with the principles established in Opinion No. 468, the applicable area rate will be applied to the volumes of residue gas taken into the purchaser's pipeline under these contracts. The contracts provide that there shall be a reduction in the price paid for such residue gas if treatment of the casinghead stream received by the buyer is necessary to remove sulphur. The cost of such treatment and the cost of any other necessary treatment of the casinghead stream to bring the gas to pipeline quality, aside from those processing costs incurred in removing the liquids, must be deducted

from the ceiling price of 14.5 cents per Mcf to determine the applicable area rate. The certificates granted in these two dockets will be conditioned upon a filing by the producer within 90 days of the effective date of this order of a statement as to quality of the casinghead gas and cost

of treating (or an estimate if no agreement is reached) as described above and further conditioned upon an initial price equal to the applicable rate established by deduction from 14.5 cents per Mcf of the cost of treating the gas to pipeline quality standards as such cost is determined by agreement of the parties or by the Commission. During the time they were operating under these temporary certificates both Socony and Texaco Inc. filed for rate increases which were suspended and are now in effect subject to refund. Computations of the refunds due for the period during which these rates have been collected subject to refund will be dealt with in the Section 4(e) proceedings—Docket Nos. RI65-209 and RI65-115.

Socony succeeded to a temporary certificate which contained a refund condition. Texaco Inc. succeeded to a temporary certificate without refund condition. Accordingly, Socony will be required to submit a computation of all excess amounts collected for the entire period of operations under the temporary certificate except the time during which the Section 4(e) proceeding was pending, and to make refund of those amounts with interest. For the reasons previously stated, Texaco Inc. will not be required at this time to make any refunds for the period when there was no express refund condition.

All certificates issued herein shall be subject to a moratorium against rate increases prior to January 1, 1968, unless such increases are authorized by later order of the Commission.

The Commission finds:

(1) Each applicant for a certificate of public convenience and necessity listed in Appendix A hereto is a natural-gas company within the meaning of the Natural Gas Act as an independent producer of natural gas, as that term is defined in section 154.91(a) of the Commission's Regulations, engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption and such sales together with the construction and operation of any facilities therefor are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(2) Each applicant listed in Appendix A hereto is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(3) The sale of natural gas as proposed herein by each applicant listed in Appendix A hereto together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor are required by the public convenience and necessity and a certificate authorizing the same should issue to each of them upon the terms and conditions of the order herein,

which terms and conditions are required by the public convenience and necessity.

(4) Except as granted in the order in Opinion No. 468 the exceptions of the applicants listed in Appendix A hereto to the presiding examiner's initial decision and proposed order should be denied.

The Commission orders:

(A) Certificates of public convenience and necessity are issued, upon the terms and conditions of this order, authorizing the sales by the applicants listed in Appendix A to this opinion of natural gas in interstate commerce for resale, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary for such sales, all as hereinbefore described and as more fully described in the respective applications, amendments, supplements and exhibits in this proceeding.

(B) The certificates granted in paragraph (A) above are not transferable and shall be effective only so long as the applicants continue the acts or operations hereby authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations and orders of the Commission.

(C) The grant of the certificates issued in paragraph (A) above shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act or Part 154 or Part 157 of the Commission's Regulations thereunder, and

is without prejudice to any findings or orders which have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the respective applicants. Further, our action in this proceeding shall not foreclose or prejudice any future proceedings or objections relating to the operation of any price or related provisions in the gas purchase contracts herein involved. The grant of the certificates aforesaid for service to the particular customers involved shall not imply approval of all the terms of the respective contracts, particularly as to the cessation of service upon termination of said contracts, as provided by Section 7(b) of the Natural Gas Act. The grant of the certificates aforesaid shall not be construed to preclude the imposition of any sanctions pursuant to the provisions of the Natural Gas Act for the unauthorized commencement of any sales of natural gas subject to said certificates.

(D) The notice provisions of Section 154.94(b) and the detailed submittal subprovisions of Section 154.94(f) of the Commission's Regulations Under the Natural Gas Act are waived insofar as they apply to any reductions in rates hereby ordered.

(E) The certificate granted to North Central Oil Corporation (Operator), *et al.*, is conditioned upon a total initial price, including tax reimbursement, of 14.5 cents per Mcf at 14.65 psia, and within 30 days of the effective date of this order North Central shall file a supplement to its presently filed rate schedule reflecting the con-

ditioned price as the initial price in lieu of the initial price provided in the present rate schedule.

(F) The certificates granted to the applicants, other than North Central Oil Corporation (Operator), *et al.*, are hereby conditioned to a total initial price, including tax reimbursement, no greater than the applicable base area rate of 14.5 cents per Mcf at 14.65 psia subject to further reductions, effective as of the effective date of this order, for any quality deviations as determined pursuant to ordering paragraph (G) hereof, and further conditioned upon the filing by the respective applicants within 30 days of the determination of such rate of a supplement to its filed rate schedule reflecting the applicable area rate in lieu of any rate provided in the rate schedule then on file, and further conditioned upon refunds being made with interest by each applicant of the difference between the applicable area rate and any rate in excess thereof collected subsequent to the effective date of this order. The manner and time of such refunds shall be determined by the Commission in a later order.

277,807

(G) The certificate hereby granted to each applicant listed in Appendix A hereto, other than North Central Oil Corporation (Operator) et al., is issued upon the condition that such applicant (unless the sale qualifies as a small producer sale pursuant to the proposed rule issued this date) shall file, within 90 days of the effective date of this order, a statement that the gas accords with all pipeline quality standards established in Opinion No. 468 or in which respects the gas deviates from such standards,

the agreed cost to the buyer of processing the gas to bring it to the quality standards with respect to each quality defect and the resulting rate for the gas. Such statement shall be signed by both seller and buyer. However, if the seller and buyer are unable to agree upon any or all of the particulars entering into the computation of the proper price, the seller must so indicate in the statement and supply the information required to compute the applicable area rate as adjusted as well as the contentions of the parties with respect to the quality and amount of the adjustment as any item in dispute. The buyer may file a separate statement setting forth its views within such period.

(H) The certificate granted to Socony Mobil Oil Company, Inc. is issued upon the condition that the said applicant shall file within 120 days of the effective date of this order a report in triplicate with this Commission of the refunds due each buyer by reason of the collection by said applicant and its predecessor of rates in excess of the applicable area rate during the period in which such excess rates were collected prior to the effective date of the rate which is the subject of the present proceeding in Docket No. RI65-209.

(I) Socony Mobil Oil Company, Inc. shall retain the amounts shown in the report required under (H) above, subject to further order of the Commission directing the disposition of those amounts. If said applicant elects to commingle these retained refunds with its general assets and use them for its corporate purposes, it shall pay

interest thereon at the rate of 7 percent per annum on all funds thus available from the date of the filing of the refund report to the date on which they are paid over to the person ultimately determined to be entitled thereto in a final order of the Commission. If the applicant elects to deposit the retained refunds in a special escrow account, the respondent shall tender for filing on or before the date of the filing of the refund report an executed Escrow Agreement, conditioned as set out below accompanied by certificate showing service of a copy thereof upon each of its jurisdictional customers. Unless notified to the contrary by the Secretary within 30 days from the date of filing thereof, the Escrow Agreement shall be deemed to be satisfactory and to have been accepted for filing. The Escrow Agreement shall be entered into between respondent and any bank or trust company used as a depositor for funds of the United States Government and the agreement shall be conditioned as follows:

(1) Respondent, the bank or trust company, and the successors and assigns of each, shall be held and formally bound unto the Federal Power Commission for the use and benefit of those entitled thereto, with respect to all amounts and the interest thereon deposited in a special escrow account, subject to such Agreement, and such bank or trust company shall be bound to pay over to such person or persons as may be identified and designated by final order of the Commission and in such manner as may be therein specified, all of any portion of such deposits and the interest thereon.

(2) The bank or trust company may invest and re-invest such deposits in any short-term indebtedness of the United States or an agency thereof or in any form of obligation guaranteed by the United States which is, respectively, payable within 120 days as the said bank or trust company in the exercise of its sound discretion may select.

(3) Such bank or trust company shall be liable only for such interest as the invested funds described in Paragraph (2) above will earn and no other interest may be collected from it.

(4) Such bank or trust company shall be entitled to such compensation as is fair, reasonable and customary for its services as such, which compensation shall be paid out of the escrow account to such bank or trust company. Said bank or trust company shall likewise be entitled to reimbursement for its reasonable expenses necessarily incurred in the administration of this escrow account, which reimbursement shall be made out of the escrow account.

(5) Such bank or trust company shall report to the Secretary of this Commission quarterly, certifying the amount deposited in the trust account for the quarterly period.

(J) The decision whether refunds should be ordered as a condition of the permanent certificate of applicants, other than Socony Mobil Oil Company, Inc., listed in Appendix A hereto is deferred for subsequent determination. Such certificates shall issue at the present time subject to the condition that the subsequent determination of the Commission with respect to such refunds shall then be incorporated in each such certificate as a condition thereof.

(K) The certificate granted to each applicant listed in Appendix A hereto is issued upon the condition that the applicant shall not file any change in rate providing for

a price in excess of the applicable area rate prior to (1) subsequent order of the Commission in this proceeding permitting such filing or (2) January 1, 1968, whichever is earlier.

(L) The certificate of each applicant listed in Appendix A is issued upon the condition that the proposed rate schedule of the applicant shall be amended by the inclusion of the following language:

> "From the effective date of the order of the Federal Power Commission in the Permian Basin Area Rate Proceeding AR61-1, until January 1, 1968, no increase in rates may be filed, except in compliance with a specific order of the Commission, at a rate in excess of the applicable area rate as determined pursuant to said proceeding or pursuant to later order of the Commission. Applicable area rate, as that term is used herein, shall mean the rate to be determined after all adjustments from the ceiling price because of deviations from the pipeline quality standards established in the aforesaid order of the Commission."

(M) Except as herein granted the exceptions to the initial decision and proposed order are hereby denied.

By the Commission.

OPINION NO. 468-A

DENYING APPLICATIONS FOR REHEARING OF OPINION NO. 468

(Issued October 4, 1965)

SWIDLER, Chairman:

On August 5, 1965, the Commission issued its Opinion No. 468 in the above-entitled proceeding. Applications for rehearing have been filed by various parties. The applications in part consist of a repetition of contentions which were fully considered in the course of reaching the determinations embodied in Opinion No. 468. However, the applications have persuaded us that certain modifications are required in the quality standards prescribed in Opinion No. 468. In addition we wish to clarify certain findings in the opinion with respect to which questions have been raised and to respond to certain contentions not previously advanced.

(278,704)

Initially we note and reject the contention by the respondent Phillips Petroleum Company and by Independent Petroleum Association of America that the participation of Commissioner Black and the Chairman in the Opinion and Order herein was improper because they had demonstrated bias and prejudgment on the issue whether competition among producers can be relied upon to justify their contract prices as just and reasonable under the standards of the Natural Gas Act. Nothing which has transpired since the release of Opinion No. 447, in which we rejected an earlier motion to disqualify Commissioner Black, leads us to doubt the correctness of our

278,705

conclusion there. The views expressed therein are equally applicable to the attempt, belatedly and retroactively, to disqualify the Chairman on the basis of his speech of September 22, 1964, to the Independent Natural Gas Association of America of which we take notice.[1]

[1] Speaking personally, I am unaware of any bias or prejudgment on the issue of competition or any other issue in this proceeding. It would have been impossible for me to have worked four years as a member and Chairman of the Commission without acquiring some knowledge of the economic forces which affect natural gas pricing and forming opinions on how they operate. I have formed and expressed some opinions on the questions raised by proposed legislation to repeal FPC regulation over sales by gas producers in interstate commerce. My speech to INGAA expressed my belief that the Natural Gas Act as interpreted by the Supreme Court to apply to gas producers is necessary to protect the interests of the consuming public and made clear that on this legislative question I had not been persuaded by the arguments that competition between producers was an adequate substitute for regulation. These views on the need for producer regulation, however, did not prevent me from fairly evaluating the evidence in this proceeding bearing on the weight to be given to competition in determining the standards for fixing just and reasonable area rates. — JCS

Quality Standards

We shall now discuss three changes and clarifications which we are making in the quality standards:

Pressure

Several producer-applicants argue that the standard of 800 pounds pressure for pipeline quality gas is not realistic, pointing out that most of the gas delivered in the Permian Basin in 1960 was delivered below that pressure. We agree. While the record supports our conclusion that 800 pounds is the pressure generally employed in the principal mainline segment of the pipelines in the Permian Basin, our conclusion did not give sufficient weight to the pipeline systems operated in the Permian Basin at much lower pressure and to the

actual delivery standards in the area. Upon further consideration we believe that a pressure standard of 500 pounds would more nearly reflect the pressure at which gas is delivered to the pipeline systems in the Permian Basin.

Shell Oil Company (Shell) posed the problem of the unfairness of a quality deduction for sales of gas which the producer is ready and able to deliver at pressures higher than those at which the buyer can accept gas. We think that this point is also well taken. The delivery pressure for purposes of quality adjustments shall be the pressure at which the seller is ready and able to deliver gas into the buyers' facilities without further compression, even if such pressure must be reduced so that it can

be conveniently accepted by the buyers' established facilities at the point of delivery. Our previous order will be modified in this respect.

Btu Adjustment for Flowing Gas

In Opinion No. 468 we specified a Btu adjustment for new gas-well but did not do so for flowing gas. Upon reconsideration we are persuaded by the producers' argument that there is no adequate justification for this difference in treatment, and we agree that the price for both new gas-well gas and flowing gas should be related to its energy content. The producers correctly point out that otherwise the quality adjustments on flowing gas would operate in only one direction. There would be no upward adjustment for gas rich in energy, but which would nevertheless be subject to a downward adjustment because of excessive sulphur or low pressure. We believe the reasons stated for applying the Btu content standard to new gas-well gas apply equally to flowing gas and our previous order will be modified accordingly.

The Btu adjustment will be applied to the area base rate before price adjustments for quality. In view of the fact that a majority of contracts for gas-well gas provide for a payment for liquids removed by the purchaser, Btu content should be measured after the removal of such liquids where such payment is made.[2] To measure Btu's prior to extraction of the liquids and then pay a bonus for high Btu content in the form of liquids would be a double payment.

[2] The same principle would also apply in the case of similar contracts for residue or casinghead gas.

278,707

Carbon Dioxide Adjustments

Under Opinion No. 468 a producer with gas containing excessive amounts of carbon dioxide is paid on the basis of the volume of gas remaining after deduction of the above standard volumes of carbon dioxide. The application of the Btu adjustment provision to flowing gas makes possible a somewhat simpler handling of rates in contracts containing a high percentage of carbon dioxide. In addition to the method described above, we can now provide the producers with the alternative of pricing their gas on the basis of the volume actually delivered to the pipeline which still contains the carbon dioxide provided that the Btu content of the gas is also measured at that time. In these circumstances gas consumers will not be paying for carbon dioxide because the Btu content will be considerably below the minimum 1,000 Btu content established as an area standard in this proceeding and the price will be reduced accordingly.

Under either alternative the pipelines' cost of processing actually incurred to remove the carbon dioxide should be deducted from the area base rate to determine the applicable ceiling price. If the producer prefers to price his gas on the basis of the volume remaining after the carbon dioxide is removed, the Btu content for purposes of the adjustment provided herein shall be measured on the basis of the volume of gas after such removal and the total amount to be paid for gas should also be computed on the volume of gas remaining after the carbon dioxide has been removed.

(278,707)

Recovery of Processing Costs by the Pipelines

In setting forth the procedures in Opinion No. 468 for determining the amount of the reductions from the base price to reflect processing costs to bring the gas up to our quality standards, we provided that we would accept agreements between the producer and the pipeline as to the extent of the processing costs involved. It has been suggested that the likelihood of reaching agreement in most cases has been impaired by an indication in the opinion that if a pipeline agreed with producers upon the amounts of processing costs it could not thereafter claim more as part of its cost of service. We did not intend such an arbitrary rule. We

278,708

recognize, of course, that no negotiated cost can be expected to be absolutely accurate, that costs may vary over the years, that legitimate processing costs may be incurred to bring the gas up to a quality standard higher than we are prescribing for rate adjustment purposes, that some processing facilities must incorporate reserve capacity for use in pipeline operations, and that there are other legitimate processing costs that may be in incurred by a pipeline not accounted for in the negotiated price.

We emphasize our desire to encourage agreement between the parties as to the proper amounts to be paid or deducted for quality adjustments. While we do not intend to permit the agreements between producers and pipelines to be used for the purpose of establishing arti-

ficially low processing costs, with the pipeline and ultimately the consumer making up the difference, we will approve all such agreements which reflect a good faith effort to approximate the processing costs involved, and accept for the pipelines' rate purposes the adjustments computed thereunder. In reaching such agreements the parties may utilize average processing costs where cost data for individual contracts are not readily available. No pipeline need fear that any such agreement will prejudice its claims to its legitimate costs not covered by the agreement.

New Gas-Well Gas From Committed Acreage

The producers contend that frequently there may prove to be extensive gas deposits at horizons below those already tapped by oil or gas wells. They strongly argue that the development of acreage now committed under old gas contracts may be inhibited if future discoveries of gas-well gas from such acreage do not command the higher ceiling for new gas-well gas. We believe this point deserves further consideration.

There is merit to the contention that the basis for classifying additional discoveries of gas-well gas from deeper reservoirs should not depend solely on whether there has been prior dedication but rather on whether such classification will encourage the directional search for gas. The issue is thus whether the new gas-well gas ceiling is needed in the public interest for gas from committed acreage. One factor to be considered is that lease acquisition costs have already been incurred in connec-

tion with committed acreage. Another relevant question is how much information as to the existence of gas at lower levels is provided by wells that have already been drilled.

278,709

On a full record, the producers may well be able to demonstrate that gas discovered in new reservoirs separate from existing reservoirs and at lower depths should command the new gas ceiling irrespective of prior dedications. On this record, however, the issue was not developed by the parties sufficiently to serve as a basis for departing from our past policy of applying the new gas price only to gas that has not yet been committed to the interstate market.

We believe the issue should be fully developed in the *Hugoton-Anadarko* case, AR64-1, and any change in policy will be applied prospectively to the Permian Basin.

Revenues v. Costs

A major argument presented in the several producer applications for rehearing is that, because of the quality adjustments (presumably even as we are modifying them herein), the Commission has not fixed area rates at a level high enough to produce overall revenues which would in the aggregate match producer "costs." The argument fails to take account of the fact that the cost of gas-well gas that served as a yardstick for establishing the area rate includes a twelve percent rate of return (amounting to about 5 cents per Mcf) which the Commission expressly indicated was set at this figure in part

(and in the case of flowing gas, where the problem of low-quality gas is more pronounced, in large part) in order to compensate for the risk of finding gas of less than pipeline quality.

The producer's "revenue deficiency" argument is also in error in assuming that the flowing gas costs 14.5 cents per Mcf, or that the Commission so found. The Commission used the cost of flowing gas-well gas as the basic yardstick for fixing the price of all flowing gas (for the reasons stated in Opinion No. 468, pp. 70-77). While the cost of residue gas cannot be found with the precision requisite to serve as a basis for fixing ceiling prices, the evidence in the record makes clear that with respect to casinghead gas and residue gas derived therefrom (which together make up by far the largest share of the Permian gas subject to quality adjustments)

the costs are substantially below the 14.5 cents per Mcf ceiling price. For one thing the price includes a 4.08 cents allowance for exploration and development expense even though such gas was largely found as a by-product of the search for oil. For another, there would be no reason to allow producers a 12 percent rate of return on their investment for processing residue gas since the investment in processing plants and equipment is subject to few of the special risks incurred by those who explore for and develop reserves of gas.

We do not mean to suggest that the E&D allowance and the profit which we have provided for flowing gas is not fully justified, but we believe it is relevant to point

out that these two items, which account for 9.0 cents of the 14.5 cents price for flowing gas, are based in part on justifications other than cost, and provide ample allowance for the risk that low-quality gas in the area may not command the full area price.

It is relevant also in any comparison of revenues and costs in the Permian Basin to consider the additional producer revenues under the *Spraberry* contracts which govern the sale of approximately 20 percent of the gas sold in the Permian Basin. Under these contracts the producers will receive, in addition to the ceiling price for residue gas, substantial payments for the liquids which the pipelines extract from the unprocessed gas. The record does not reveal the precise amount of such revenues but the contracts and billing statements on file with the Commission confirm that they are substantial.

The producers' comparison of revenues and costs also fails to reflect a substantial amount of revenue which we did not take into account in any way in computing the cost of old gas-well gas, and which we may have underestimated in determining the new gas-well gas price. We refer to the payments received by the sellers of gas-well gas for liquid hydrocarbons extracted from the gas by the pipelines. El Paso points out in its application for clarification that these liquid credits approximate on the average 0.6 cents to 0.8 cents per Mcf in the Permian Basin. This may be contrasted with the plant liquid credit of 0.2 cents based on nationwide statistics used in computing the cost of new gas-well gas and the absence of any such credit against costs in the flowing gas computation.

The precise amount of the plant liquid credit which El Paso states it pays to the producers is not verified by evidence in the record although the contracts for the sale of gas-well gas in the area reveal that such payments are generally made. In these circumstances we do not believe it appropriate to adjust the cost to reflect this undetermined amount of additional producer revenue. However, it is clear that this revenue, which is separate and apart from payments for excess Btu's in the gas after removal of liquids, tends to offset any reduction in aggregate revenues due to downward quality adjustments.

The application by the Major Producers refers to "the Commission's finding that jurisdictional revenues will equate to jurisdictional costs." The Commission made no such finding. Obviously the Commission cannot allow higher rates to offset "revenue deficiencies" resulting from producer contract prices below the area ceiling. The Major Producers' own petition states that the "revenue deficiencies" resulting from these contractural limitations amounts to 0.76 cents per Mcf. It would be contrary to all regulatory principles to permit prices in excess of an otherwise just and reasonable rate for certain purchases merely because other sales had been voluntarily made at below full cost as herein determined.

It is argued that because it is impossible to quantify exactly the extent of quality discounts there can be no basis for determining the validity of the Commission's rate of return determination either as a whole or to the

NCR

MICROCARD EDITIONS, INC.

CARD 15

extent that it purports to reflect the risk of quality deficiency. The record does not leave us as much in the dark in this matter as the producers would have us believe. As Commissioner O'Connor stated in his concurring opinion, the record indicates that for gas-well gas under Opinion No. 468 "the reasonable amount of the average adjustment will be in a range of from 1.0 cents to 1.7 cents." With the changes we have here made with respect to quality standards, the average adjustments for gas-well gas will range from 0.7 cents to 1.5 cents, reduced by the additional revenue for plant liquids and the effect of the Btu adjustment.

278,712

As to the flowing gas, the additional upward adjustment for gas with a Btu content of more than 1,050 Btu, coupled with the change in pressure standards substantially reduces the amount of downward adjustments. We have already noted the offsetting revenues to the producers from liquid credits and the fact that the cost of residue and casinghead (the bulk of the gas in the area) is substantially lower than the 14.5 cents price.

While it is true that neither the amount of the downward quality adjustments or the offsetting sources of additional revenue can be determined precisely, we are convinced that the record fully justifies the Commission's judgment that the ceiling prices we have fixed "provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur" in the Permian Basin.

Flowing Residue Gas-Cost and Price

It has been stated in the applications of several producer-respondents that the price of residue gas derived from casinghead gas should be fixed at a higher price because the record contains evidence which would establish this cost at a level above the 14.5 cents per Mcf based on gas-well gas costs. The record does not support this argument. On the contrary, while a precise cost computation of residue gas cannot be made with sufficient assurance of accuracy to serve as a basis for fixing prices the evidence demonstrates that the cost of residue gas is lower than the cost of flowing gas-well gas. The defects in the evidence which the producers cite were pointed out by the examiner. (Initial Decision, pages 103-107.) The staff in its exceptions agreed with the examiner's downward adjustment of its figures. Without passing on the merits of the evidence it certainly does not support a higher price for residue gas.

The Differing Base Rates in Texas and New Mexico

Some of the applicants appear to have misunderstood the nature of our determination in fixing base rates for Texas production inclusive of production taxes, while fixing base rates for New Mexico to which present New Mexico taxes may be added. At the present time taxes in New Mexico are not

uniform, and different sales of natural gas within that state may be subject to quite different taxes. In the State of Texas, on the other hand, a production tax of 7 percent

applies uniformly to all sales. It is possible, therefore, to compute base rates including taxes which would be applicable to all Permian Basin production within the State of Texas. Since this is not possible with respect to New Mexico production, a different formula is used. The net result, however, is precisely the same for the two states — in each case the present taxes are included in computing the total prices which may be charged. This is not a determination that any and all taxes which the State of New Mexico may choose to impose in the future may be added to New Mexico base prices.

In its petition for rehearing El Paso requests the Commission to clarify whether in computing the applicable state and local production taxes for New Mexico there should be included the New Mexico Oil and Gas Ad Valorem Production Tax. The records of this proceeding show that such a tax is a property tax, not a production tax, and as such was included in our computation of the cost of finding and producing gas. Accordingly such tax shall not be included in computing the applicable New Mexico production taxes.

Refund Below the Last Clean Rate

First raised by Skelly, and repeated in other applications, is the contention that "the Commission's refund order exceeds its refund authority under Section 4(e) which is limited to the increased increment in the rate between the time the suspended increased rate is made effective and the date of the Commission's final order in the suspension proceeding." With this contention we

need not deal at this time, since no such situation has been presented as resulting from our order herein. It will be time enough to deal with this issue when and if it is established that any refunds below the last clean rate are required.

Classification of Gas on Basis of Contract Date

It has also been contended that contracts should not be classified as contracts for new or old gas by reason of the date of the contract, but rather on the basis of the date the gas was first committed to interstate commerce, assuming commitment occurred at a later date. We have chosen the

date set forth in the contract because that date is precise, definite and certain, whereas the date of commitment of gas to interstate commerce is less easy of ascertainment. We therefore do not believe any change in our decision on this issue is warranted.

Refunds — Pipeline Verification

We agree with El Paso that a condition should be attached to the refund requirement that it should be required that the purchaser verify the refund calculations, and the order accompanying this opinion will so provide.

Method of Rate Determination

Some confusion apparently exists with respect to the method of determining the proper price under a given contract. If a producer has a contract calling for a stated

price with specified increases for additional Btu content or specified deductions for certain quality deficiencies, the contract price is to be computed as though no price regulation existed. As a second step it will be necessary to compute the applicable area rate for the gas sold under the contract, without regard to the contract price provisions. The area rate will be the applicable base rate plus or minus the quality adjustments allowed or required by our decision and order. The proper rate to be charged and collected under the contract will be the contract price if it does not exceed the applicable area rate. If it exceeds the applicable area rate the latter will apply.[3]

278,715

Rates Involved in Application of Order to Unconsolidated Section 4(e) Proceedings

In the Addendum to its Supplemental Application for Rehearing Shell inquiries whether ordering paragraph (E) of Opinion No. 468 applies to pending Section 4(e) proceedings not consolidated herein but which are subject to the Order to Show Cause issued in conjunction with Opinion No. 468. Paragraph (E) as previously

[3] For example, if a contract for new gas-well gas provides for a price of 16.0 cents with a proportionate upward Btu adjustment for Btu's in excess of 1,000 per Mcf, and the gas contains 1,030 Btu's per Mcf, the contract price would be 16.48 cents, assuming there are no other adjustments called for under the contract. The applicable area rate in Texas would be 16.5 cents per Mcf — the area base price with no upward or downward Btu adjustment, since 1,030 Btu's is in the range between 1,000 and 1,050. The proper rate chargeable under the contract would be 16.48 cents. If the same contract were for old gas-well gas produced in Texas the proper rate would be 14.5 cents since the applicable area rate would be lower than the contract rate.

modified requires that a supplement be filed by November 15, 1965, to each filed rate schedule in excess of the area base rate reflecting reductions to conform the filed rate to the area base rate. Pursuant to section 5(a) of the Act we have ordered all rate schedules of respondents which are in excess of area base rates to be reduced in conformity with paragraph (E). The fact that a respondent's rate schedule may be subject to an unconsolidated section 4(e) proceeding for a past period does not relieve respondent of filing a supplement in conformity with paragraph (E). The only remaining function of the unconsolidated section 4(e) proceeding is with respect to refunds for past periods to which the section 5(a) proceedings do not apply.

Requests for Stay of Order

A number of the producers have requested a stay of all or some of the ordering paragraphs of Opinion No. 468, until after completion of contemplated judicial review proceedings. Section 19(c) of the Natural Gas Act makes it clear a stay is not warranted for the sole reason that judicial review is to be sought. At a minimum, parties seeking a stay should demonstrate that any injuries they suffer, absent a stay, would be irreparable and would outweigh the irreparable injury to the public from granting the stay. See, *e.g.*, *Virginia Petroleum Jobbers Association* v. *F.P.C.*, 259 F. 2d 921 (CADC); *Associated Securities Corp.* v. *S.E.C.*, 283 F. 2d 773 (CA10); *Tennessee Gas Transmission Co.* v. *F.P.C.*, 283 F. 2d 729 (CA5).

The producers failed to make such a showing. If the order were set aside, the producers would not be precluded from recovering the difference between the rates collected and the rate which the producers should have been permitted to collect.[4] The Commission, in the event of judicial reversal, would have adequate authority, including power to fix future rates, to take any necessary corrective action to protect not only the producers but also the pipeline purchasers.

In any event, even a showing of irreparable injury would normally not be sufficient in itself to warrant a stay of a rate reduction or moratorium order when it is outweighed by the detriment to the public. As the courts have held (*e.g., Virginia Jobbers Association* v. *F.P.C.*, 259 F.2d 921 (CADC)), the effect of a stay on other interested parties and the public interest are of at least equal significance to the impact on private parties of its denial. In this case, grant of stay would mean the continued collection of rates which we have found, after careful consideration, to be excessive. Even if all such amounts were subject to refund requirements, it is well recognized that the protection afforded through the re-

[4] *Hunt Oil Company, et al.*, in their motion for stay, recognize this in their alternative suggestion that some of the ordering paragraphs, including paragraph (H), imposing the rate increase moratorium, be made effective "upon the express condition that to the extent that they are not judicially affirmed, if judicial review is sought thereon, they will be null and void *ab initio* and appropriate redress procedures would be adopted by the Commission to rectify any detriment which the Movants might suffer as a result of compliance with the Ordering Paragraphs which are subsequently reversed or modified."

fund procedure will not give full protection to the ultimate consumers. *F.P.C.* v. *Tennessee Gas Transmission Co.*, 371 U.S. 145, 154-155; *F.P.C.* v. *Hunt*, 376 U.S. 515, 524-525. We need not repeat the discussion set forth in Opinion No. 468 of why the moratorium of rate increases above the ceiling prices is essential. A stay of the moratorium would mean its elimination. As we observed

"Without a moratorium, the conclusion of one area proceeding would only signal the beginning of the next, and just and reasonable rates for consumers would always be one area proceeding away." [Opinion No. 468, p. 108]

Delay in giving effect to the ordered rate reduction in this case will be doubly injurious to the California consumer to whom most of the Permian gas is delivered, because it is our understanding that the Southern California distributing companies which purchase gas from El Paso and Transwestern also purchase substantial quantities of gas from California producers under long-term contracts in which the price is geared to the weighted average California border price for wholesale gas and is adjusted to reflect the border price in effect January 1 of each year. See *Re Pacific Lighting Gas Supply Co.*, 44 PUR 3d 177, 184 (Calif. P.U.C., 1962). Thus, a stay of the ordered rate reductions and the consequent delay in pipeline rate reductions would result in unrecoverable losses to the California distributing companies and presumably their customers. The Court of Appeals for the Fifth Circuit expressly took this factor into account in denying El Paso's request to stay the rate reductions ordered by us

in October 1962. *El Paso Natural Gas Co.* v. *F.P.C.*, CA5, No. 20180, December 21, 1962 (unreported).

Several producers also base their request in part on the assertion that, absent a stay, complex problems relating to royalty payments and state tax payments will have been created. It is not shown that such problems would cause irreparable harm. Moreover, as applicants recognize, any stay that might be issued should be on condition that all rates required to be reduced under Opinion No. 468 be collected subject to refund obligations at least for the period starting September 1, 1965, the effective date of Opinion No. 468. In view of this, it would not appear that an immediate rate reduction, with the opportunity for recoupment of undercharges in the event of judicial modification or reversal of our order, would create more complex problems with respect to royalty and tax payments than would exist with respect to the collection of rates subject to refund, pursuant to either a stay condition or existing requirements.

In these circumstances, the requested stay of the ordered rate reductions and the moratorium on increased rates would be totally unwarranted.

Even though the Opinion No. 468 does not require refunds to be made for rates collected prior to September 1, 1965, until further Commission action is taken, it is appropriate to indicate now that we will not take such further action until at least after the decision by the Court of Appeals which reviews Opinion No. 468. We

recognize that with respect to rates collected subject to refund for as much as 8 years prior to Opinion No. 468, the various inadequacies of the refund procedure as they relate to this case cannot be avoided even by immediate refunds. The prompt effectuation of just and reasonable rates for the future is of primary importance and the deferral of refunds due will provide additional insurance that our order in this respect cannot result in irreparable injury to the producers. Postponement of further Commission action requiring refunds is therefore deemed appropriate.

Other Matters

Certain producers presented contentions which related to their individual circumstances. Without suggesting that these contentions stated adequate grounds for special relief under Opinion No. 468 it is clear that they do not state any basis for modification of our area rate order which is of general application.

Numerous other arguments were advanced by producers in their application for rehearing but they have all been adequately disposed of by the full discussions supporting our findings and order in Opinion No. 468. The applications, therefore, should be denied except insofar as we have modified our order as provided herein.

278,719

The Commission further finds:

(1) The quality standards and adjustments to the base area rates set forth in Opinion No. 468 and accompanying order should be modified as provided in the ordering provisions hereinafter set forth.

(2) The applications for rehearing and accompanying motions set forth no new facts or principles of law which either were not fully considered by the Commission when it adopted Opinion No. 468 and its accompanying order, or which now being considered warrant any change in, vacation or modification of such order, except as set forth herein.

(3) Good cause has not been shown for reopening this proceeding for receipt of additional evidence.

The Commission orders:

(A) Each and every reference in Opinion No. 468 or its accompanying order, or in Opinion No. 468-A or this accompanying order, to Texas Railroad District No. 8 shall be considered to include both the present Texas Railroad Districts 8 and 8-A.

(B) Paragraph (B) of the order issued together with Opinion No. 468 shall be amended to read as follows:

"(B) *Quality Standards and Adjustments to the Base Area Rates*

(1) The base area rates fixed in ordering paragraph (A) herein shall be adjusted for any deviations from the standards for pipeline quality gas in Texas Railroad District Nos. 7-c and 8, and in the New Mexico counties of Lea, Eddy and Chaves, which are hereby established as follows:

a. *Carbon Dioxide:* Pipeline quality gas shall contain not more than 3 percent carbon dioxide by volume.

b. *Hydrogen Sulphide:* Pipeline quality gas shall contain not more than 10 grains of hydrogen sulphide per Mcf of natural gas at 14.73 psia and 60° F.

c. *Total Sulphur:* Pipeline quality gas shall contain not more than 200 grains of total sulphur per Mcf of natural gas at 14.73 psia and 60° F.

d. *H_2O:* Pipeline quality gas shall contain not more than .009 pound of H_2O per Mcf of natural gas at 14.73 psia.

e. *Other Impurities:* Pipeline quality gas shall contain no oxygen, dirt, dust, gum, or other impurity in sufficient amounts to require the buyer to incur processing costs to eliminate such impurities in order for the gas to meet either customary commercial standards or the customary requirements of any of the interstate pipelines in the area.

f. *Pressure:* Pipeline quality gas shall be delivered at a pressure of not less than 500 pounds per square inch gauge.

g. *Btu Adjustment:* The maximum standard will be 1,050 Btu's per cubic foot at 14.73 psia and 60° F. and the minimum standard will be 1,000 Btu's per cubic foot at 14.73 psia and 60° F. Upward and downward adjustments of the base area rates will be on a proportional basis as specified at pages 99-100 of Opinion No. 468 if the Btu content exceeds the maximum standard or is below the minimum standard.

(2) When a purchaser buys gas which deviates from the quality standards established in subparagraph (1) above, the base area rate fixed in ordering paragraph (A) shall be adjusted for any deviations from such standards as follows:

a. The applicable base area rate shall be adjusted downward by the net cost, actually in-

curred prior to ultimate consumption, of processing the gas to bring it up to standard.

278,721

(i) If the processing is performed by the purchaser, a reasonable return upon the net investment should be included as part of the processing cost incurred in bringing the gas up to pipeline quality.

(ii) If such processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

(iii) If the seller is ready and able to deliver natural gas into buyer's facilities without further compression, at pressures higher than the pressure at which the buyers' facilities available at the point of delivery can accept such gas, any downward adjustment for the cost of compression shall be limited to the cost of such compression as is incurred to raise the pressure of the gas from the pressure at which the seller is ready and able to deliver it up to the pressure standard of 500 psig.

b. The applicable base area rate shall be adjusted downward or upward by the amount of any applicable Btu adjustment.

c. In the case of delivery by seller of gas containing carbon dioxide in excess of the standards herein permitted, notwithstanding anything to the contrary in Paragraph (2)(ii) of this order, the producers shall have the alternative of receiving payment for the total volume of gas delivered, including the carbon dioxide,

provided that the Btu content of the gas is measured before removal of the carbon dioxide for the purposes of the Btu adjustments specified in this order, or receiving payment for the volumes exclusive of the carbon dioxide with the Btu content measured by the volumes of gas only."

278,722

(C) Ordering paragraph (F)(1) of the order accompanying Opinion No. 468 is hereby amended by deleting "for new gas-well gas" from line 17 of said ordering paragraph.

(D) Ordering paragraph (I) of the order accompanying Opinion No. 468, designated "Refund Reports", is hereby amended by inserting after the first sentence of said ordering paragraph, the following:

"Within 10 days from the filing of the refund report the buyer shall file its written concurrence or disagreement with such report."

(E) Ordering paragraph (J) of the order accompanying Opinion No. 468 is hereby amended by changing "(E)" to "(I)" in line 2 thereof.

(F) Appendix A, Part III to Opinion No. 468 and its accompanying order is hereby amended as follows:

(a) Page 17, with reference to "Robertson, French, M. & J. P. Bryan (formerly G. Stratton, Jr. (Operator), *et al.*,)" insert a "**" after Docket No. G-16535.

(b) Page 21, delete "Sun Oil Company" and the related Docket No. "RI60-123."

(278,722)

(c) Page 21, delete "Sun Oil Company (Operator), *et al.*" and related Docket No. "RI60-124."

(d) Page 7, with reference to "Aikman, Claude E.", delete Docket No. "G-18466."

(e) Page 21, with reference to "Superior Oil Company, The" delete Docket Nos. "G-18771" and "G-20075."

(G) Appendix D to Opinion No. 468 and its accompanying order is amended to conform to the form of Appendix D to Opinion No. 468-A and this accompanying order.

278,723

(H) The applications for rehearing of Opinion No. 468 and accompanying order, and the motion of Hunt Oil Company, *et al.*, to reopen this proceeding for receipt of additional evidence, are hereby denied.

(I) The motions for stay of Opinion No. 468 and accompanying order, except to the extent granted by the Order Granting Time Extension issued September 28, 1965, in this proceeding, are hereby denied.

By the Commission. Commissioner O'Connor concurring filed a separate statement appended hereto.

O'CONNOR, Commissioner, *concurring:*

Though concurring in the result reached by the majority, I do not rely upon their reasons, and I specifically re-emphasize my position in regards to the 50-Btu gap. It is apparent from the petitions for rehearing of our Opinion No. 468 that a strong possibility exists producers will not be in a position to realize aggregate revenues which reasonably approximate their aggregate costs. Since the specific problem is that of rate design for quality deviations, the impact of which cannot be determined on the record before us, rehearing is properly denied; nevertheless, once the impact is made clear by the quality adjustment determinations, it is entirely likely that rate revisions will be required.

It must be emphasized that, while the specific problem is that of proper quality adjustments, the impact of the overall adjustments can be burdensome to the extent the entire regulatory method is vulnerable. Clearly the impact of a regulatory rate must be considered, *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591, 602 (1944), and, in the event the order does not permit the regulated enterprise an opportunity to recover its costs, then it must fall, *Natural Gas Pipeline Co.* v. *F.P.C.*, 315 U.S. 575, 590 (1942). This rule is applicable as well to group cost

regulation." Cf. *Bowles* v. *Willingham*, 321 U.S. 503, 517-519 (1943). Inherent in the majority opinion is an acknowledgment of this state of the law, and presumably a clear showing of an adverse impact will command revision. It is my position that further revisions will commend themselves to us once the quality impact is clarified.

The record does not permit a meaningful determination of the impact. As discussed in my separate opinion, the probable range will be 1.0 to 1.7 cents. This range is based upon various allegations of a general nature at the hearing and upon the ascertainable costs of processing out the deficiencies. The modified standard for pressure, and the general application of the upward Btu adjustment further alleviates the downward impact. In my opinion the upward adjustment from 1000 Btu's would represent a proper accommodation of costs to quality, and it should be adopted as a proper measure of quality standards. This is all the more compelling in light of the comprehensive study by Shell Oil Company in their Supplemental Petition for Rehearing. According to their figures the maximum

278,726

downward impact could be in a range from 1.86 to 2.27 cents. Adjusted for the revised quality standards adopted today, this range could be 1.6 to 2.0 cents. If the quality impact is of these proportions modification may be required.

I reject the broad generalities relied upon by the majority for rejecting the cost-revenue argument. Their

broad conclusion that producers realize sufficient revenues in any event must be rejected. Federal regulation extends only to natural gas, and producers cannot be compelled to offset a deficit from the commodity with revenues from non-jurisdictional petroleum sales. Cf. *Baltimore & Ohio R.R.* v. *U.S.*, 345 U.S. 143 (1953). It is my position that where the public demands the creation of fettered enclaves of business enterprise, fundamental fairness requires that this same public shoulder the financial requirements of that enterprise. Further contradicting the majority position, it is far from clear that residue costs are less than gas-well costs. At the hearing and in argument before the Examiner, Staff initially took the position that residue costs were probably higher. To bury the quality impact in our rate of return determination is to overlook the basis for the 12 per cent allowance: comparable return on equity of 10-12 per cent by the far less risky operations of transmission companies. Finally, as regards self-imposed revenue deficiencies, many of the lower contracts apparently reflect quality deductions so that revenues realized under those contracts may remain below cost even under the quality standards we have prescribed.

The only proper basis for rejecting the quality impact argument is that the impact cannot be established. The actual conditions of delivery cannot be accurately determined from the record. Furthermore, the quality standards we prescribe may result in less onerous adjustments than the contracts require. We are thus left in the position of being unable to determine the impact. It is my

position that with the elimination of the Btu gap, any present doubts would disappear, and it is probable that no further adjustments would be required.

UNITED STATES OF AMERICA
FEDERAL POWER COMMISSION

Before Commissioners: Joseph C. Swidler, Chairman;
Lawrence J. O'Connor, Jr.;
Charles R. Ross; and
David S. Black

	Docket Nos.
Area Rate Proceeding	AR61-1 *et al.*
North Central Oil Corporation (Operator) *et al.*	CI60-435
Socony Mobil Oil Company, Inc.	CI61-34
Robert T. Brown (Operator) *et al.*	CI61-733
Texaco Inc.	

ORDER DENYING REHEARING AND MODIFYING ORDER WITH RESPECT TO ISSUING CERTIFICATES

(Issued October 4, 1965)

On August 5, 1965, this Commission issued its order in this proceeding granting certificates of public convenience and necessity to four producers upon stated conditions, among which were included price conditions to the applicable area rates as established by Opinion No. 468 and accompanying order issued the same day. Applications for rehearing of Opinion No. 468 and the Order Issuing Certificates were filed by *North Central Oil Corporation, (Operator) et al.*, (North Central) and *Texaco Inc.*, two of the producers to whom certificates

were issued, and the applications of others for rehearing of Opinion No. 468 were also addressed to the Order Issuing Certificates. By Opinion No. 468-A and accompanying order issued this day we have denied the applications for rehearing of Opinion No. 468 and its accompanying order while modifying that opinion and order in certain respects.

North Central, in its application for rehearing states that its original contract was dated in 1960 but that the Supplemental Gas Purchase Agreement which was the subject of the same filing was dated March 9, 1961. It is North Central's contention that the gas dedicated under the supplemental agreement of March 9, 1961, is entitled to the new

gas-well gas price of 16.5 cents per Mcf, since the supplemental agreement was dated after January 1, 1961, the dividing date between old and new gas-well gas. North Central argues that it would be pure formalism to require a new and separate contract instead of a supplemental agreement in order to allow a producer to charge and collect the applicable area rate for new gas-well gas. We agree. Accordingly, our Order Issuing Certificates of August 5, 1965, will be modified to provide that the price condition in the certificate to be issued to North Central allow a price of 16.5 cents per Mcf for natural gas moving under the supplemental agreement of March 9, 1961.

One further matter requires clarification. The applications of *Socony Mobil Oil Company, Inc.*, (Docket

No. CI61-34) and *Texaco Inc.* (Docket No. CI61-879) involve Spraberry contracts discussed in detail in Opinion No. 468. Consistent with that discussion and the arguments advanced in the applications for rehearing we believe the applicable area rate should be applied to the residue volumes, with no deductions therefrom if the residue volumes meet the pipeline quality standards set forth in Opinion No. 468, as modified by Opinion No. 468-A. The consumers will thus pay no more for gas under the Spraberry contracts than any other gas of similar quality. As we indicated in Opinion No. 468, if the pipelines' processing costs exceed the liquid revenues the pipeline can petition for relief in the form of "an appropriate reduction in the price the pipeline pays for such residue gas." Our previous discussion in the Order Issuing Certificates herein is so modified. Any deductions required by contract must, of course, be utilized in determining the contract rate.

The applications for rehearing of the Order Issuing Certificates set forth no other facts or arguments which differ from those which were advanced and fully considered prior to our determinations of the issues in Opinion No. 468 and accompanying order and our determinations of the issues in the original Order Issuing Certificates. Accordingly, the applications for rehearing will be modified as previously stated.

278,729

The Commission finds:

(1) The natural gas to be sold by *North Central Oil Corporation, (Operator) et al.*, under the Supplemental

Gas Purchase Agreement of March 9, 1961, is new gas-well gas as defined in Opinion No. 468 issued August 5, 1965.

(2) Except as stated herein, the arguments and assignments of error presented by the applications for rehearing warrant no change or modification in the Order Issuing Certificates issued August 5, 1965.

The Commission orders:

(A) Paragraph E of the prior Order Issuing Certificates issued August 5, 1965, is amended to read as follows: "The certificate granted to *North Central Oil Corporation (Operator) et al.*, is conditioned upon a total initial price including tax reimbursement of 14.5 cents per Mcf at 14.65 psia for all gas other than that sold pursuant to the Supplemental Gas Purchase Agreement dated March 9, 1961, and upon a total initial price including tax reimbursement of 16.5 cents per Mcf at 14.65 psia for all gas sold pursuant to the Supplemental Gas Purchase Agreement. On or before November 1, 1965, *North Central Oil Corporation, (Operator) et al.*, shall file a supplement or supplements to its presently filed rate schedule reflecting the conditioned prices as the initial prices in lieu of the initial price provided in the rate schedule.

(B) The applications for rehearing of the Order Issuing Certificates of August 5, 1965, are hereby denied.

By the Commission.

Before LEWIS, BREITENSTEIN and HILL, *Circuit Judges.*

BREITENSTEIN, Circuit Judge.

The first area rate decision of the Federal Power Commission is before us for review. It relates to prices for jurisdictional sales of natural gas produced in the Permian Basin, a famous petroleum area where oil and gas are found in hundreds of reservoirs and thousands of wells. The states of Texas and New Mexico, the nation's oil and gas industry, and several related associations attack the decision. The State of California, the cities of San Francisco, Los Angeles, and San Diego, various local distributors, and an organization of such distributors supported. The rejection of the individual company cost-of-service approach to the regulation of independent producers and the adoption of the area rate method raise many novel issues which have been extensively and ably argued. We hold that neither the United States Constitution nor the Natural Gas Act bars the regulation of natural-gas prices on an area basis; that the Commission did not abuse its discretion in adopting the area method; and that the cases must be remanded because the actions of the Commission do not comply with the end result test established in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602-603, and other decisions.

The petitions for review, all brought under § 19(b) of the Natural Gas Act,[1] attack Opinions Nos. 468 and 468-A of the Commission fixing just and reasonable rates

---

[1] 15 U.S.C. §§ 717-717w.

under §§ 4 and 5 of the Act for natural gas produced in the Permian Basin and sold to interstate pipeline companies.

1. *Background.*

The Permian Basin, as defined by the Commission, includes Texas Railroad Commission Districts Nos. 7-C, 8, and 8-A and the New Mexico counties of Chaves, Eddy, and Lea. Nationally, it accounts for about 11% of all the gas sold in interstate commerce. The Commission joined 336 producers as respondents in the consolidated proceedings. Sales by them are made to three interstate pipelines, none of which appear here.[2] About 85% of the Permian gas moving interstate goes to California.

Nearly two-thirds of the Permian gas production comes from oil-well gas, that is, gas produced in conjunction with oil. Because of impurities much of the gas must be processed before introduction to an interstate pipeline. Until El Paso began its purchases, Permian oil-well gas was generally vented or flared because of the lack of a market.

The natural-gas industry has three main parts, the producers, the interstate pipelines, and the distributors. The last are under state or local regulation exclusively. The Commission began federal regulation of the interstate pipelines after the passage of the Natural Gas Act

---

[2] El Paso Natural Gas Company began buying Permian gas in 1945, Northern Natural Gas Company through a predecessor in 1954, and Transwestern Pipeline Company in 1958. In 1961, El Paso purchased 73% of the Permian gas moving in interstate commerce, Northern 18%, and Transwestern 9%.

of 1938. It did not attempt to regulate independent producers[3] until the 1954 decision of the Supreme Court in Phillips Petroleum Co. v. Wisconsin, 347 U.S. 672, (First Phillips) which held that the Act applied to them.

Section 7 of the Act forbids the sale of natural gas subject to Commission jurisdiction without a certificate of public convenience and necessity granted after notice and hearing. Temporary certificates, issued without notice and hearing, are authorized. Our recent decision in Sunray DX Oil Company v. Federal Power Commission, 10 Cir., ... F.2d ....., discusses § 7 procedures and problems. These are not present here because the § 7 applications considered in the consolidated proceedings before the Commission were disposed of in a separate order.

Section 4 requires that all rates shall be just, reasonable, and nondiscriminatory. No change shall be made in a rate without 30 days' notice. When a schedule containing a changed rate is filed, the Commission on its own initiative or on complaint may suspend the rate and set the matter for hearing. The suspension may be for not longer than five months. If no decision is reached within that period, the increased rate becomes effective but the Commission may require a bond conditioned upon the refund of that portion of the increased rate found not to be justified. The instant proceedings involve a number of increased rate filings which were suspended under

---

[3] The word "independent" is used to describe a producer which does not transmit gas interstate either by its own operations or those of an affiliate. Some of the interstate pipelines produce a share of their own gas and sell gas to other pipelines.

§ 4 and which were disposed of by Opinions Nos. 468 and 468-A.

Section 5 provides that whenever the Commission, after hearing had on its own motion or on complaint, finds that a rate is "unjust, unreasonable, unduly discriminatory, or preferential" it shall determine "the just and reasonable rate." In the proceedings at bar the Commission pursuant to § 5 established "the future rates for jurisdictional sales of gas by producers in the area."

After the First Phillips decision the Commission received thousands of certificate applications from producers. The situation was complicated by the need of pipelines for a committed source of supply sufficient to justify financing. To obtain such supply long-term contracts, commonly for 20 years, were made with the producers. They in turn, because they could not file unilaterally for an increased rate contrary to contract and because they desired protection against the unforeseeable economic conditions of the future, insisted on escalation clauses of various types.[4] A general price rise occurred. As the escalation provisions became operative the producers filed under § 4 for increased rates and the Commission suspended many of them. Section 7 applications were under contracts calling for rates comparable to those which the Commission had suspended. This trend was ended by the 1959 decision in Atlantic Refining Co. v. Public Service Commission of New York, 360 U.S. 378, (CATCO) which directed the Commission in certificate cases to keep initial prices in line.

---

[4] See Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F.2d 241, 243.

After the remand in First Phillips, the Commission proceeded with the consideration of just and reasonable rates required by §§ 4 and 5 on the individual company cost-of-service basis which it had long applied in the regulation of electric power companies and interstate pipelines. The first case to reach the decisional stage was that relating to Phillips. On September 28, 1960, the Commission entered Opinion No. 338[5] in which it held that the regulation of independent producers under the Act could be accomplished more appropriately by the establishment of area rates than by the establishment of producer rates on individual cost-of-service findings. Contemporaneously with this Phillips decision, the Commission promulgated its Statement of General Policy No. 61-1[6] which established 23 rate areas and, with unimportant exceptions, announced maximum rates for each area. Two price standards were set, one for initial prices in new contracts and one for escalated prices in existing contracts. For the Permian Basin area the prices were 16 cents and 11 cents respectively.

Opinion No. 338 was affirmed by the Court of Appeals for the District of Columbia Circuit[7] and by the Supreme Court in Wisconsin v. Federal Power Commission, 373 U.S. 294, 310, (Second Phillips) wherein the Court observed that it shared "the Commission's hopes that the area approach may prove to be the ultimate solution" to the problem of regulating the independent producers.

---

[5] 24 FPC 537.

[6] 24 FPC 818.

[7] Wisconsin v. Federal Power Commission, D.C. Cir., 303 F.2d 380.

The first area rate proceeding was that for the Permian Basin and was initiated on December 23, 1960.[8] It was followed by a similar proceeding for the South Louisiana area,[9] for the Hugoton-Anadarko area,[10] and for the Texas Gulf Coast area.[11] The last three are in the hearing stage. The Permian Basin proceeding was decided by Opinions Nos. 468 and 468-A to which we turn.

2. *The Decision of the Commission.*

The 131-page original opinion, No. 468, followed by the 23-page opinion denying rehearing, No. 468-A, need only be summarized at this point. The Commission found the area rate principle free from constitutional and statutory objections and adopted it. Contract prices were rejected as a basis for regulation and the reserves to production ratio was declared to be an inappropriate regulatory standard. The Commission set up a two-price system. It differentiated between gas produced as the sole product of a well, referred to as gas-well gas, and gas produced in association with oil, known as oil-well gas or casinghead gas. One price was established for new gas-well gas and the residue therefrom sold under contracts made on or after January 1, 1961. A second price was established for flowing gas which was defined to include gas-well gas sold under contracts executed before the mentioned date, casinghead gas, and residue gas derived from either source. The January 1, 1961, date of division between new gas-well gas and old gas-well gas was

[8] Docket No. AR61-1, 24 FPC 1121.
[9] Docket No. AR61-2, 25 FPC 942.
[10] Docket No. AR64-1, 30 FPC 1354.
[11] Docket No. AR64-2, 30 FPC 1354.

adopted because that was the approximate date when the industry became able to direct its exploration efforts toward finding gas-well gas as distinguished from finding gas as a by-product in the search for oil. For new gas-well gas the Commission fixed a rate of 16.5 cents per Mcf for the Texas Railroad Districts inclusive of state and local taxes and a rate of 15.5 cents per Mcf for the New Mexico counties exclusive of applicable state and local production taxes. For flowing gas the respective rates were 14.5 cents and 13.5 cents.

In determining these rates the Commission gave consideration to composite costs but treated the two categories of new gas-well gas and flowing gas differently. It said that the price of the former "was geared to the cost of finding and producing future gas supplies and as such was built up primarily from nationally published statistics and the questionnaire data." For flowing gas it said "our touchstone is the historical cost of gas being produced in the Permian Basin area."

The Commission required adjustment on an individual company basis from the stated prices to reflect differentials from the quality standards. These downward adjustments are determined "by the net cost of processing the gas to bring it up to standard." A downward adjustment is also required if the Btu content is less than 1,000 per Mcf and an upward adjustment is permitted if that content is above 1,050.

Small producers, defined as those making less than 10 million Mcf of jurisdictional sales annually, are exempt from the quality adjustments and from certain filing requirements.

The Commission set a minimum price of 9.0 cents per Mcf. Provision is made for special exemption from area rates. Refunds of excess collections are required on an individual company basis. The possibility of changes in area rates is recognized. A moratorium, until January 1, 1968, is declared on rate increases and indefinite escalation clauses are prohibited.

Three commissioners filed separate opinions. With one exception Commissioner O'Connor approved the results reached but said that "the contract price at which most producers are able and willing to operate is just and reasonable" and that "composite costs best serve as a check on average field prices to preclude significant price departures." He disapproved the Btu adjustment saying that an upward adjustment should be applied for all gas having a Btu content in excess of 1,000. Commissioner Ross was critical of accounting methods used and pointed out the need for simplification. He dissented from the division date between new and old gas-well gas. In his view the new gas-well gas price should apply to gas sold after the date of the Commission decision. Commissioner Black said that the allowed 12% rate of return on net investment "is very probably a generous one" but was justified by the special risk of finding substandard gas in the Permian Basin.

3. *Disqualification of Two Commissioners.*

The Continental Group of petitioners urges that Commissioner Black was disqualified to participate in the decision. The Independent Petroleum Association of America, (IPAA) complains of the participation of both

Commissioners Swidler and Black. The claim is that each of them had prejudged the issue of whether substantial competition existed among producers. Additionally, Commissioner Black is accused of personal bias against the producers. The charges stem from public addresses made in 1964.[12] No claim is made that either commissioner prejudged the ultimate issue of a just and reasonable rate. In our opinion no basis for disqualification arises from the fact or assumption that a member of an administrative agency enters a proceeding with advance views on important economic matters in issue. Nothing in the record disturbs the assumption that the two commissioners are "men of conscience and intellectual discipline, capable of judging a particular controversy fairly on the basis of its own circumstances."[13] The cases cited by Continental and IPAA are not in point.[14]

4. *Objections of Texas and New Mexico.*

The states of Texas and New Mexico, besides adopting the briefs and arguments of the Continental Group, assail the Commission decision on grounds peculiar to

---

[12] A motion for the disqualification of Commissioner Black was made to and denied by the Commission. We find no similar motion in the record pertaining to Commissioner Swidler.

[13] United States v. Morgan, 313 U.S. 409, 421. See also Federal Trade Commission v. Cement Institute, 333 U.S. 683, 700-703.

[14] In Texaco, Inc., v. Federal Trade Commission, D.C.Cir., 336 F.2d 754, vacated 381 U.S. 739, the charge was precommitment of a commissioner on the guilt of an accused. In Gilligan, Will & Co. v. Securities and Exchange Commission, 2 Cir., 267 F.2d 461, certiorari denied 361 U.S. 896, a similar charge was made against a commission. Amos Treat & Co. v. Securities and Exchange Commission, D.C.Cir., 306 F.2d 260, related to a charge against a commissioner who had previously served as a staff member in the investigation which led to the complaint.

them in their governmental capacity. They say that the public interest, which the Commission is required to protect, includes the producing states as well as the consuming states; that the prices which the Commission has set will cause a cessation or curtailment of exploration and development activities to the serious injury of the economy of the Permian Basin; that waste rather than conservation of a natural resource will result; and that the states and their public entities will suffer severe losses in taxes and royalty payments.[15] Similar arguments were made by West Virginia in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 607-614, and were rejected by the Supreme Court which said that when Congress passed the Natural Gas Act it "was quite aware of the interests of the producing states in their natural gas supplies" and that nothing in the Act intimates that high prices should be maintained so that "the producing states obtain indirect benefits." The rejection of the state's contentions in Hope requires the rejection of the same contentions here.

Texas and New Mexico also argue that the Commission has unlawfully interfered with their power of taxation. The Commission fixed the rates of gas produced in Texas to include all state taxes and in New Mexico to exclude such taxes. It said that: "In the event of any increase in taxes in Texas or New Mexico, the Commission will consider whether ceiling prices shall be increased and, if so, to what extent." The states' arguments

---

[15] In Texas 4.7 million acres of public lands are within the Permian Basin and in New Mexico over 3 million acres. Much of this land is leased for oil and gas and produces royalty income.

are premature. The Commission has allowed all present taxes as a cost item. Nothing in the Commission decision inhibits the states from increasing those taxes. The Commission has said that if they do, it will determine whether such increases should be passed on to the consumer or remain on the shoulders of the producers. The question of whether increased state taxes will unreasonably burden interstate comerce is hypothetical at this stage.

New Mexico complains that the establishment of a ceiling price plus existing taxes for gas produced in its portion of the Permian Basin denies to it the power to provide a tax incentive to producers by reducing the tax. The argument is not persuasive. If the New Mexico tax was reduced, the Commission could properly consider a rate decrease to reflect the tax decrease.

5. *Legality of Area Rates for Permian Basin.*

The problems confronting federal regulation of the natural-gas business, and particularly the independent producers, have been discussed several times[16] and need be only summarized. The interstate gas business is concerned with a wasting, nonreplenishable natural resource subject to production after discovery. At the point where the gas enters interstate commerce there are few buyers

[16] See opinions of Justice Jackson dissenting in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 628; and concurring in Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 608; dissenting opinion of Justice Douglas in First Phillips, 347 U.S. 672, 687; dissenting opinions of Justice Clark in First Phillips, 347 U.S. 672, 690, and in Second Phillips, 373 U.S. 294, 315; dissenting opinion of Justice Harlan in Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 159; and Opinion No. 338 of the Commission, 24 FPC 537, 542-548.

and thousands of sellers. The producers range from the financially powerful integrated oil companies to the wildcatters who operate on a shoestring. Their results are measured by the amount of gas produced — not by the amount of money invested. Exploration and development costs are financed out of current income and are charged to expense rather than capital. The uncertainty of the business causes substantial cost and revenue fluctuations not only from producer to producer but also from year to year for the same producer. A regulated commodity, gas, is produced in substantial quantities along with an unregulated commodity, oil. The allocation of costs between them baffles the experts and presents the temptation to use mathematical means of arriving at a predetermined result. The same rate may bring a financial windfall to one producer and a financial disaster to another. The price of gas must be competitive with that of other sources of energy and must be sufficiently attractive to encourage a continued search for new supplies.

In Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 582, a case relating to pipeline rates, the Court held that the provisions of the Act were consistent with the due process clause of the Fifth Amendment and within the commerce power. Another pipeline case, Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602, says that in fixing rates the Commission is "not bound by the use of any single formula or combination of formulae"; that "under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling"; and that the impact of the rate order rather than the theory behind

it is, the governing criterion. The "end result" test of Hope was followed in Colorado Interstate Gas Co., v. Federal Power Commission, 324 U.S. 581, 605-606.

Second Phillips, 373 U.S. 294, holds that the Commission did not abuse its discretion in terminating the § 5 investigation of Phillips' rates and substituting an area basis for an individual company basis. The Court reaffirmed the principles announced in Natural, Hope, and Colorado Interstate, recognized the difficulties inherent in the regulation of the price of natural gas, shared the Commission's hopes for the success of the area approach, and observed that the "case might be different if the area approach had little or no chance of being sustained."[17] At the same time, the Court pointed out that "the lawfulness of the area pricing method" was not before it for review.[18] Four justices dissented in an opinion which characterized the area rate policy of the Commission as "a new, untried, untested, inchoate program which, in addition, is of doubtful legality."[19]

In Callery[20] the Court mentioned that the § 7 proceedings before it had at one time been consolidated with the South Louisiana area rate proceedings. Contrary to the argument of the California Distributors the Court did not, tacitly or otherwise, approve area rate regulation. The most pertinent comment is that of Justice Harlan in his concurring and dissenting opinion who said that area

pricing "ultimately aims to simplify proceedings under the statute."[20a]

We cannot accept the arguments of the Commission and the California groups that the Supreme Court has determined the validity of area pricing under the Act. We read the decisions to mean that the Court has permitted the Commission to go forward with the area rate experiment and wishes it good luck in the development of a workable procedure which will be free from constitutional and statutory pitfalls.

Governmental price regulation of services and commodities on a group for geographical basis has been upheld in a number of decisions[21] under the federal commerce and war powers and under state police powers. Those supporting the Commission place great reliance on these decisions. The producers painstakingly distinguish each from the case at bar. We decline to be drawn into these tortuous sidepaths because we are convinced that the "translation of an implication drawn from the special aspects of one statute to a totally different statute is

---

[20a] Id. at 231.

[21] See The New England Divisions Case, 261 U.S. 184 (ICC - divisions of joint rates); Aetna Insurance Co. v. Hyde, 275 U.S. 440 (Missouri regulation of fire insurance rates); Tagg Bros. v. United States, 280 U.S. 420 (Packers and Stockyards Act of 1921); Nebbia v. New York, 291 U.S. 502 (New York Milk Control Act); United States v. Rock Royal Co-op., 307 U.S. 533 (Agricultural Marketing Agreement Act of 1937); Sunshine Anthracite Coal Co. v. Adkins, 310 U.S. 381 (Bituminous Coal Conservation Act); Bowles v. Willingham, 321 U.S. 503 (Emergency Price Control Act of 1942); New York v. United States, 331 U.S. 284 (ICC - railroad rates); and Ayrshire Collieries Corp. v. United States, 335 U.S. 573 (ICC - railroad rates).

treacherous business."[22] Specific reference need be made to only one decision. Several producers emphasize the statement in Bowles v. Willingham, 321 U.S. 503, 517, that in the Natural Gas Act "Congress has provided for the fixing of rates which are just and reasonable in their application to particular persons or companies." The argument is that by this language the Supreme Court has recognized that regulation under the Act is on an individual company rather than group basis. We do not agree. The statement is dicta and whatever value it might have had as dicta was, in our opinion, destroyed by the blessing which the Court gave area rate making in Second Phillips.

Producers urge that the language of the Act is contrary to regulation on a group basis because all pertinent references to natural-gas companies are in the singular. First Phillips holds that an independent producer is a "natural-gas company" within the purview of the Act. Section 2, the definitions section, provides that "person" means an individual or corporation, and defines "natural-gas company" to mean a person engaged in transportation or sale of natural gas in interstate commerce. Section 4, covering the filing and changing of rates, refers to "any natural-gas company," "no natural-gas company," "every natural-gas company," and "the natural-gas company." Section 5, authorizing investigation and determination of rates, refers to "any rate," by "any natural-gas company" and to "such natural-gas company." Section 7 provides for certificates of public convenience and necessity and uses the terms "a natural-gas company," "no natural-gas

[22] Federal Trade Commission v. Bunte Bros., 312 U.S. 349, 353.

company" and "such natural-gas company." The repeated use of the singular rather than the plural is said to require that the just and reasonable rate of each particular seller be tested with reference to its peculiar circumstances and operations.

Opposing arguments point out that the Act does not prohibit group or area rate making and that § 16 empowers the Commission to perform any and all acts and to prescribe such orders, rules, and regulations "as it may find necessary or appropriate to carry out the provisions of this act."

The basic query is whether the just and reasonable standard applies on an individual company basis or on a group basis. Section 4(a) says that "all rates * * * made * * * by any natural-gas company * * * shall be just and reasonable * * * ." If this means that each producer is entitled to a rate which will return its costs plus a reasonable profit, the inquiry is at an end because the Commission refused to receive individual cost figures.

The Natural, Hope, Colorado Interstate, and Second Phillips decisions all support the conclusion that in the regulation of natural-gas rates the Commission is not bound by any formula or method, and that the choice of the appropriate method for the determination of those rates lies in the sound discretion of the Commission. The appropriateness of the method depends on the peculiar characteristics of the natural-gas industry.

In its Opinion No. 338,[23] the Commission noted the reasons why the individual company cost-of-service

[23] 24 FPC 537.

method was inapplicable and unworkable. Among these were the lack of a fixed determinable relationship between investment and service to the public with the result that "a huge investment might yield only a trickle of gas, while a small investment might lead to a bonanza," the staggering allocation problems which could result in such anomalies as widely varying prices for gas coming from a jointly owned lease or even from a jointly owned well, and the intolerable administrative burden of requiring a separate rate determination for each of the several thousand independent producers.

The powerful contrary argument is that no area rate, whether based on composite costs, average aggregate costs or any other industry wide criteria, will suffice to assure a high cost producer of its costs to say nothing of a profit. We accept this as true.[24] The impact of an area rate in the natural-gas industry may have effects which cover the entire range from bonanza to bankruptcy. It is sufficient for us that these results were lucidly demonstrated in the dissenting opinion of Justice Clark in Second Phillips and did not deter the majority from allowing the Commission to proceed with its area rate program.

Some of the producers argue that if the Act is construed to permit area rate making, the Act is invalid under

[24] An appendix to the Hunt brief presents an array of natural-gas costs of 44 Permian producers whose volumes total over 208 million Mcf. Of these, 16 producing over 170 million Mcf are shown to have costs of less than 14.5 cents. The remainder have costs running from 14.77 cents to 216.05 cents. We have been unable to check the accuracy of these figures and mention them only to show the claimed disparity of costs. Continental says that "approximately 67 percent of the companies and approximately 30 percent of the volumes had costs above the industry average cost level."

Art. I, § 1, of the United States Constitution because no legislative standards have been set for establishing groups or making group determinations. Reliance is had on Panama Refining Co. v. Ryan, 293 U.S. 388, which held that a delegation of legislative power to the President was unconstitutional because Congress, among other things, "has declared no policy, has established no standard, has laid down no rule."[25]

Congress cannot delegate its power to enact laws but it can confer on an administrative agency the power to carry into effect laws which it has enacted.[26] In the New England Divisions Case, supra, the Court referred to the power given by Congress to the Interstate Commerce Commission to determine just and reasonable rates and said that Congress "intended that a method should be pursued by which the task * * * could be performed."[27] In Lichter v. United States, 334 U.S. 742, 785-786, the Court in discussing legislative standards said that the "standards prescribed by Congress are to be read in the light of the conditions to which they are applied" and for an example observed that "among those which have been held to state a sufficiently definite standard for administrative action [are] 'just and reasonable' rates for sales of natural gas."

In the regulation of the natural-gas industry "the actual necessities of procedure and administration"[28] have led to the adoption of the area rate method. We believe that

[25] 293 U.S. 388, 430.

[26] Crain v. First National Bank of Oregon, Portland, 9 Cir., 324 F.2d 532, 537.

[27] 261 U.S. 184, 197.

[28] Id. at 198.

neither constitutional nor statutory provisions prevent the use of that method and that the Commission did not abuse its discretion in adopting it. The more important and difficult question is that of the validity of the area rates which have been established. The controlling standard is the end result test of Hope. In our opinion, this test is accepted by, and reaffirmed in, the Second Phillips decision.

Some of the producers urge that the area rate method is not consistent with the characteristics of the industry and that contract prices satisfy statutory requirements because they have been reached through effective competition. The Commission considered and rejected the argument. It pointed to the history of price negotiations in the Permian Basin, to the urgent requirements of the pipelines, to the heavy percentage of sales by a few producers, and to the control of undisclosed and uncommitted gas reserves by a few producers. It concluded that the record fails to establish that a just and reasonable rate can be established through competition and that "the primary competition revealed by the record was among the pipelines to secure new gas supplies at higher prices." Commissioner O'Connor disagreed saying that "the contract price at which most producers are able and willing to operate is just and reasonable." His conclusion was that "profit oriented costs and supply oriented contracts do not, in the aggregate, depart in any significant manner from each other." We accept the conclusion of the Commission that competition has not been effective to fix a just and reasonable rate. It is supported by reasonable inferences from the record and they are binding on us.

Continental and Superior say that they were improperly denied an opportunity to be heard on the geographical propriety of the Permian Basin as a rate area. In its order instituting the proceedings the Commission eliminated the issue of the appropriateness of the area for rate making purposes.[29] The Commission may draw on its expertise to determine the ground rules for an investigation but in so doing may not deny a specific right.[30] The producers fail to convince us that any such denial has occurred here. The Permian Basin is a well known area. Unless prices are to be determined on a national basis, areas must be selected and defined. The Commission had two choices. It could first determine the national revenue requirement and divide that up among the areas or it could first determine the various rates so that in the aggregate they meet that requirement. We are unwilling to assume that when all the area proceedings are completed the total revenue will not equal the national requirement. If it does not, both the producers and the consumers will suffer. In our opinion the Commission acted reasonably in selecting the Permian Basin for an area rate proceeding.

6. *The Two-Price System.*

The Commission's two-price system is vigorously attacked on many fronts. It will be remembered that one price is fixed for new gas-well gas and another for flowing gas. All agree that gas is a commodity which is valuable as a source of energy. The householder does

[29] 24 FPC 1121, 1122.

[30] Amax Petroleum Corporation v. Federal Power Commission, 10 Cir., 350 F.2d 92, 94.

not care whether the gas which burns at the tip of his appliance comes from a gas well, an oil well, or as a residue product. To him gas is gas.

The justification for the two-price system is that the higher price for new gas-well gas provides an incentive to explore for and develop new supplies. The producers do not question the finding that "the industry is increasingly becoming able to direct its exploration efforts toward finding new gas-well gas as distinguished from finding gas as a by-product in the search for oil." This ability may be confined to the larger companies which maintain the technical staffs skilled in making the necessary predictions. The smaller producers are in a less advantageous position. They may be relegated to the farmouts which the majors pass down to them or to operations in accord with their less scientific but sometimes financially rewarding hunches.

New gas discoveries are well said to be the life blood of the industry. The consumers may reasonably be required to pay the price needed to bring forth such discoveries. If an incentive price based on current costs is used for all gas, windfalls will be assured to many producers of old gas developed under lower historical costs and often found in association with oil.

The producers say that a single-price system based on current costs is required because revenues for current exploration and development must be internally generated from sales of gas from whatever source. The Commission rejected the argument. The question is not so much the source of the funds as it is the inducement to use available funds in the search for gas. The higher

price for new gas is intended to supply that inducement. Although the adequacy of the inducement can only be tested by future developments, we are not convinced that the refusal of the Commission to include the same inducement in the price of old gas, with the resulting likelihood of windfalls, was unreasonable.

Continental, Phillips, and others argue that the two-price system amounts to entrapment because of the possibility of reduction in price after financial commitments have been made. Although the Commission which announced the Permian Basin decision cannot bind a future Commission, we credit the Commission with good faith. The possibility of a change does not invalidate the rate method employed. When and if a reduction occurs, the argument of entrapment can be heard.

The division date of January 1, 1961, for the different prices of new gas-well gas and old gas-well gas is another subject of dispute. Here the Commission found as a fact that the appropriate date was the approximate time when directional drilling came to be used effectively. Under the evidence the selection of a division date was an administrative problem calling for the exercise of judgment. In making its choice the Commission acted within the evidence and within its powers. On rehearing, the Commission left open for future consideration the problem arising when new gas-well gas is developed from committed acreage. We assume that this problem will be met fairly when it comes to a head.

The two-price system is an outgrowth of directional drilling for gas. Its purpose is to assure a continued gas supply. The Commission frankly says that the adoption

of the system for the Permian Basin "should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies." We find no persuasive reason why the test should not be made.

7. *The Cost Information.*

In arriving at the Permian Basin rates the Commission used many sources of cost information. These included responses to questionnaires sent to producers, the Census of Mineral Industries for 1958, the Chase Manhattan Bank's 1961 Annual Analysis of the Petroleum Industry, the World Oil Magazine, the Oil and Gas Journal, the Joint Association Survey,[31] and others. The producers attack these sources on many and varied grounds. The range of objections runs from hearsay evidence through deprivation of right of cross-examination to denial of procedural due process. To take up each of these objections would increase the length of this opinion to encyclopedic dimensions.

From the information so obtained the parties, the staff, and the Commission make many computations and reach many results. The assumptions, allocations, formulae, equations, averages, means, and massive calculations may intrigue a mathematician or statistician but they have no attraction for us. We respectfully decline to be drawn into such a turmoil of numbers. We cannot in a few months unravel the snarl of statistics developed in the years of hearings. In our opinion the judicial process,

[31] This is a survey of a few producers conducted by the American Petroleum Institute, the IPAA, and the Mid-Continent Oil and Gas Association.

in cases such as this, should be confined to consideration of errors of law. We leave to the experts the selection of source material and the calculations to be made therefrom. Our concern is with the result.

8. *The Commission's Price Determinations.*

The Commission said that "costs must be a major factor in determining the area price." On the basis of current national statistics plus questionnaire data it determined the 1960 Mcf cost of new gas-well gas thus:

Exploration and Development Costs	
Dry Holes	1.42 cents
Other Exploratory Costs	1.59
Adjustment for Exploration in Excess of Production	1.11
Production Operating Expense	2.70
Net Liquid Credit	(3.10)
Regulatory Expense	.14
Depletion, Depreciation, and Amortization of Production Investment Costs	
Successful Well Costs	2.88
Lease Acquisition Costs	.76
Cost of Other Production Facilities	.31
Return of Production Investment[3] *(at 12%)*	5.21[32]
Return on Working Capital	.35
Subtotal	13.37
Royalty at 12½ percent	2.05
Production Taxes	1.01
Total	16.43

[32] This is computed as follows: The production investment is the sum of successful well costs, lease acquisition costs, and cost of other production facilities or a total of 3.95 cents. It is to be recouped over an average period of 10 years beginning an average of one year after investment. Accordingly, the return is allowed on an investment base 11 times the production investment of 3.95 cents per Mcf or 43.45 cents. 12% of this figure is 5.21 cents per Mcf.

The Commission rounded this figure off at 16.5 cents for the Texas production. Because the New Mexico figure is exclusive of taxes a reduction of one cent was made in the New Mexico price.

For the costing of flowing gas the Commission used historical data developed by the industry questionnaires. The results may be summarized thus:

Production operating expenses	1.75 cents
Depreciation, depletion and amortization	2.42
Return at 12%	4.99
Exploration and development	4.08
Regulatory expense	.14
	13.38
State production tax at 7%	1.01
	14.39[33]

This figure was rounded off at 14.5 cents for Texas and 13.5 cents for New Mexico. As a check on the method used the Commission back-trended the new gas-well gas figures and arrived at a 14.64-cent price.

The rates so established are subject to downward adjustment because of quality deficiencies and to both downward and upward adjustments on the basis of Btu content. The Commission disclaims any intent that the rate figures show producer costs. It says that the price of new gas-well gas is "geared" to costs derived from national statistics and the questionnaire data and that for flowing gas the "touchstone" is the historical price of Per-

[33] No separate item was included for royalty payments because costs were computed on ⅞ of actual volumes.

mian gas.[34] Other undefined and unidentified "factors" were taken into consideration.

9. *The Moratorium.*

The Commission implemented the price provisions of the decision in various ways. It imposed a moratorium on rate increases until January 1, 1968, "except in compliance with a specific order of the Commission for a rate as determined pursuant to said proceeding [AR61-1] or pursuant to later order of the Commission." The producers say this violates the Act because § 4 permits filings for rate increases. Section 4 must be read with other sections of the Act. Section 5 authorizes the Commission to determine the just and reasonable rate "to be thereafter observed and in force." Section 16 gives the Commission power to make such orders "as it may find necessary or appropriate to carry out the provisions of this act." In Callery the Court held that there was ample power under § 7(e) to impose a moratorium.[35] We believe that there is also ample power under §§ 5(a) and 16. The reasonableness of the exercise of the power is established by the need for price stability, the Commission's expressed willingness to reopen the proceedings to consider the propriety of changes, and the expiration date which is only about a year off.

10. *The Escalation Clauses.*

The Commission's order forbids the filing of rate changes in excess of applicable area rates when the con-

[34] In Opinion No. 468 the Commission said: "Nevertheless, we make clear that we do not confine ourselves to a cost calculation in determining just and reasonable rates."

[35] 382 U.S. 223, 228.

tractual, right thereto is based on indefinite escalation clauses not permitted by § 154.93(a), (b), and (c) of the Regulations under the Natural Gas Act. The producers say that this provision destroys existing contract rights. The Commission replies that it has not proscribed the clauses but merely the right to file under them. This is a thin distinction. In Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F.2d 241, 245, we upheld § 154.93 and pointed out that if a producer felt aggrieved thereby it could apply for a rule waiver under § 1.7(b) of the Commission's Rules of Practice and Procedure. We assume that a similar request could be made under the Permian order. When the request is made and rejected, the time will arrive for the consideration of the constitutional questions which the producers raise.

11. *The Commission's Fair Relationship Standard.*

In fixing the amounts of the area rates the Commission rejected the end result test and adopted a fair relationship standard. This appears clearly from Opinion No. 468-A. After disclaiming that it had made any finding that "jurisdictional revenues will equate to jurisdictional costs," the Commission said:

> "* * * we are convinced that the record fully justifies the Commission's judgment that the ceiling prices we have fixed 'provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur' in the Permian Basin."

Hope says that in the fixing of just and reasonable rates there must be a "balancing of the investor and the consumer interests."[36] It goes on to say that from the com-

[36] 320 U.S. 591, 603.

pany point of view the revenue must not only provide operation expense but also capital costs including "service on the debt and dividends on the stock"; and that the return to the equity owner must be commensurate "with returns on investments in other enterprises having corresponding risks" and "sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital."[37] The Court concluded the discussion of this problem with the observation that in Hope the "end result" could not be condemned as unjust and unreasonable.

In Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 605, the Court, after referring to the Natural and Hope decisions said:

> "In those cases we held that the question for the courts when a rate order is challenged is whether the order viewed in its entirety and measured by its end results meets the requirements of the Act."

Also pertinent is the statement of the Court in Second Phillips that:[38]

> "To whatever extent the matter of costs may be a requisite element in rate regulation, we have no indication that the area method will fall short of statutory or constitutional standards. The Commission has stated in its opinion in this proceeding that the goal is to have rates based on the 'reasonable financial requirements of the industry' in each production area, * * * and we were advised at oral argument that composite cost-of-service data will be considered in the area rate proceedings."

Nothing in Second Phillips rejects the end result test of Hope. We believe that it applies here and that it is not

[37] Ibid.

[38] 373 U.S. 294, 309-310.

satisfied by a finding of fair relationship. Something more than mere semantics is involved. The determination of a fair rate from the standpoint of the consumers must depend to large extent on the informed judgment of the regulatory agency. In these proceedings no distributor, consumer interest, or consumer representative objects to the rates. They are accepted as just and reasonable.

From the standpoint of the producer the situation is different. It is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. These requirements must be tested against the record. They may not be brushed aside with a general finding of fair relationship. The Commission concedes that it did not equate jurisdictional costs to jurisdictional revenues. This is obvious because no determination was made of the jurisdictional revenues which the rates will produce.

12. *The High Cost Operator and the Small Producer.*

The Commission broke down the rates into components which it justified on averages based on national statistics and questionnaire data. We recognize that weighted averages and sifted averages are suspect.[39] We accept the principle that both the basic figures and the averages obtained therefrom must be typical and representative but we are not convinced that the Commission has misused its expertise in this technical field. It is self-evident that when average costs are used to compute ceiling prices, the high cost operator will be hurt and some low cost operators may receive windfalls. Probably

[39] See United States v. Abilene & Southern Railway Company, 265 U.S. 274, 291, and Interstate Commerce Commission v. Mechling, 330 U.S. 567, 583.

to a greater extent than in any other comparable segment of the national economy the element of chance can affect the success or failure of even the most prudent enterpreneur who engages in the natural-gas business.

The problem of the high cost operator is characteristic of group or area rate making. The Supreme Court upheld group rates in Acker v. United States, 298 U.S. 426, 431, and commented that "regulation cannot be frustrated by a requirement that the rate be made to compensate extravagant or unnecessary costs." In Tagg Brothers v. United States, D.C.Neb. 29 F.2d 750, 755, affirmed 280 U.S. 420, the court said that it was not necessary "to fix the rates so high that all agencies in the business would make money." Covington & Lexington Turnpike Road Company v. Sanford, 164 U.S. 578, 596, says that "the public cannot properly be subjected to unreasonable rates in order simply that stockholders may earn dividends."

The small producers, represented here by Big Chief Drilling Company, IPAA, Texas Independent Producers & Royalty Owners Association (TIPRO), J. C. Barnes, and others, join in the prediction that the Permian decision sounds the death knell of the small producers. Perhaps the flamboyant wildcatter must be replaced by the scientists of the industrial giants but the efforts of the boom-or-bust adventurers have contributed greatly to natural-gas discoveries. In its decision the Commission referred to the "smaller independent who traditionally drills much of the Permian exploratory acreage" and said that: "Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators who con-

tribute a large share of the discoveries of new sources of gas."[40]

The Commission took note of the suggestions that small producers should be exempt from regulation.[41] It found that outright exemption was neither necessary nor desirable but said that the small producers needed "special treatment." To this end it defined a small producer as "a natural gas company selling jurisdictionally less than 10,000,000 Mcf annually on a nationwide basis." They were granted relief from various requirements of §§ 7 and 4 and were freed from rate adjustments because of quality differentials. In our opinion the classification is reasonable and within the Act.

The small producers do not seek complete exemption. Their attitude is that such relief would be illusory rather than real because the pipelines would not pay more for gas supplied by them than the price paid to the major companies. Their complaint is that the Commission did not give adequate consideration to small producers' costs.

Data covering the costs of Permian producers came from questionnaires which are classified as Appendix B and Appendix C. The Appendix B group was mandatory for producers with company-wide jurisdictional sales of over 10 million Mcf and optional for others.[42] The

---

[40] Big Chief asserts that the small producers, although credited with only 20% of current production volumes, actually drill almost 40% of all successful gas wells and 50% of all successful exploratory gas wells.

[41] See statements of Justice Clark dissenting in Second Phillips, 373 U.S. 294, 329-330, and speaking for the Court in Federal Power Commission v. Hunt, 376 U.S. 515, 527.

[42] Appendix A pertained to well and drilling statistics. It is not pertinent here.

Appendix C questionnaires went to the small producers. Forty-two of the majors and 25 of the small producers answered Appendix B. The response to the Appendix C questionnaires was sporadic. The Commission used only the material supplied by the majors saying that the inclusion of the data supplied by the small producers "does not affect the results."

TIPRO and Big Chief both emphasize the testimony of a staff witness that the small producer questionnaire showed average unit costs 2 cents per Mcf higher than those of the majors. They argue that the end result standards must be applied not only to the entire group but to them as a group. The weakness of the argument is that once the whole group is split the process can be carried on until the regulation is back on an individual company basis.

We do not know the answer to the small producer problem. Superficially it seems unfair to fix ceiling prices for all producers, both large and small, on the basis of the costs of large producers only. The Commission rejected the small producer data because in its opinion the impact on the rate structure was de minimis. On the record presented, we are unwilling to say that this conclusion was erroneous as a matter of law.

In any regulation of the natural-gas industry on an area basis the high cost producers, be they majors or little fellows, are certain to be placed in a position less advantageous than that occupied by those whose good fortune and able management have supplied a lower cost base. We agree with the Commission that the expense items included in an individual cost-of-service are not

the measure of a confiscatory rate. A producer has no constitutional right to be reimbursed for dry-hole expenses.[43] Also it has no obligation to remain in business by replenishing the supplies of gas which form the basis of present obligations. Inability to continue exploration and development is not confiscation. We conclude that the impact of the Permian rates on the high cost producers does not destroy the area rate method.

13. *Gathering and Processing Costs.*

One subject of much discussion in the briefs is the allowance of the same rate for gas delivered at the tailgate of a processing plant and for gas delivered at the wellhead. Gathering lines cost money and have to be built and operated by someone. The Commission's position is that the revenues received for oil and oil products derived from condensation and processing return a profit which induces the building of the needed gathering lines and plants. Here again we reach the troublesome field of cost allocations between a regulated commodity, gas, and unregulated commodities, oil and liquified petroleum products.

Bass places particular emphasis on this phase of the case. It points to its extensive investments in gathering lines and plants and to its permanently certificated rate of 18 cents which, it says, the Commission has never specifically found unreasonable or discriminatory. The answer as we see it is that if area rates are proper no greater need exists for the consideration of the individual cost and revenue requirements in the case of Bass than

[43] Cf. Columbus Gas & Fuel Co. v. Public Utilities Commission of Ohio, 292 U.S. 398, 407.

in the case of the other producers. Perhaps in the future courts will have to explore the mysteries of allocations but we are not so inclined in this case. If in fact Bass and others similarly situated are confronted with confiscation, a way must be open for them to be heard.

14. *Special Exemptions.*

The Commission recognized that some provision must be made for special exemption from area rates. It said that when a producer's "out-of-pocket expenses in connection with the operation of a particular well are greater than the revenues under the applicable area price, he should be entitled to appropriate relief." It declined to "specify all of the special circumstances which may serve as a basis for exceptions to the area rate" and observed that failure to earn exploration and development expenses plus the allowed return does not amount to confiscation. In regard to the form of relief it held that "it may be sufficient to permit them to abandon their unprofitable sales."

We agree with the Commission that an escape clause cannot be used to convert an area rate into an individual company cost-of-service rate but an escape clause which does no more than prevent an unconstitutional confiscation amounts to nothing. None is needed for that purpose. The producers are right in saying that the Commission's exemption provisions are so vague and nebulous that neither they nor a court can determine what relief is being granted. Out-of-pocket expenses are not defined and we do not know what they include. If a producer's accounting is on a lease rather than well basis, the facts relating to a particular well might not be determinable.

It may be going too far to say categorically that individual producers should be permitted to show that the group costs are not typical or representative of their costs but in some instances that should be permitted. Conservation of gas is promoted if marginal wells are allowed to continue to produce but is discouraged if the same wells are shut down by a low price. Some producers furnish gathering facilities. Others sell at the wellhead and the pipelines pay for the gathering. Gathering costs are allowed pipelines. Perhaps in some instances they should be allowed to producers. An adequate savings clause should contain guidelines which if followed by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided. It is not enough to say in effect that confiscation will be prevented. Confiscation is an individual proposition and the individual is entitled to be heard. We are convinced that the Commission's special exemption provisions are inadequate.

15. *Quality Standards.*

The Commission provided for adjustments in the area rates to reflect quality differentials. It said that "the price of gas cannot be related to volume alone but must be related to units of energy free of impurities and sufficiently compressed to enter the pipeline." Standards were fixed for content of carbon dioxide, hydrogen sulphide, total sulphur, water, and other impurities; and the amount of delivery pressure was established. The applicable base area rate is adjusted downward by the net cost of processing the gas to bring it up to standard. Provision is made for both an upward and a downward adjustment of rate depending on the Btu content. Quality

statements are required to be filed together with an agreement by the seller and the buyer covering the cost of bringing the gas up to standard. If an agreement cannot be reached, each shall file a statement of its views on the processing costs.

About 90% of the flowing gas is substandard. We are cited to no figures on the similar percentage of new gas-well gas. The amount of the rate adjustments does not appear in the record because there was no evidence of the extent of quality differentials or of the processing costs of bringing the gas up to standard.[44] At oral argument various estimates were given as to the amount of rate reduction which would result from substandard quality. These were based on statements filed pursuant to the decision but after the record was closed. They ranged from .7 cents to 2.0 cents per Mcf. A spokesman for the Continental Group said that on 1960 volumes a revenue deficiency of some $12 million a year would result. The Commission response in this court to the Skelly motion for stay of the Commission's orders herein said that the reductions in applicable rates because of adjustments for quality standards are expected to result in a revenue reduction of about $10 million annually.[45]

The producers' argument that the imposition of quality standards violates procedural due process because of lack

[44] The Commission says in its brief that "appropriate price differentials or adjustments could not be made on the basis of the record."

[45] The statement was this: "It has been estimated that the reductions to the base rates alone will reduce the revenues from jurisdictional Permian sales by about $10 million annually. The adjustments for quality standards, which were substantially altered by Opinion 468-A * * * are expected to result in a further reduction of the same magnitude."

of notice need not be resolved at this time. We are remanding the case and now everyone has notice. The matter of the Btu adjustments presents a particular problem which was emphasized by Commissioner O'Connor in his dissent. The price goes down if the Btu content is below 1,000 and goes up if it is above 1,050. The producers say the adjustment upward should begin at 1,000. We do not understand the Commission's reasons for the gap. On remand this can be clarified.

16. *The Rate of Return.*

The Commission says that the impact of the quality adjustments is taken care of in the rate of return which is made generous on this account. It fixed a rate of return of 12% on production activities and held that such rate "protects gas consumers against excessive prices but it is not so low that it fails to respond to the needs of the industry." The principles applicable to the determination of an appropriate return are set forth in Bluefield Water Works & Improvement Co. v. Public Service Commission, 262 U.S. 679, 692-693. It "must be determined by the exercise of a fair and enlightened judgment, having regard to all relevant facts." The rates of a public utility should "permit it to earn a return on the value of the property * * * equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties" but the utility has no constitutional right to profits realized by "highly profitable enterprises or speculative ventures." The return should assure "confidence in the financial soundness of the utility" and be adequate under prudent management "to maintain and support its credit and en-

able it to raise the money necessary for the proper discharge of its public duties." The Hope decision[46] states the same basic principles.

The Commission recognized these controlling principles. The objections of the producers are to the point that the allowed rate of return is inadequate to enable the industry to attain the goals which the principles contemplate. At this time there is no need for us to go into the comparisons of the returns appropriate for producers as opposed to pipelines or to the financing methods employed by either. The fact is that by treating quality deductions as a risk rather than a cost the Commission has made it impossible to determine the amount of return with any degree of certainty. The difficulty is that the record does not disclose the amount of deductions.

A fair rate of return cannot be ascertained with mathematical certainty.[47] Pragmatic adjustments may be made by an agency within the ambit of its statutory authority.[48] A court must put great reliance on agency expertise in evaluating a rate of return but this does not mean that a court must accept the agency determination in blind faith. A producer is entitled to a higher rate of return than a pipeline because of the greater risk of the business. The Commission has here compounded the risk of discovery with the risk of substandard quality.

We believe that the price reductions to reflect quality deviations are an item of cost rather than an item of risk

[46] 320 U.S. 591, 603.

[47] Colorado Interstate Gas Co. v. Federal Power Commission, 10 Cir., 142 F.2d 943, 961-962, affirmed 324 U.S. 581.

[48] Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 586.

and should be directly reflected in the applicable base rates instead of hidden in a rate of return allowance. The amount of cost is the expense of bringing the quality up to standard. In the Permian Basin sound reason exists for this conclusion because of the known and substantial quality deficiencies particularly in flowing gas production. We find it hard to understand why a revenue deficiency in the estimated amount of $10 million annually should be classified as a risk and not a cost. A risk occurs as the result of unknown or unconsidered contingencies. In the Permian Basin it is known and considered that flowing gas falls short of pipeline standards. In any event, the lack of evidence as to quality deductions makes it impossible to determine whether the rate of return satisfies the Bluefield and Hope principles and we have no basis on which to appraise the allowance made by the Commission. We respect the expertise of the Commission but the conclusions reached by the use of expertise must accord with legal standards.

17. *Contract Limitations.*

The producers say that recovery of industry costs under the area rates is impossible because many of the existing contracts do not permit a producer to file for the flowing gas ceiling price of 14.5 cents. The Commission recognized that "there undoubtedly will be some contract prices lower than the area rate ceiling, as adjusted for quality." Some of the producers estimate the deficiency because of contract limitations to be $14.4 million in the test year of 1960. The Commission has estimated that a reduction of base rates alone will result in a revenue reduction of about $10 million annually.[49]

[49]See supra, note 45.

CARD 16

It is elementary that gas prices are originally set by contract between the producer and the pipeline, that the producer may not raise the price unilaterally, and that any increase in price must be within contract terms unless the price is set so low as to affect the public interest. The Commission says that the producers are not entitled as a matter of right to collect contract rates that are higher than otherwise reasonable in order to offset other rates limited by contract to below maximum reasonable levels. Regulation does not guarantee an over-all profit;[50] relief from an unduly low rate may be given only if the rate is "so low as to adversely affect the public interest — as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory";[51] and a company's losses in one instance do not justify an illegal gain in another instance.[52] At the same time in such group procedures as the division of railroad rates the Interstate Commerce Commission, with court approval, has recognized that revenue from one source may balance that from another.[53]

Contract limitations are one of the facts of life for the natural-gas industry. They are the outgrowth of the days when gas, which had previously been vented, flared, or capped, became salable to the newly constructed inter-

state pipelines. The pipelines wanted long-term contracts and the producers wanted to sell their gas. Prices were low. With the phenomenal increase in the use of gas as an energy source the prices rose. The producers whose contracts either contained no escalation clauses or clauses of the type proscribed by the Commission were in a disadvantageous position. Even permissible escalations do not, in many instances, bring the 1960 price up to the area ceiling. In Second Phillips the Court upheld the termination of certain § 4(e) dockets on the Commission's finding that "the annual increase in revenue produced by these increased rates was substantially less than the deficit for the test year 1954."[54] The same situation exists here for many companies. We do not know whether it exists for the area producers as a group because no finding was made of revenue and requirements. The Supreme Court has said that losses in one instance do not justify illegal gains in another. To us this means that the contract limitations do not preclude the establishment of a just and reasonable area rate. The answer is provision for a minimum rate.

The Commission held that "the establishment of minimum rates in this case is in the public interest and that the price impact on the consumer will be de minimis." It established a minimum rate of 9 cents per Mcf for gas of standard pipeline quality. We believe that the controlling question is whether the proper revenue requirements of the area producers as a group can be satisfied with rates having the ceiling and the floor which the Commission has fixed. This cannot be answered because

---

[54] 373 U.S. 294, 305.

the financial impact of the quality deductions is not ascertainable from the record.

18. *Refunds.*

The revenue deficiency argument of the producers leads directly to the refund issue. The Commission required "appropriate refunds in the case of rates which are the subject of proceedings under Section 4(e) of the Act, and have thus been collected subject to an obligation to refund amounts collected in excess of the just and reasonable rates as here determined." Procedures to accomplish this result were set up in detail.

The producers say that these individual company refunds are not proper because of the revenue deficiency of the industry. They say that in the test year of 1960 the producers in the area failed to meet their revenue requirements by $14.4 million and they estimate the refunds for that year under the Commission decision to approximate $6 million.

The Examiner held that refunds should be ordered only to the extent that over-all industry revenues exceed over-all industry expenditures in a given year. The Commission said that this theory was unworkable because it would result in inequities among both the buyers and the producers and because of "insurmountable" administrative difficulties. We are at a loss to understand how refund obligations, which might come into existence under the Examiner's approach, would be divided among the producers.

We see no escape from the requirement that refunds be on an individual company basis and on a schedule by

schedule basis. As we understand Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, 153, refunds are appropriate for each excessive rate regardless of over-all revenues. The Commission has required refunds only on § 4(e) rate increases above the applicable area ceiling. If a producer claims that the refunds required of it are confiscatory or harmful to the public interest, it must have an opportunity to petition for special relief. A similar opportunity must be afforded if a producer can show that a refund is required for collections at or below the "last clean rate."[55] An adequate special exemption clause can take care of such situations.

19. *The End Result Test.*

This brings us back to the end result test. The Continental Group, which includes many large producers and major integrated oil companies and which is supported by Phillips, presents alternative arguments. The first is economic. It is said that regulation under the Act must be consistent with the economic characteristics of the industry; that this requires the establishment of market prices based on contracts; that a cost-based system of regulatory rates does not recognize the responsiveness of the gas supply to gas prices; and that a producer does not explore on the expectation of a return of its cost plus a return on its investment but on the hope of getting back many times what it expends as a reward for its gambler's risk. No doubt these are the economic facts of the industry.

---

[55] By "last clean rate" is meant the last rate in effect pursuant to a permanent certificate not subject to any refund obligation.

The divorce of commodity value from costs was suggested by Justice Jackson in his dissent in Hope. He commented that a producer would have difficulty showing the invalidity of a fixed commodity value so long as it voluntarily continued to sell its product in interstate commerce.[56] One difficulty with this suggestion is that once the gas is committed no withdrawal from interstate movement is possible without Commission approval.[57] A producer can stop exploration and development if it is dissatisfied with price but the interstate sales go on with a continuing impact of cost on price and of price on exploration and development. In any event the majority rejected the proposal and held that under the just and reasonable standard of the Act a regulated company is entitled to revenue for operating expenses and capital costs and to a return "commensurate with returns on investments in other enterprises having corresponding risks."[58] These standards cannot be met without consideration of costs and revenues. In our opinion the Hope construction of the statutory standard casts serious doubts on the validity of the adoption of a contract-based commodity value.

The alternate argument of the Continental Group is that if the rates are to be determined on a composite cost-of-service basis, the revenue requirements of the industry must be found and rates fixed to meet those requirements. In Second Phillips the Court particularly noted the assurance of the Commission that "composite cost-of-service

[56] 320 U.S. 591, 652.

[57] Section 7(b) of the Act. See also Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 156.

[58] 320 U.S. 591, 603.

data will be considered in the area rate proceedings."[59] Consideration of such data does not eliminate consideration of other factors. At the same time Second Phillips did not reject the end result test of Hope. Instead it quoted a portion of that opinion which said among other things that "it is the result reached not the method employed which is controlling."[60]

The Commission rejected both alternatives of the Continental Group. It said that commodity value established by contracts may not be used because of the absence of effective competition; and it emphasized that it took into consideration factors other than costs. The record does not disclose what these other factors were but they must have had some economic basis. The Commission held that its ceiling prices provided a "fair relationship" between consumer prices and producer costs. Fair relationship is pertinent but it is only part of the end result test. We do not know the producers' costs or revenue requirements. We do not know the economic factors which either require or permit departure from costs and revenues. The end result test is not satisfied by a reliance on unknowns.

We have accepted the Commission's conclusion that contract rates should not be used. The trouble is that the Commission decision rides two horses and we have no way of knowing the outcome of the race. It uses composite cost-of-service evidence, engrafts economic factors on top, and comes out with a rate which it justifies on a fair relationship basis. We have the problem of how in such circumstances a court can determine whether the

[59] 373 U.S. 294, 310.

[60] Id. at 309.

just and reasonable standard of §§ 4 and 5 has been met. The answer is not found in the record before us.

The facts sustaining the conclusion of fair relationship must be found. The Commission did not make those findings and indeed it could not have done so because of the failure of the record to disclose the revenue impact of the adjustments in area rates to reflect quality differentials. Whether rate reductions because of quality deficiencies are a risk or a cost, the answer comes out the same. If they are a risk, we do not know the rate of return. If they are a cost, we do not know whether the revenue received will equal the reasonable revenue requirements. We believe that under Hope, and under Second Phillips, the area producers, as a group, are entitled to recover their prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. Satisfaction of this requirement must appear through appropriate findings based on substantial evidence. These cannot be made on the record presented. The decision of the Commission is not saved by the special exemption provisions which we find to be insufficient and unsatisfactory.

Rate making under the Act has produced a superabundance of delay and litigation. Much gas has moved through the pipelines since the First Phillips decision. We wonder if the time has not come for the establishment of a better rapport among the Commission, the consumers, the distributors, the pipelines, and the producers. Some practical means of resolving the economic and legal issues is highly desirable. The Commission has approved many settlements. The use of this procedure may well

be explored further in an effort to obtain a true "balancing of the investor and the consumer interests."[61]

One point remains to be mentioned. Eleven motions for leave to adduce additional evidence were filed with us by various producers. We deferred all to the hearing on the merits. In view of the disposition which we make of the cases we see no reasons to explore evidentiary problems which may arise on remand. The Commission will hold such additional hearings as are needed to determine the effect of the quality adjustments, and to determine the group revenues and the group [illegible] requirements. It will make appropriate findings on those matters. The order based thereon shall contain an adequate provision for special exemptions. We decline to make advance rulings on the procedures to be followed or on the evidence to be received.

The motions to adduce additional evidence are severally denied. The petitions to review are severally granted and the cases are all remanded to the Commission for further proceedings consistent with this opinion.

---

[61] 320 U.S. 591, 603.

APPENDIX B

Rates And Charges; Schedules; Suspension Of New Rates

Sec. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b) No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c) Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services.

(d) Unless the Commission otherwise orders, no change shall be made by any natural-gas company in any such rate, charge, classification, or service, or in any rule, regulations, or contract relating thereto, except after thirty days' notice to the Commission and to the public. Such notice shall be given by filing with the Commission and keeping open for public inspection new schedules stating plainly the change or changes to be made in the schedule or schedules then in force and the time when the change or changes will go into effect. The Commission, for good cause shown, may allow changes to take effect without requiring the thirty days' notice herein provided for by an order specifying the changes so to be made and the time when they shall take effect and the manner in which they shall be filed and published.

(e) Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, State commission, or gas distributing company or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time when it would otherwise go into

effect; and after full hearings either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natural-gas company to furnish a bond, to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and, upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas company, and the Commission shall give to the hearing and decision of such questions preference over other questions pending before it and decide the same as speedily as possible. [52 Stat. 822 (1938); 76 Stat. 72 (1962); 15 U.S.C. § 717c]

Fixing Rate And Charges; Determination Of Cost Of Production Or Transportation

SEC. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any

State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,* That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural-gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural-gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

(b) The Commission upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas. [52 Stat. 823 (1938); 15 U.S.C. § 717d]

Administration Powers of Commission; Rules, Regulations, and Orders

Sec. 16. The Commission shall have power to perform any and all acts, and to prescribe, issue, make, amend, and rescind such orders, rules and regulations as it may find necessary or appropriate to carry out the provisions of this act. Among other things, such rules and regulations may define accounting, technical, and trade terms used in this act; and may prescribe the form or forms of all statements, declarations, applications, and reports to be filed with the Commission, the information which they shall contain, and the time within which they shall be filed. Unless a different date is specified therein, rules and regulations of the Commission shall be effective thirty days after publication in the manner which the Commission shall prescribe. Orders of the Commission shall be effective on the date and in the manner which the Commission shall prescribe. For the purposes of its rules and regulations, the Commission may classify persons and matters within its jurisdiction and prescribe different requirements for different classes of persons or matters. All rules and regulations of the Commission shall be filed with its secretary and shall be kept open in convenient form for public inspection and examination during reasonable business hours. [52 Stat. 830 (1938); 15 U.S.C. § 717o]

Rehearing; Court Review Of Orders

Sec. 19. (a) Any person, State, municipality, or State commission aggrieved by an order issued by the Commission in a proceeding under this act to which such

person, State, municipality, or State commission is a party may apply for a rehearing within thirty days after the issuance of such order. The application for rehearing shall set forth specifically the ground or grounds upon which such application is based. Upon such application the Commission shall have power to grant or deny rehearing or to abrogate or modify its order without further hearing. Unless the Commission acts upon the application for rehearing within thirty days after it is filed, such application may be deemed to have been denied. No proceeding to review any order of the Commission shall be brought by any person unless such person shall have made application to the Commission for a rehearing thereon. Until the record in a proceeding shall have been filed in a court of appeals, as provided in subsection (b), the Commission may at any time, upon reasonable notice and in such manner as it shall deem proper, modify or set aside, in whole or in part, any finding or order made or issued by it under the provisions of this Act.

(b) Any party to a proceeding under this act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. A copy of such petition shall

forthwith be transmitted by the clerk of the court to any member of the Commission and thereupon the Commission shall file with the court the record upon which the order complained of was entered, as provided in section 2112 of title 28, United States Code. Upon the filing of such petition such court shall have jurisdiction, which upon the filing of the record with it shall be exclusive, to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of

the United States upon certiorari or certification as provided in [former] sections 239 and 240 of the Judicial Code, as amended (U.S.C., title 28, sec. 1254).

(c) The filing of an application for rehearing under subsection (a) shall not, unless specifically ordered by the Commission, operate as a stay of the Commission's order. The commencement of proceedings under subsection (b) of this section shall not, unless specifically ordered by the court, operate as a stay of the Commission's order. [52 Stat. 831 (1938); 15 U.S.C. § 717r]

No. 1293

PEOPLE OF THE STATE OF CALIFORNIA and PUBLIC UTILITIES COMMISSION OF THE STATE OF CALIFORNIA, *Petitioners,*

vs.

SKELLY OIL COMPANY, et al., *Respondents.*

Motion for Leave to File Supplement to Petition for a Writ of Certiorari to the United States Court of Appeals for the Tenth Circuit

The petitioners in the above-entitled proceeding, the People of the State of California and the Public Utilities Commission of the State of California, pursuant to Rule 35 of the Revised Rules of the Supreme Court of the United States, respectfully move for leave to file this Supplement to their Petition for a Writ of Certiorari to the United States Court of Appeals for the Tenth Circuit. Said Petition for a Writ of Certiorari was filed in this Court on April 19, 1967, Docket No. 1293, October Term, 1966.

This motion is necessitated by the action of the Court of Appeals. Petitioners stated at pages 2 and 3 of their Petition for a Writ of Certiorari that several petitions for

rehearing were pending in the court below. (Between March 6 and March 10, 1967, petitions for rehearing were filed by the following respondents:

Shell Oil Company and Phillips Petroleum Company in Docket Nos. 8409 and 8489;

Warren Petroleum Corporation, Gulf Oil Corporation, The British-American Oil Producing Company, Humble Oil & Refining Company, Cities Service Oil Company, Cities Service Production Company, Coltexo Corporation, Columbian Fuel Corporation, and Columbian Carbon Company in Docket Nos. 8440, 8493, 8534, 8497, 8488, 8493, and 8517;

Standard Oil Company of Texas in Docket No. 8479;

Mobil Oil Corporation (formerly Socony Mobil Oil Co., Inc.) and Northern Natural Gas Producing Company in Docket Nos. 8455, 8460, and 8588;

Pan American Petroleum Corporation and Sinclair Oil & Gas Company in Docket Nos. 8458 and 8493;

Texaco Inc., Amerada Petroleum Corporation, Atlantic Richfield Company, Southland Royalty Company, Westates Petroleum Company, Dorchester Gas Producing Company, Sunray DX Oil Company, Marathon Oil Company, Sohio Petroleum Company, and Tidewater Oil Company in Docket Nos. 8482, 8541, 8493, 8542, 8490, 8540, and 8494.)

On April 18, 1967, the Court of Appeals granted these petitions for rehearing and issued its Per Curiam Opinion and Order on Rehearing. The Court of Appeals reversed its original opinion on two important matters. The object of this motion is to provide this Court with a printed copy of the Per Curiam Opinion and Order on Rehearing, and to present petitioners' additional questions for review which result from said Opinion and Order on Rehearing, and to state their reasons, with respect to such additional questions, for granting their petition for a writ of certiorari.

The Per Curiam Opinion and Order on Rehearing of the court below adversely affects petitioners respecting whether the Federal Power Commission may prospectively constitute its determined just and reasonable area rates as the initial price for certification of subsequent sales in the area under Section 7 of the Natural Gas Act, and respecting whether the Federal Power Commission may require in an area rate proceeding refunds of rates collected subject to refund under Section 4 of the Act on a rate schedule-by-rate schedule basis. Petitioners submit that the Per Curiam Opinion and Order on Rehearing is erroneous and unlawful, and that it raises additional questions of law which should be reviewed by this Court.

Therefore, petitioners respectfully pray that this motion be granted in order that said Per Curiam Opinion and Order on Rehearing and petitioners' objections to it may be added to petitioners' petition for a writ of certiorari.

Respectfully submitted,

No. 1293

PEOPLE OF THE STATE OF CALIFORNIA and PUBLIC UTILITIES COMMISSION OF THE STATE OF CALIFORNIA,
Petitioners,

vs.

SKELLY OIL COMPANY, *et al.*,
Respondents.

Supplement to Petition for a Writ of Certiorari to the United States Court of Appeals for the Tenth Circuit

INTRODUCTORY STATEMENT

As indicated at pages 2 and 3 of their Petition for a Writ of Certiorari to the United States Court of Appeals for the Tenth Circuit,[1] petitioners, People of the State of California and Public Utilities Commission of the State of California (California), advised this Court that certain

1. Filed in this Court on April 19, 1967, Docket No. 1293, October Term, 1966.

respondents had filed petitions for rehearing before the Court of Appeals and that this Court would be advised of the determination of these petitions by the Court of Appeals as soon as possible.

The judgment of the Court of Appeals entered on January 20, 1967, is printed in Supplemental Appendix A.

On April 18, 1967, the Court of Appeals issued a *per curiam* opinion and order on rehearing which is not as yet reported. This *per curiam* opinion and order on rehearing is printed as Supplemental Appendix B.

ADDITIONAL QUESTIONS PRESENTED

1. Where the Federal Power Commission has determined just and reasonable area rates under Sections 4 and 5 of the Natural Gas Act, may the Commission find that such area rates prospectively constitute the initial price for certificating sales in the area under Section 7 of the Act?[2]

2. Where the Federal Power Commission has determined just and reasonable area rates, must area revenues exceed the allowable area cost of service before refunds of contract rates collected subject to refund under Section 4 of the Act may be ordered?

ADDITIONAL STATUTE INVOLVED

Due to the Court of Appeals' *per curiam* opinion and order on rehearing, which involves certificate applications under Section 7 of the Natural Gas Act, petitioners hereby set forth the provisions of Section 7, 15 U.S.C. Section 717f, in Supplemental Appendix C.

---

2. Although the court below did not decide this question inasmuch as it remanded the case for further proceeding before the Commission with respect to the validity of the area rates, petitioners take the position that such area rates are valid and, therefore, urge this Court, if it concludes that such rates are valid, to decide this question at this time.

ADDITIONAL STATEMENT OF THE CASE

The Court of Appeals' *per curiam* opinion and order on rehearing apparently remands the Federal Power Commission's (Commission) certificate order (J.A. 827d-838d) issued concurrently with Opinion No. 468. The concurrent certificate order concerned four separate applications under Section 7 of the Natural Gas Act for certificates of public convenience and necessity to sell gas produced in the area.[3] These applications were consolidated with the area rate proceeding and in the meantime temporary certificates were granted to all four applicants. By its concurrent certificate order the Commission granted permanent certificates to these applicants, but it conditioned them to an initial price no higher than the applicable area rates. Upon petition for rehearing by one of the applicants, Texaco Inc., in Docket No. CI61-879, the Court of Appeals in its *per curiam* opinion has remanded the concurrent certificate order in the Texaco Inc. matter, Docket No. CI61-879. The court probably intended its opinion and order to incluude remand of the Commission's entire certificate order. In any event, the lower court expressly declined to either approve or disapprove the Commission's action to constitute the area rates determined under Sections 4 and 5 of the Act to be the initial price required by public convenience and necessity in certificate applications under Section 7. By its action the court refused to approve the position adopted by the Commission.

Furthermore, the Court of Appeals' *per curiam* opinion and order reverses its original decision with regard to refunds of rates collected subject to refund under Section 4(e)

---

3. The four applications consolidated are: North Central Oil Corporation (Operator), *et al.*, Docket No. CI60-435; Socony Mobil Oil Company, Inc., Docket No. CI61-34; Robert T. Brown (Operator), *et al.*, Docket No. CI61-733; Texaco Inc., Docket No. CI61-879.

of the Act. The court below now adopts the position of the producers and holds that refunds on a rate schedule-by-rate schedule basis would be inconsistent with its conclusion that in an area rate proceeding group revenues must equal the group revenue requirement. Therefore, the court prohibits any refunds when there is a group revenue deficiency. The court directs that refunds may be ordered "on some equitable contract-by-contract basis" when group revenues exceed the group revenue requirements. In its change of position on this matter the court withdraws its reliance upon *Federal Power Commission v. Tennessee Gas Transmission Company*, 371 U.S. 145 (1962), and relies upon *Second Phillips*.[4]

ADDITIONAL REASONS FOR GRANTING THE WRIT

A. The Court Below Has Reversed the Commission's Concurrent Certificate Order Without Giving Any Reasons

The Court of Appeals has remanded the Commission's concurrent certificate order on the ground that since this order establishes the area rate, which the court has reversed and remanded, as the proper initial contract price to be permitted in the consolidated certificate proceedings, the certificate order also must be remanded.

California submits that this action reverses the Commission's determination in Opinion No. 468 that the just and reasonable area rates would constitute the intitial certificate price, less possible quality deductions, in subsequent Section 7 proceedings. After stating in the certificate order that the only issue involved is the level at which the initial price should be set, the Commission relies on its determination in Opinion No. 468 (J.A. 668d) to prescribe the area

4. *Wisconsin v. Federal Power Commission*, 373 U.S. 294 (1963).

rates as the proper initial price in subsequent certificate proceedings. (J.A. 827d-828d.) Despite the court's disclaimer that it has not spoken on the question whether the area rates may be constituted as initial certificate prices, the result of the court's action is to reverse the Commission's determination on this question without giving any reasons. The court has actually decided this question adversely to the Commission. California submits that the court should have affirmed the Commission's determination even though the correct figure for the initial price would not be known due to the remand of its area rate determination.

The court's action in reversing the Commission's determination on this issue without any discussion can only result in further delay in the development of area rate making. Such action is contrary to the primary purpose of the Act, which is to protect consumers. *Atlantic Refining Company, et al. v. Public Service Commission of New York,* 360 U.S. 378 (1959). If the position of the court below prevails, its opinion on this issue would be required before further judicial review would be possible. California submits that this issue is properly before this Court in that the Commission expressed its view on it in Opinion No. 468 and in its concurrent certificate order. California urges that this Court review this issue and affirm the Commission's determination.

B. The Reversal by the Court Below of Its Original Position on the Refund Question Is Erroneous

The court below has completely reversed itself on the question of the proper basis for refunds in an area rate proceeding. The court originally said that it "saw no escape that refunds be on an individual company basis and on a schedule by schedule basis" and that if confiscation would result or the public interest would be harmed by any refund

obligation the answer was an adequate special relief provision (App. A to the Petition, p. 426-27). Now the court says that refunds must be made on an industry area wide basis, thereby permitting refunds only if group area revenues exceed group area revenue requirements.

California submits that the lower court's new position is unlawful. The court's conclusion that *Federal Power Commission v. Tennessee Gas Transmission Company,* 371 U.S. 145 (1962), is no longer applicable because it dealt with zone rates is grossly inaccurate. That case announced fundamental and permanent principles regarding refunds under Section 4(e) of the Natural Gas Act, and it cannot be brushed aside on its facts. 371 U.S. 145, 152-3. The lower court would permit individual producers who have assumed the hazards involved in the Section 4 procedure to retain any illegal gain (i.e., that portion of rates which exceed the Commission's just and reasonable area rates and which were collected subject to refund) in the name of balancing group revenues with group revenue requirements. Such a result leaves producers in the best of all worlds—refund determinations made on a group basis and special relief determined on an individual basis. In addition, such a result is contrary to this Court's firm statement that regulation does not guarantee a profit. *Federal Power Commission v. Natural Gas Pipeline Company,* 315 U.S. 575, 590 (1942). It also violates this Court's decision in *Hope*[5] by permitting an end result totally unfair to consumers.

Likewise, the lower court's reliance upon *Second Phillips* to justify its change of position is misplaced. The Commission decision in that case did not hold that increased rates collected subject to refund, which were higher than the subsequently determined just and reasonable rate, cannot

5. *Federal Power Commission v. Hope Natural Gas Company,* 320 U.S. 591 (1944).

be refunded because company overall costs exceed revenues for the test year. This Court expressly recognized in *Second Phillips* that the Commission had not made any determination of just and reasonable rates for the company because the Commission had found the individual company cost-of-service method was not adequate for producers. 373 U.S. 294, 306 n. 15. This Court approved the Commission's termination of a limited number of consolidated rate increase proceedings for locked-in periods on the ground that it was not worth the time and cost to determine reasonable rates for certain past periods, and then determine the refunds required.

CONCLUSION

For the reasons stated above, petitioners submit that the *per curiam* opinion and order of the Court of Appeals is erroneous, and petitioners respectfully pray that a petition for a writ of certiorari issue to the Court of Appeals for the Tenth Circuit.

JUDGMENT*

Thirteenth Day, January Term,
Friday, January 20th, 1967.

Before Honorable David T. Lewis,
Honorable Jean S. Breitenstein and
Honorable Delmas C. Hill,
Circuit Judges.

No. 8385

SKELLY OIL COMPANY,
Petitioner,

v.

FEDERAL POWER COMMISSION,
Respondent.

ON PETITION TO REVIEW AN ORDER OF THE FEDERAL POWER COMMISSION

This cause came on to be heard on petition to review an order of the Federal Power Commission and motion to adduce additional evidence and was argued by counsel.

On consideration whereof, it is ordered by this court that the motion to adduce additional evidence is hereby denied. The petition to review is granted and the case is remanded to the Commission for further proceedings consistent with the opinion of the court.

*An identical judgment was entered in each of the thirty-two docketed proceedings in the Court of Appeals.

Supplemental Appendix B

UNITED STATES COURT OF APPEALS TENTH CIRCUIT

Nos. 8385 etc., March Term, 1967

Filed—United States Court of Appeals Tenth Circuit
Apr 18 1967
William L. Whittaker, Clerk

SKELLY OIL COMPANY, et al.,
Petitioners,

v.

FEDERAL POWER COMMISSION,
Respondent.

ON REHEARING.

PER CURIAM.

Texaco Inc. asserts that the opinion is not clear as to the disposition of its Docket No. C161-879 [*sic*] in which, by an order separate and apart from Opinions Nos. 468 and 468-A and their accompanying orders, a § 7 certificate was issued at a rate of 14.5 cents less quality deductions. This separate order shows that the Commission treated the area rate as the in-line rate for § 7 certificates.

The order on this docket was lost in the mass of material presented to us. No party made a point of it. We have reconsidered the Texaco petition for review and have concluded that it is sufficiently broad to cover such order. It should receive the same treatment as the § 4 and § 5 pro-

ceedings. Accordingly, the remand includes the separate order entered in Docket No. C161-879 [*sic*].

We note that in its disposition of this particular docket the Commission took the position that an established area rate automatically becomes the in-line rate for a § 7 proceeding. The same position was taken by the Commission in its Opinion No. 484 which we are today reversing by our decision in Nos. 8723 etc.—Phillips Petroleum Company, et al., v. Federal Power Commission, ... F.2d ..... We there hold that in a § 7 application heard by the Commission after its Permian decision the adoption of the area rate as an in-line rate must fall because we have rejected the area rate. We do not there, and we do not here, express either approval or disapproval of the principle that an area rate established in a § 5 proceeding automatically becomes an in-line rate for a § 7 proceeding. The validity of such a principle may be affected by the final determination of the validity of the Permian Basin area rate.

Various producers insist that we erred in our treatment of refunds. We held that refunds must be on a company-by-company and schedule-by-schedule basis. We are now convinced that such holding was wrong and is inconsistent with our conclusion that satisfaction of the end result test requires rates which will equate group revenues with group revenue requirements.

The refunds in question relate to collections made during the so-called "locked-in" periods, i.e., the periods during which an increased rate, later superseded by a further increase, is effective. See Second Phillips, 373 U.S. 294, 298, fn. 5. In that case the Court said that on the locked-in rate issue "the sole question was whether all or any part of the increases had to be refunded by Phillips." The Court pointed out that the Commission decided that the increases

did not bring revenues up to cost of service, and held that the Commission "properly concluded" that "no refund obligations could be imposed." *Id.* at 306.

We are now convinced that this treatment of refund obligations for locked-in rates in the case of an individual company in Second Phillips must be applied on a group basis when an area rate is fixed and tested by the end result. We are also convinced that our reliance on Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, was misplaced. That case dealt with zone rates. The Second Phillips decision on locked-in rates came later.

This modification of the opinion means that no refund obligation may be imposed for a period in which there is a group revenue deficiency. When group revenues exceed group revenue requirements, refunds may be ordered on some equitable contract-by-contract basis. In fixing an area rate, the Commission must consider the effect which past and potential refunds have on the balancing of group revenues with group revenue requirements.

In all respects, except those specifically noted herein, the petitions for rehearing are severally denied.

Supplemental Appendix C

Section 7 of the Natural Gas Act

Construction, extension, or abandonment of facilities; certificate of convenience and necessity; condemnation proceedings

SEC. 7. (a) Whenever the Commission, after notice and opportunity for hearing, finds such action necessary or desirable in the public interest, it may by order direct a natural-gas company to extend or improve its transportation facilities, to establish physical connection of its transportation facilities with the facilities of, and sell natural gas to, any person or municipality engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public, and for such purpose to extend its transportation facilities to communities immediately adjacent to such facilities or to territory served by such natural-gas company, if the Commission finds that no undue burden will be placed upon such natural-gas company thereby: *Provided,* That the Commission shall have no authority to compel the enlargement of transportation facilities for such purposes, or to compel such natural-gas company to establish physical connection or sell natural gas when to do so would impair its ability to render adequate service to its customers.

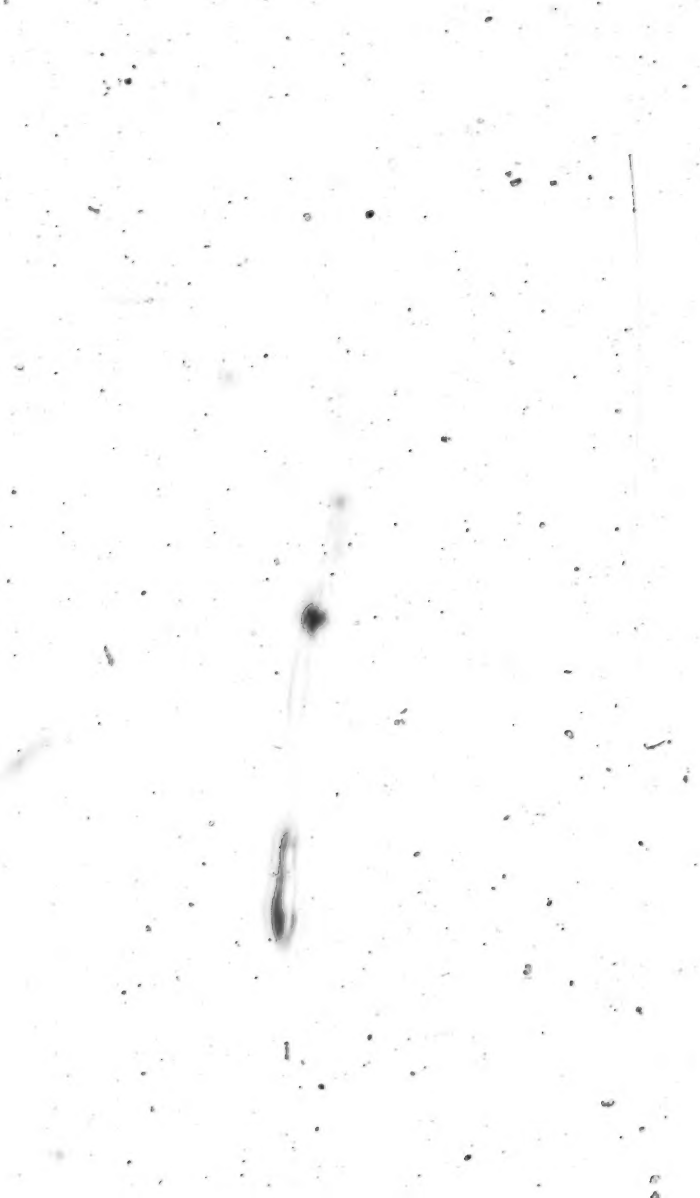
(b) No natural-gas company shall abandon all or any portion of its facilities subject to the jurisdiction of the Commission, or any service rendered by means of such facilities, without the permission and approval of the Commission first had and obtained, after due hearing, and a finding by the Commission that the available supply of natural gas is depleted to the extent that the continuance of service is unwarranted, or that the present or future public convenience or necessity permit such abandonment.

(c) No natural-gas company or person which will be a natural-gas company upon completion of any proposed construction or extension shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission, or undertake the construction or extension of any facilities therefor, or acquire or operate any such facilities or extensions thereof, unless there is in force with respect to such natural-gas company a certificate of public convenience and necessity issued by the Commission authorizing such acts or operations: *Provided, however,* That if any such natural-gas company or predecessor in interest was bona fide engaged in transportation or sale of natural gas, subject to the jurisdiction of the Commission, on February 7, 1942, over the route or routes or within the area for which application is made and has so operated since that time, the Commission shall issue such certificate without requiring further proof that public convenience and necessity will be served by such operation, and without further proceedings, if application for such certificate is made to the Commission within ninety days after February 7, 1942. Pending the determination of any such application, the continuance of such operation shall be lawful.

In all other cases the Commission shall set the matter for hearing and shall give such reasonable notice of the hearing thereon to all interested persons as in its judgment may be necessary under rules and regulations to be prescribed by the Commission; and the application shall be decided in accordance with the procedure provided in subsection (e) of this section and such certificate shall be issued or denied accordingly: *Provided, however,* That the Commission may issue a temporary certificate in cases of emergency, to assure maintenance of adequate service or to serve particular customers, without notice or hearing,

pending the determination of an application for a certificate, and may by regulation exempt from the requirements of this section temporary acts or operations for which the issuance of a certificate will not be required in the public interest.

(d) Application for certificates shall be made in writing to the Commission, be verified under oath, and shall be in such form, contain such information, and notice thereof shall be served upon such interested parties and in such manner as the Commission shall, by regulation, require.



(e) Except in the cases governed by the provisos contained in subsection (c) of this section, a certificate shall be issued to any qualified applicant therefor, authorizing the whole or any part of the operation, sale, service, construction, extension, or acquisition covered by the application, if it is found that the applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of this chapter and the requirements, rules, and regulations of the Commission thereunder, and that the proposed service, sale, operation, construction, extension, or acquisition, to the extent authorized by the certificate, is or will be required by the present or future public convenience and necessity; otherwise such application shall be denied. The Commission shall have the power to attach to the issuance of the certificate and to the exercise of the rights granted thereunder such reasonable terms and conditions as the public convenience and necessity may require.

(f) The Commission, after a hearing had upon its own motion or upon application, may determine the service area to which each authorization under this section is to be limited. Within such service area as determined by the Commission a natural-gas company may enlarge or extend

its facilities for the purpose of supplying increased market demands in such service area without further authorization.

(g) Nothing contained in this section shall be construed as a limitation upon the power of the Commission to grant certificates of public convenience and necessity for service of an area already being served by another natural-gas company.

(h) When any holder of a certificate of public convenience and necessity cannot acquire by contract, or is unable to agree with the owner of property to the compensation to be paid for, the necessary right-of-way to construct, operate and maintain a pipe line or pipe lines for the transportation of natural gas, and the necessary land or other property, in addition to right-of-way, for the location of compressor stations, pressure apparatus, or other stations or equipment necessary to the proper operation of such pipe line or pipe lines, it may acquire the same by the exercise of the right of eminent domain in the district court of the United States for the district in which such property may be located, or in the State courts. The practice and procedure in any action or proceeding for that purpose in the district court of the United States shall conform as nearly as may be with the practice and procedure in similar action or proceeding in the courts of the State where the property is situated: *Provided,* That the United States district courts shall only have jurisdiction of cases when the amount claimed by the owner of the property to be condemned exceeds $3,000. [52 Stat. 824 (1938); 15 U.S.C. § 717f, as amended.]

ON PETITIONS FOR WRITS OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

BRIEF FOR RESPONDENTS IN OPPOSITION

Questions Presented

The Court of Appeals found that an area rate order of the Federal Power Commission did not contain findings which the court deemed essential to enable it to determine whether the order was valid under the end result test. The court, while approving much of the order, remanded it to enable the Commission to make the required determinations and to complete the administrative task so that judicial review could be meaningfully undertaken. The questions thus presented are:

1. Whether the court below erred in remanding for completion of the administrative process an area rate order of the Federal Power Commission in which the Commission conceded that it had not determined, and on the record could not have determined, that the area ceiling rates established by it as just and reasonable for area producers as a group would afford such producer group the opportunity to

recover its revenue requirements as those requirements were found by the Commission.

2. Whether the court erred in concluding that in an area rate proceeding the Commission may not lawfully order refunds unless, during some portion of the "locked-in" period, the revenues of the area producers as a group exceed the revenue requirements of such producer group as those requirements were determined by the Commission.

Argument

The landmark nature of this first area rate case is likely to give the luster of plausibility to any petition for certiorari dealing with it. The general significance of the matter should not, however, overshadow the necessity for completion of the administrative process before plenary consideration is undertaken by this Court. Forbearance at this time will, we believe, result in ultimate expedition.

As to the questions presented by the four petitions to which this opposition relates, the court below, consistent with applicable and well-embedded regulatory principles established by this Court, has merely laid bare the manifest error of the Commission in not completing its administrative task, and thereupon properly remanded the Commission's order to enable the Commission to rectify the deficiency. The court has thus done that which, had it failed to do so, we feel this Court would have felt compelled to do. Consequently, the Court of Appeals has not "decided an important question of federal law which has not been, but should be settled by this court" nor has it "decided a federal question in a way in conflict with applicable decisions of this court."*

1. On the revenue-revenue requirement issue the essence of the court's conclusion was that the commission's order was not ripe for meaningful judicial testing in light

* Rule 19(1)(b), Revised Rules of Supreme Court.

of applicable regulatory principles. By its own admission (Cal. App. 357) * the Commission had not considered or determined and, indeed, from the record could not have determined, whether the area ceiling rates established by it would afford the regulated entity the opportunity to recover its revenue needs as the Commission itself found those needs to be. The Commission was unconcerned with —and from the evidence of record could not have reasonably apprised itself of—the impact which its rates would have on the regulated entity. The court was therefore confronted with a rate order which neither considered nor contained a finding relating to an aspect of rate making which was essential to enable it to ascertain whether the order was just and reasonable in its consequences.

With the case in that posture at the review level, the Court of Appeals, unless it was to override legal doctrine long established by this Court, was left with no choice but to conclude that the Commission must come forth with record-supported finding on one of the most crucial aspects of this case. To give itself something to review in light of the end result test, and with careful observance of the administrative function, the court remanded the order.

Any other action by the court would have constituted an abdication of its judicial responsibility. If the Commission is at liberty to ignore the revenue deficit which will result from its rate order, or if the Commission is free to protect its rate orders from judicial scrutiny by the mere assertion —untested and not supportable on the record—that the rates strike a "fair relationship" between aggregate prices to consumers and aggregate costs to producers, then judicial review is meaningless. The judicial review function would thereupon be that of merely stamping approval to every rate order issued by rate making agencies.

The Court of Appeals actually accorded more than due deference to the administrative order in this case. The Commission *said* that its ceiling rates would bring about a "fair relationship" between aggregate prices to consumers

* "Cal. App." refers to the Appendix filed with its petition in this Court by the State of California in No. 1293.

and aggregate costs to producers (J.A. 548d). But the Commission made no findings on the basis of the record as to how this "fair relationship" came about. Nor would the record have supported any such finding. The court, on the basis of the record, could have properly concluded that the rates designed by the Commission would not produce a fair relationship between aggregate consumer prices and aggregate producer costs.* Nonetheless, with more

---

* The record clearly shows that the Commission's ceiling rates will not provide a fair relationship between aggregate prices paid by consumers and aggregate costs incurred by prolucers. The record reflects the following for the year 1960, the "test year" used in this proceeding:

COST-REVENUE RELATIONSHIPS—1960 (*Flowing Gas*)

Industry's unit cost as found by Commission	14.39	cents per Mcf (Cal. App. 126)
Industry's unit revenue at contract prices including increases	12.72	cents per Mcf (J.A. 538e)
Industry's unit revenue deficiency	1.67	cents per Mcf
On a total dollar basis the figures are:		
Producers' test year aggregate costs	$123.9	million (Cal. App. 126; Exh. 175, Sch. 1, J.A. 538e)
Producers' aggregate test year revenues —	$109.5	million (Exh. 118, Sch. 3, J.A. 291e)
Producers' test year total dollar revenue deficiency	$14.4	million

The foregoing revenue deficiency of more than $14 million will be substantially increased by virtue of the quality deductions imposed by the Commission. While there is no record evidence to indicate the extent of these quality deductions, in its 1966 Annual Report to Congress (released after the initial decision of the court below) the Commission states that the quality adjustments will result in reductions of Permian Basin producers' prices of approximately $8 million *per year* (Federal Power Commission 1966 Annual Report, p. 131). That, again, is but a post-decision estimate.

than due deference to the administrative process, and because of the unascertainable impact of the quality deductions, the court merely remanded the Commission's order to enable it to complete the performance of its duty.

The Commission admits that it did not determine whether its *ceiling* rates, which it fixed at the same unit figure as that which it found to be the industry's *average* unit revenue requirement, would enable the industry to recover that revenue requirement (J.A. 1114(d)). In this regard, the court observed (Cal. App. 413):

> "The Commission concedes that it did not equate jurisdictional costs to jurisdictional revenues. This is obvious because no determination was made of the jurisdictional revenues which the rates will produce."

No court, we suggest, can meaningfully review a rate order when the regulatory agency does not, and upon the basis of the record cannot, determine what revenues will be forthcoming from the ceiling rates established by the order. How, in the absence of such determination, can any court realistically evaluate whether such rate order is "unjust and unreasonable in its consequences" (*F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591, 603 (1944)); or evaluate the "impact of the rate order" (*id.*, p. 602)? The court below found itself unable to do so and hence correctly remanded the order to enable the Commission to complete its required task.*

---

* The Examiner concluded that: "Rate design is concerned with insuring that producers as a group have a practical opportunity to realize the revenue standard under their contracts and with the distribution of that total amount among the various contracts" (J.A. 244d). The Commission rejected this conclusion of the Examiner.

It is also noteworthy that in the Southern Louisiana Area Rate Proceeding, AR61-2, pending before the Commission on exceptions to the Examiner's decision, a large number of gas distributors who

The instant petitions, although each may express the issue somewhat differently, are all based principally upon the premise that the Commission was not required to concern itself with the revenues which area producers would receive under its ceiling rates, or whether such revenues would be in substantial balance with revenue needs. The principal basis for the instant petitions for certiorari is that the Commission had no obligation to design rates which would afford area producers the opportunity to recover their revenue requirements which the Commission itself determined to be appropriate for them; and that the court's review function came to a halt merely because the Commission *said* its rates resulted in a fair relationship between consumer prices and producer costs. Thus the petitioners urge this Court to review this case in the light of an obviously deficient administrative order which must be rectified before even the Court of Appeals can properly exercise its review function.

As heretofore stated, the Commission fixed the *ceiling* price for flowing gas at the *average* unit revenue requirement which, in turn, was arrived at essentially on the basis of the *average* historical unit cost of gas-well gas. The

---

are participants under the name of Associated Gas Distributors, take the following position in their brief filed with the Commission:

> "Unlike *Permian,* the impact of a commission rate order can be determined on this record, and we contend that it should be considered in fixing rates." Brief of Associated Gas Distributors Opposing Exceptions, AR61-2, page 103, fn. 121.

And:

> "We have urged before . . . that in Southern Louisiana a matching of costs and revenues can and should be made." (*Id.,* page 124.)

Thus, in the second area rate proceeding a large group of distributors are urging that the Commission should do that which the instant petitioners contend the court below erred in requiring the Commission to do here. Those distributors also concede that the record in this (*Permian*) proceeding does not permit determination of the impact of the Commission's rate order.

average unit cost was found to be 14.39 cents per Mcf which was rounded off to 14.5 cents per Mcf as the ceiling price for flowing gas.* Existing prices above the ceiling were reduced to the ceiling, but prices below the ceiling were not increased to it.* Additionally, the Commission limited the ceiling price entitlement to only that gas meeting its criterion of "pipeline quality". It then required substantial but undetermined reductions from such ceiling prices for gas failing to meet its "pipeline quality" standard. Since, as found by the Commission, much of the gas involved is not of "pipeline quality"** and would, therefore, be subject to reductions below the ceiling, the industry's revenue will necessarily fall further substantially below its revenue requirements as determined by the Commission.*** The Commission does not deny the deficiency in

---

* The same principle, but with different figures, was applied to "new" gas.

* Petitioners contend that the court below ordered the Commission to increase contract prices. As shown *infra*, page 12, that is not so. We have never contended, either before the Commission or the court below, that contract prices should be *increased*. We have only contended that, absent a valid finding that existing prices are unjust and unreasonable, they cannot lawfully be *reduced*.

** The court below found that "[a]bout 90% of the flowing gas is substandard" (Cal. App. 420).

*** The Commission's lack of concern with balancing industry revenues with revenue requirements in this case should be contrasted with the goal of area ratemaking as presented to this Court in *Wisconsin* v. *F.P.C.*, 373 U.S. 294 (1963), (sometimes referred to as *Second Phillips*), wherein the Court observed (309-310):

> "The Commission has stated in its opinion in this proceeding that the goal is to have rates based on the 'reasonable financial requirements of the industry' in each production area, 24 FPC, at 547, and we were advised at oral argument that composite cost-of-service data will be considered in the area rate proceedings."

revenues. Rather, it asserts the lack of any obligations to concern itself with the deficiency. In fact, the Commission considered that it is under no obligation even to ascertain the amount of such deficiency, and on this record it was impossible to determine the impact of the quality deductions. As the court observed, the controlling question of whether the revenue requirements of the area producers as a group can be satisfied by the rates designed by the Commission "cannot be answered because the financial impact of the quality deductions is not ascertainable from the record" (Cal. App. 425-426).

This Court has held that in enacting the Natural Gas Act, Congress was not only concerned with protection of consumers from excessive prices for natural gas, but Congress

> ". . . was also manifesting its concern for the legitimate interests of natural gas companies in whose financial stability the gas-consuming public has a vital stake. Business reality demands that natural gas companies should not be precluded by law from increasing the prices of their product whenever that is the economically necessary means of keeping the intake and outgo of their revenues in proper balance. . . ." *United Gas Pipe Line Co. v. Memphis Light, Gas & Water Division*, 358 U.S. 103, 113 (1958).

Since the Natural Gas Act enables natural gas companies to *increase* their rates when that is necessary to keep revenue intake and outgo in proper balance, it seems indisputable that the Act did not empower the Commission to reduce existing gas prices without knowledge of or regard for the consequences of such action upon the financial integrity of natural gas companies.

Viewed in the light that the Commission violated a basic regulatory principle and stopped short of completing the administrative task, it is apparent that the issues raised

in these petitions are premature. The court below has upheld the Commission on every issue of method of area rate regulation and on many other major aspects of its ruling.* The court, in substance, has merely held that the Commission had not completed its regulatory task and that its order could not be properly reviewed until that was accomplished. Arguments of the petitioners with respect to "fair relationship" as opposed to "end result" are only variations of arguments that the Commission need not know the ultimate effect of its rate order.

Similarly, arguments that the Commission's ceiling prices do not constitute average costs; that some costs are in fact less than determined by the Commission; and that the Commission properly dealt with the quality problem

---

* In a public address by the Chairman of the Commission, he stated:

> "We have been encouraged by the substantial affirmation of the area rate approach by the Court of Appeals for the Tenth Circuit. In its decision, that Court squarely approved the group ratemaking approach and approved as well most of our applications of the concept, including the two-price system and the moratorium. Though the Court thought it necessary to remand the case to the Commission for further work on some points, the Commission intends to appeal for an early hearing in the Supreme Court to avoid the inevitable delay inherent in bringing the case back for further deliberations at this time, and then sending it back up the judicial ladder." (An Address by Lee C. White, Chairman, Federal Power Commission, Before the Texas Independent Producers and Royalty Owners Association, Austin, Texas, April 17, 1967, page 4.)

We do not agree with the Chairman that completion of the administrative function prior to this Court's review will cause delay. This case should not reach the top of the "judicial ladder" until the Commission has completed the required "further work on some points" to put the case in a properly reviewable posture.

in the rate of return,* do not now present matters requiring consideration by this Court. Congress has entrusted the review of such matters to the Courts of Appeals, and it is for those courts to determine in the first instance whether such claims are valid. In this instance the Commission has failed to make the findings which are essential to permit the lower court to perform its assigned review function. *Florida* v. *United States*, 282 U.S. 194, 215 (1931); *S.E.C.* v. *Chenery Corp.*, 318 U.S. 80 (1943); *Colorado-Wyoming Gas Co.* v. *F.P.C.*, 324 U.S. 626, 634 (1945); *Burlington Truck Lines* v. *United States*, 371 U.S. 156, 167-168 (1962).

The court below has performed its review function in the only way it could on the record presented, by directing the Commission to complete its regulatory assignment in order that the court could in turn fulfill its function. In answer to the various defenses raised by the Commission, the court concluded (Cal. App. 429-430):

> "We have accepted the Commission's conclusion that contract rates should not be used. The trouble is that the Commission decision rides two horses and we have no way of knowing the outcome of the race. It uses composite cost-of-service evidence, engrafts economic factors on top, and comes out with a rate which it justifies on a fair relationship basis. We have the problem of how in such circumstances a court can determine whether the just and reasonable standard of §§ 4 and 5 has been met. The answer is not found in the record before us.

---

* The first question presented in the Government's petition implies that the court below found the rate of return fixed by the Commission to be inadequate. The court made no such determination. The court did question the propriety of including an ascertainable cost, *i.e.*, what it would cost to bring Permian gas up to pipeline quality, as a risk, and attempting as the Commission did to compensate therefor by some unascertainable portion of the rate of return. The court said (Cal. App. 422):

> "The fact is that by treating quality deductions as a risk rather than a cost the Commission has made it impossible to determine the amount of return with any degree of certainty."

> "The facts sustaining the conclusion of fair relationship must be found. The Commission did not make those findings and indeed it could not have done so because of the failure of the record to disclose the revenue impact of the adjustments in area rates to reflect quality differentials."

The Government's first question presented inquiries whether the Commission erred in treating quality deductions as a risk rather than a cost.* No matter the answer to that question, the case has to go back to the Commission to complete its task and to put the Commission's order in a reviewable posture, because, as the Court of Appeals found (Cal. App. 430):

> "... Whether rate reductions because of quality deficiencies are a risk or a cost, the answer comes out the same. If they are a risk, we do not know the rate of return. If they are a cost, we do not know whether the revenue received will equal the reasonable revenue requirements. We believe that under Hope, and under Second Phillips, the area producers, as a group, are entitled to recover their prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. Satisfaction of this requirement must appear through appropriate findings based on substantial evidence. These cannot be made on the record presented."

---

* The Commission determined the cost of finding and producing a *random* unit of gas at the wellhead, without regard to the quality, pressure or Btu content of the gas. Without including in the industry's cost anything for bringing random gas up to its rigid quality and pressure specifications, the Commission, after fixing ceiling rates at the *average* cost of *random* gas and without determining the cost of bringing substandard gas up to pipeline quality, imposed reductions from the ceiling for substandard gas. The Court of Appeals was therefore understandably concerned with such treatment of the quality problem question by the Commission. But for present purposes, as hereafter indicated above, this question need not now be faced by this Court. Whether the quality deduction be treated as a risk or a cost, neither the Commission nor the Court of Appeals could ascertain on this record the impact thereof.

The arguments in the petitions that the court required the Commission to raise existing contract rates simply misconstrue what the court did. The court fully recognizes the doctrine established by this Court in *Mobile* * and *Sierra.*** The court's conclusion was that it could not determine—nor did the Commission itself determine—whether the minimum and maximum rates established by the Commission would afford the regulated entity the opportunity to recover its revenue requirements as determined for it by the Commission. The court puts this issue in proper focus by saying (Cal. App. 425-426):

> "We believe that the controlling question is whether the proper revenue requirements of the area producers as a group can be satisfied with rates having the ceiling and the floor which the Commission has fixed. This cannot be answered because the financial impact of the quality deductions is not ascertainable from the record."

2. On rehearing the court concluded that refunds on some equitable contract-by-contract basis could be ordered only after the Commission determined that the regulated entity's revenues exceeded its revenue requirements for some portion of the locked-in period (Govt. Pet. 46).*** No other conclusion will afford the regulated entity the opportunity of keeping its revenues in substantial balance with its revenue needs. The court's conclusion is also required by this Court's holding in *Second Phillips* (*Wisconsin* v. *F.P.C.*, 373 U.S. 294, *supra*), in which the Court held (373 U.S. at 306):

---

* *United Gas Pipe Line Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332 (1956).

** *Federal Power Commission* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1956).

*** The Examiner had also concluded that refunds could be ordered only to the extent that aggregate industry revenues exceeded aggregate industry costs (J.A. 267d).

> "Since these increased rates were 'locked in', their validity for the future was not at issue; the sole question was whether all or any part of the increases had to be refunded by Phillips. Having decided on the basis of substantial evidence that the increases did not bring revenues up to cost of service, the Commission properly concluded, on the only matter before it with respect to these dockets, *that no refund obligation could be imposed.*" (Emphasis added.)

3. The questions presented in some of the instant petitions relating to the court's action on the issue of special exemptions, appear to be based upon a misconception of the court's conclusion. The court did not require the Commission to include in its order a savings clause which would automatically entitle each producer to a stay of the general order until its claim for exemption was decided. All the court did was remand the case with instructions that the savings clause should contain *guidelines* which, *if followed,* would entitle an aggrieved producer to a prompt hearing and a stay of the general order. The court ruled (Cal. App. 419):

> "An adequate savings clause should contain *guidelines which if followed* by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided." (Emphasis added.)

Thus, the Commission has full authority to promulgate the guidelines which, if followed, will enable an aggrieved party to a meaningful hearing.

Conclusion

The judgment of the court below, remanding the Commission's order for completion of the administrative process, is clearly correct. It would be premature for this

Court to give plenary consideration to this case at this stage of incomplete administrative action. The petitions for writs of certiorari should be denied.

On Petitions for Writs of Certiorari to the United States Court of Appeals for the Tenth Circuit

BRIEF OF RESPONDENT STANDARD OIL COMPANY OF TEXAS IN OPPOSITION

PRELIMINARY STATEMENT

In these cases, the Federal Power Commission, the State of California, several California distributing companies and the City of Los Angeles seek review of a decision of the Court of Appeals. Respondent is a

producer of natural gas in the Permian Basin Area and was a party below. The States of New Mexico and Texas,[1] and certain producers who were parties below,[2] have also filed petitions. The petition of producer Perry R. Bass, *et al.* (No. 1302) is conditional. It submits that all petitions should be denied and prays for a writ only in the event the other petitions should be granted.[3] For reasons hereinafter stated respondent herein submits that review by this Court at this time would be premature and that all petitions should be denied.

QUESTION PRESENTED

Numerous subsidiary issues are presented in the petitions of the various parties already on file. Many of these issues are important if ultimately they remain in the case. But review is now being sought at an interlocutory stage. Accordingly, the sole question before this Court in determining whether writs of certiorari should now issue is whether this Court should consider and pass upon the many questions raised in the various petitions (a) before the administrative record, findings and decision provide a sufficient basis for a court finally to review the validity of the Commission's rate orders under the standards of the Natural Gas Act, and (b)—as to the petitioning producers—before the Commission has issued final rate orders which may not adversely affect them.

---

[1] No. 1291.

[2] Nos. 1274, 1287, 1292, 1294, 1302.

[3] Respondent herein also reserves the right to file a conditional petition for a writ of certiorari in the event other writs should be granted. The time for filing such a petition does not expire until July 17, 1967.

STATEMENT

In its opinion, issued August 5, 1965, in the Permian Basin Area Rate Case, the Commission prescribed maximum and minimum rates for independent producers selling natural gas for resale in interstate commerce from fields in the Permian Basin area of west Texas and southeastern New Mexico.[4] The decision promulgated rate orders on a group or area basis but also provide a special procedure for individual producers to seek exemption from the rates. Essentially, all of the rates were based on average unit costs of producers as a group, including a return on investment fixed by the Commission. The Commission's basic procedure, in computing a cost of gas flowing during the test year, was to allocate various joint costs between gas and liquids, and divide the total gas costs by the total gas volumes to derive unit costs per Mcf. The Commission computed a total of these unit costs,[5] rounded them off,[6] and then, since the costs included a return on investment, prescribed these figures as *ceiling rates.*[7] At the same time, however, the Commission promulgated quality standards and provided that ceiling rates should be adjusted downward by the net cost to the

---

[4] Opinion No. 468, 34 FPC 159, modified on rehearing, Opinion No. 468A, 34 FPC 1068.

[5] 16.43¢ for Texas production of new gas-well gas; 14.39¢ for Texas production of flowing gas. The New Mexico figure was 1¢ less in each case because it was exclusive of state production taxes.

[6] 16.5¢ for Texas production of new gas-well gas; 14.5¢ for Texas production of flowing gas; New Mexico 1¢ less in each instance.

[7] For the computation see the opinion of the court below, Continental Petition, No. 1274, pp. 30a-31a.

pipelines of processing the gas to bring it up to the standards prescribed by the Commission.

A very large percentage of the gas produced in the Permian Basin is sub-quality and requires additional processing to meet the Commission's quality standards.[8] Nevertheless, the Commission made no record or finding as to the cost of pipeline processing. Accordingly, nothing in the administrative record shows what revenues the prescribed rates will yield to the producers. The Commission sought to justify its failure in this regard by saying that the rates were only "geared" to costs, that it considered factors other than costs (although the record does not disclose what the other factors are),[9] that it had allowed a generous rate of return, and that it was satisfied "that the ceiling prices we have fixed 'provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur' in the Permian Basin."[10]

The gap in the Commission's findings concededly relates to a substantial issue. As the court below said:

---

[8] The Commission's standards limited the content of carbon dioxide, hydrogen sulphide, total sulphur, water and other impurities, and established minimum delivery pressures and BTU contents. Much of the gas-well gas produced in the Permian Basin Area contains unusually high quantities of carbon dioxide and sulphur. Additionally much of the gas produced in the area is produced in association with oil and is delivered at relatively low pressures.

[9] See the opinion of the court below, Continental Petition, No. 1274, pp. 31a-32a, 50a.

[10] Opinion below, Continental Petition, No. 1274, p. 33a.

"About 90% of the flowing gas is substandard. We are cited to no figures on the similar percentage of new gas-well gas. The amount of the rate adjustments does not appear in the record because there was no evidence of the extent of quality differentials or of the processing costs of bringing the gas up to standard. At oral argument various estimates were given as to the amount of rate reduction which would result from substandard quality. These were based on statements filed pursuant to the decision but after the record was closed. They ranged from .7 cents to 2.0 cents per Mcf. A spokesman for the Continental Group said that on 1960 volumes a revenue deficiency of some $12 million a year would result. The Commission response in this court to the Skelly motion for stay of the Commission's orders herein said that the reductions in applicable rates because of adjustments for quality standards are expected to result in a revenue reduction of about $10 million annually." (Continental Petition, No. 1274, pp. 41a-42a)

The Tenth Circuit affirmed the Commission's use of the area rate method and accepted most of its underlying determinations. However, it held that the record before the Commission, and the Commission's findings, were deficient, *inter alia,* in that they failed to consider or determine the cost of processing substandard gas. Accordingly, it remanded the case for additional evidence and findings on this question. The court said:

"The Commission says that the impact of the quality adjustments is taken care of in the rate of return which is made generous on this account.

* * *

"A fair rate of return cannot be ascertained with mathematical certainty. Pragmatic adjustments may be made by an agency within the ambit

of its statutory authority. A court must put great reliance on agency expertise in evaluating a rate of return but this does not mean that a court must accept the agency determination in blind faith" (Continental Petition, No. 1274, pp. 42a-44a)

* * *

And again:

"* * * The Commission did not make those findings and indeed it could not have done so because of the failure of the record to disclose the revenue impact of the adjustments in area rates to reflect quality differentials. Whether rate reductions because of quality deficiencies are a risk or a cost, the answer comes out the same. If they are a risk, we do not know the rate of return. If they are a cost, we do not know whether revenue received will equal the reasonable revenue requirements. We believe that under Hope, and under Second Phillips, the area producers, as a group, are entitled to recover their prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. Satisfaction of this requirement must appear through appropriate findings based on substantial evidence. These cannot be made on the record presented." (Continental Petition, No. 1274, pp. 50a-51a)

And again:

"Nothing in Second Phillips rejects the end result test of Hope. We believe that it applies here and that it is not satisfied by a finding of fair relationship. Something more than mere semantics is involved. * * *

"* * * the producer * * * is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. These requirements must

be tested against the record. They may not be brushed aside with a general finding of fair relationship. The Commission concedes that it did not equate * * * costs to * * * revenues. This is obvious because no determination was made of the * * * revenues which the rates will produce." (Continental Petition, No. 1274, pp. 34a-35a)

REASONS FOR DENYING THE PETITIONS

The action of the Court of Appeals in remanding the case for the taking of further evidence and the making of additional findings on the quality issue is, we submit, clearly correct. Further, under any of the contentions of any of the parties, such evidence and findings clearly are relevant. The appropriate exercise of the certiorari jurisdiction of this Court requires that the record be completed before this Court undertakes the review of such questions as may remain in the case after the final determination by the court below. As pointed out above, the amounts involved in the quality determinations are substantial. Further findings may result in rates satisfactory to many of the producers and thus moot issues which are now raised.

The Commission urges "the obvious desirability of winding up this first area proceeding at the earliest possible date" (Petition, No. 1342, p. 18). But only delay can result from an interlocutory review if this Court should agree—as we submit it will—with the conclusion of the court below that findings on the quality issue are necessary to permit appropriate judicial review of the validity of the rate order. Most of the issues in the case have been determined favorably to the Commission by the court below. The issue on remand is a limited one. Any excess rates which may

be collected are subject to appropriate refund. The Commission can best hasten the ultimate determination of all of the issues by expediting its proceedings on remand and providing a record which will permit final review by this Court.

CONCLUSION

All of the petitions for writs of certiorari in these proceedings should be denied.

On Petitions for a Writ of Certiorari to the United States Court of Appeals for the Tenth Circuit

JOINT BRIEF IN OPPOSITION OF INDICATED RESPONDENTS*

* Respondents include 64 producers of natural gas who were petitioners below. This Brief is submitted only on behalf of Respondents whose names are listed *infra*. These Respondents request that this Brief be deemed responsive to *all* pending petitions seeking a writ of certiorari to the United States Court of Appeals for the Tenth Circuit in the Permian Basin Area Rate Case (Nos. 1274, 1287, 1291, 1292, 1293, 1294, 1295, 1302, 1342, and 1412).

PRELIMINARY STATEMENT

In these and related cases, the Federal Power Commission, the States of New Mexico, Texas, and California, other governmental bodies, and certain gas distribution and producing companies seek review of the decision of the Court of Appeals. However, the petitions essentially fall into two distinct categories: three producer petitions challenge the constitutional and statutory basis of area or group rate making *per se*,[1] while the petitions on behalf of the Commission and its supporters challenge the limited remand by the court below and seek total affirmance of the Commission decision (Nos. 1293, 1295, 1342, and 1412). For reasons stated herein, these Respondents submit that review by this Court at this time would be premature, that the petitions seek review at an interlocutory stage, and that all petitions seeking review of the Permian Basin Area Rate Case thus should be denied.

---

[1] These three are Nos. 1287, 1292, and 1294, filed by The Superior Oil Company, Sun Oil Company, and Hunt Oil Company, *et al.* (Superior, Sun, Hunt).

The petition filed by Continental Oil Company and Midhurst Oil Company in No. 1274 essentially challenges the agency's exercise of discretion in its choice of the regulatory method for determining area rates. *Cf. Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U.S. 591 (1944).

The petition filed by Perry R. Bass, *et al.* in No. 1302 is a conditional petition. Petitioners there state that "all petitions for writs of certiorari in this case should be denied and . . . further proceedings should be held by the Federal Power Commission consistent with the opinion of the court below." (Bass Petition, p. 6)

Respondents filing this Brief reserve the right to file similar conditional petitions as to questions decided adversely to them below on January 20, 1967 and on rehearing on April 18, 1967. The time for the filing of such petitions by these Respondents will not expire until July 19, 1967.

OPINIONS BELOW

The opinion of the Court of Appeals remanding the case for further findings is not yet reported. It is set forth in Appendix A to the petition of Continental Oil Company, *et al.* (No. 1274). The opinion of the court granting rehearing in part and requiring further findings is set forth in Appendix B to the petition filed by the Federal Power Commission (No. 1342). The opinions and orders of the Commission are reported at 34 F.P.C. 159 (J.A. 516d-826d), 34 F.P.C. 418 (J.A. 827d-838d), 34 F.P.C. 424 (J.A. 37s), 34 F.P.C. 1068 (J.A. 1105d-1132d), and 34 F.P.C. 1082 (J.A. 1133d-1136d). The opinion of the hearing examiner is reported at 34 F.P.C. 306 (J.A. 97d-364d).

JURISDICTION

The jurisdictional requisites are adequately set forth in the petitions.

STATUTES INVOLVED

The statutory provisions involved are Sections 4, 5, 7, and 19(b) of the Natural Gas Act, 52 Stat. 822, 823, 824, 831 (1938), 56 Stat. 84 (1942), 15 U.S.C. §§ 717c, 717d, 717f, 717o, and 717r, and Sections 8 and 10 of the Administrative Procedure Act of 1946, 60 Stat. 242, 243, as recodified by 80 Stat. 378 (1966), 5 U.S.C. §§ 557 and 704. Sections 4, 5, and 7 of the Natural Gas Act are reproduced in the petition of Continental Oil Company, *et al.* (No. 1274, pp. 3-11); Section 19(b) of the Natural Gas Act is reproduced in Appendix A to this Brief; and Sections 8 and 10 of the Administrative Procedure Act are reproduced in Appendix B to this Brief.

QUESTIONS PRESENTED

1. Numerous subsidiary issues are set forth in the petitions filed by the Commission and its supporters, but there is but a single question before this Court determining whether writs of certiorari should issue as sought by these premature petitions. The Commission decision cannot be affirmed without reversing the holding of the court below that the agency's findings are not sufficiently complete to permit judicial review under *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U.S. 591 (1944), and the question presented thus is:

> Whether the administrative record, findings and decision provide a sufficient basis at this time for a court to review the validity of the agency's rate orders under the standards of the Natural Gas Act.

2. Similarly, there is essentially but a single issue now raised by the producer petitions challenging the Commission's area or group rate method *per se*:

> Whether these petitioners have exhausted administrative remedies, or, stated differently, whether these petitioners may obtain an advisory opinion as to validity of area or group rates as applied to them before their individual rates are determined under the agency's procedures.

STATEMENT

On August 5, 1965, the Commission issued an area rate decision which, *inter alia*, prescribed maximum and minimum rates for independent producers selling natural gas for resale in interstate commerce from fields in the Permian Basin area of west Texas and

southeastern New Mexico (Opinion No. 468, 34 FPC 1068, modified on rehearing, Opinion No. 468A, 34 FPC 1082).

This decision prescribed rates on a group or area basis but also included a limited procedure for producers to apply for specific exception from the area rates. All of the maximum rates prescribed rested upon Commission computations of average unit costs of producers. However, the Commission also required that the ceiling rates based on these group unit cost determinations be adjusted downward by costs incurred by pipelines to bring gas up to "quality" standards set forth in the Commission decision. Although the Commission made estimates of producers' unit costs, and the bulk of record relates to these estimates, there was no record or finding as to pipelines' costs to be used for the required rate deductions, nor was there any basis in the Commission decision to determine the group revenues actually generated by the prescribed rates.

Pursuant to Section 19(b) of the Act, numerous producers sought review of Opinion Nos. 468 and 468A. Upon review, the Tenth Circuit sustained the Commission in most substantial respects, including the Commission's use of the area rate method for establishing just and reasonable rates for producers. However, the court below remanded for the purpose of permitting additional findings required under Sections 4 and 5 of the Natural Gas Act. Essentially, the court below found the Commission's decision deficient in basic, but limited respects:

(1) Although the agency recognizes that its rate orders are subject to the *Hope* "end result" test, it did not and could not make findings re-

quired by that test on the administrative record in this particular case; and

(2) Neither the administrative record nor the decision provided the reviewing court with a basis to measure the impact of the rate orders.

These gaps in the record and decision, and the required corrective steps, were pinpointed by the court below:

> "Nothing in Second Phillips rejects the end result test of Hope. We believe that it applies here and that it is not satisfied by a finding of fair relationship. Something more than mere semantics is involved. * * *
>
> "* * * the producer * * * is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. These requirements must be tested against the record. They may not be brushed aside with a general finding of fair relationship. The Commission concedes that it did not equate * * * costs to * * * revenues. This is obvious because no determination was made of the jurisdictional revenues which the rates will produce." (Continental Petition, pp. 34a-35a)
>
> * * *
>
> ". . . In any event, the lack of evidence as to quality deductions makes it impossible to determine whether the rate of return satisfies the Bluefield and Hope principles and we have no basis on which to appraise the allowance made by the Commission. We respect the expertise of the Commission but the conclusions reached by the use of expertise must accord with legal standards." (Continental Petition, p. 44a)
>
> * * *
>
> ". . . The Commission held that its ceiling prices provided a fair relationship between consumer prices and producer costs. Fair relationship is

pertinent but it is only part of the end result test. We do not know the producers' costs or revenue requirements. We do not know the economic factors which either require or permit departure from costs and revenues. The end result test is not satisfied by a reliance on unknowns.

"We have accepted the Commission's conclusion that contract rates should not be used. The trouble is that the Commission decision rides two horses and we have no way of knowing the outcome of the race. It uses composite cost-of-service evidence, engrafts economic factors on top, and comes out with a rate which it justifies on a fair relationship basis. We have the problem of how in such circumstances a court can determine whether the just and reasonable standard of §§ 4 and 5 has been met. The answer is not found in the record before us." (Continental Petition, p. 50a)

* * *

"... The Commission will hold such additional hearings as are needed to determine the effect of the quality adjustments, and to determine the group revenues and the group revenue requirements. It will make appropriate findings on these matters ..." (Continental Petition, p. 51a)

This limited remand neither condemns the area rate method adopted by the Commission, nor disturbs most of the underlying determinations made by the agency. In effect, the Court of Appeals merely required the Commission to design rates consistent with its other findings,[2] to supplement the administrative record, and

[2] Indeed, the Commission had reversed the hearing examiner on the requirement for rate design findings. The examiner made rate design findings consistent with group rate decisions of other federal agencies. See, *e.g.*, *Re General Passenger-Fare Investigation*, 32 CAB 291 (1960). Significantly, the Tenth Circuit's holding as to required findings is consistent with views expressed by the examiner.

to receive evidence supporting its decision on quality deductions.[3] Hence, the basic holding of the court below is that the Commission has not completed its functions, and the cases have been remanded for that limited purpose.

ARGUMENT

1. Since the Ultimate Question Is Not Ripe for Review, the Petitions Are Premature and Should Be Denied

In rate cases under the Natural Gas Act, the ultimate substantive question is whether the agency has prescribed just and reasonable rates. All other issues are subsidiary to this question. In this case, the ultimate substantive question cannot be answered at this time. This is the holding of the court below and the reason it directed the Commission, upon remand, to complete its rate design findings. Without this step and completion of the agency's functions, a reviewing court cannot determine exactly what rates have been prescribed in fact, and whether those rates are supported by findings based on substantial evidence and preserve, in fact, the rights of all parties to just and reasonable rates.[4]

---

[3] The Commission continues to concede "the precise extent of these deductions was unknown at the time of the decision" (FPC Petition, p. 12), but this is at best an oversimplification. In fact, there is no basis in the administrative record, and none is cited, for the agency's initial "estimates" of these deductions or for any subsequently reported figures, including those set forth in petitions and briefs filed in this Court.

[4] None of the questions presented or reserved in the numerous petitions here directly challenge this basic holding of the court below. The agency petition in particular seeks to obscure the basic holding below and the fact that the holding rests upon this Court's decisions construing Sections 4 and 5 of the Natural Gas Act, particularly *Federal Power Commission* v. *Hope Natural Gas Co., supra.*

The Court of Appeals thus makes clear that neither the record nor the Commission decision reveals the rates prescribed or the effect of those rates upon the revenues and earnings of the producer-respondents. The court noted that the agency, in its brief to the court, conceded that "appropriate price differentials or adjustments could not be made on the basis of the record." (Continental Petition, p. 41a). Furthermore, the court below concluded that the Commission decision does not set forth the rationale by which the Commission may have moved from the evidence before it to its stated conclusions. Because of *prima facie* gaps in the record and in findings of the agency, the court of appeals also deemed it premature to review subsidary substantive issues relating to the Commission's cost determinations. Remand of the case thus was ordered to permit limited further findings and required explanation of the Commission's rationale.

Despite this, the petitions in these cases now assume that this Court should become the forum for arguments on rate design issues in advance of complete agency findings and decision and review under Section 19(b) of the Natural Gas Act. The numerous issues listed in the petitions thus are, in essence, rate design issues normally passed upon by a rate regulatory agency prior to court review. However, the obvious gaps in the agency's findings in this case prevented review of these questions below. The court below also could not review the methodology employed and data relied upon by the agency, which the court described as buried in

a "turmoil of numbers" and "snarl of statistics."[5] The court also stated that "perhaps in the future courts will have to explore the mysteries of allocation . . .," but refused to be drawn into such review at the present time because of the patent inadequacy of the record and findings before it (Continental Petition, p. 39a). Now, however, if this Court granted the premature petitions in these cases, this Court would be forced into review of these questions and into *de novo* consideration of the rate design issues which the Commission should pass upon in the first instance.

Such interlocutory and *de novo* review will not hasten final disposition of this particular case by an area rate order consistent with the Act's standards.[6] However,

---

[5] Numerous motions under Section 19(b) under Natural Gas Act for leave to file additional evidence before the agency were filed with the Court of Appeals. These motions were denied, not on their merits, but on the basis that on remand, opportunity would exist for the agency to determine necessity for receipt of such additional evidence. Thus, if this Court grants the pending petitions, it necessarily will have to rule on these unresolved matters which have been deferred by the Court of Appeals, pending completion of the administrative record.

[6] The remand by the Tenth Circuit does not entail any inordinate delay in issuance of a perfected final order, as alleged in petitions filed in this Court. Certain of these Respondents have already filed with the Commission petitions for convening of a conference to expedite the proceedings on remand. The Commission thus can consider immediately any required supplementing of the administrative record and could proceed promptly with the additional findings required under the Tenth Circuit's remand directive. The perfected final order thus can cure the defects found by the Tenth Circuit, and, in all likelihood, such an order could eliminate many of the issues raised here by producer-petitioners. Beyond this, the Tenth Circuit's remand of the Permian Basin Area Rate Case does not preclude the agency's proceeding to prompt hearings and decision in four other pending area rate cases (Docket Nos. AR61-2, AR64-1, AR64-2, and AR67-1). Three of the latter cases await

if this Court permits the case to be remanded to the agency, the Commission will be afforded the opportunity to fill in the gaps, proceed with limited, but required additional findings, and prescribe rates consistent with the end result test. Review by this Court at this time thus could result in an interlocutory review of what are now but abstract legal issues, and an advisory opinion without an adequate record before the Court for determination of the actual effect of decision upon the abstract issues listed in the petitions. This Court should not undertake what would be tantamount to such advisory review.[7]

2. The Decision Below Is Consistent With Decisions of This Court

The Court of Appeals has not decided an important question of federal law in a manner conflicting with decisions of this Court.

The court below followed *Burlington Truck Lines, Inc.* v. *United States,* 371 U.S. 156 (1962), requiring that agency findings of fact must cover all essential issues and be stated with clarity sufficient to permit judicial review of the agency's conclusions. The court below also held that the agency's general "fair relationship" expressions did not permit a court to determine that the rates prescribed by the agency are supported by substantial evidence and satisfy the tests

---

Commission and examiners' decisions, and the position of most parties is that evidence received or tendered in these cases provides an adequate basis for agency findings held necessary by the Tenth Circuit and the applicable decisions of this Court cited by the Tenth Circuit.

[7] See *Chicago & S. Air Lines* v. *Waterman S.S. Corp.,* 333 U.S. 103, 113 (1948).

of *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U.S. 591 (1944).

Despite this, the Commission and its supporters contend here that the decision below is contrary to *United Gas Pipe Line Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332 (1956). They assert that, contrary to *Mobile*, the decision below would require the agency to fix all rates above certain contract price levels.[8] This is simply not the fact.[9] The Commission and its supporters suggest that the Court of Appeals directed the agency to adopt a specific rate design in prescribing rates that permit realization of the revenues found to be required. Apparently, this contention rests solely upon the court's approval of the Commission's prescription of minimum as well as maximum rates. However, the court's approval of the agency's concept of minimum rates cannot be so distorted into a judicial requirement that the Commission must raise all low contract prices to a maximum rate level. See *Mississippi River Fuel Corp.* v. *Federal Power Commission*, 252 F. 2d 619, 626 (D.C. Cir.), *cert. den.*, 355 U.S. 904 (1957).

The Commission and its supporters also argue that the court's opinion and order on rehearing are "at odds" with *Federal Power Commission* v. *Tennessee*

---

[8] Such Petitioners carefully avoid the later decision in *United Gas Pipe Line Co.* v. *Memphis Light, Gas & Water Division*, 358 U.S. 103, 113 (1958), that natural gas companies shoud be permitted "the economically necessary means of keeping the intake and outgo of their revenues in proper balance."

[9] See, for example, the Examiner's decision at 34 F.P.C. 365-371, JA 244d-253d. Furthermore, such arguments are contrary to the Commission decision fixing minimum rates, 34 F.P.C. 231-232, JA 669d-671d, and *would require this Court to reverse the agency's* use of minimum rates in Opinion 468 and accompanying order.

Gas Transmission Co., 371 U.S. 145 (1962). Such allegations are without merit. This Court's decision in *Tennessee* affirmatively recognized that the Natural Gas Act permits allowance of a rate structure consisting of rates above and below an average cost level but contemplating that the total revenues produced permit recovery of the revenue requirement.[10] See also *Wisconsin* v. *Federal Power Commission*, 373 U.S. 294 (1963). Thus, the Commission and its supporters confuse the question of the overall level of area rates with the question of reasonableness of individual rates. However, the Court of Appeals' decision on issues involving permissible rate structures, as well as its decision on mechanics of computing refunds, is clearly consistent with *Wisconsin* and *Tennessee*.[11]

As shown, petitions filed by the Commission and its supporters thus ignore the principal holding below and seek to substitute premature and subsidiary issues.[12]

---

[10] The Examiner in this case thus held (34 F.P.C. at 372):

> "The reasonableness of area rates concerns the rate level—the average, the maximum and the minimum. Within this framework, the relationship of one rate to another (undue discrimination or preference) is irrelevant to the question of the justness and reasonableness of the over-all structure."

[11] Arguments that the Tenth Circuit's order on rehearing conflicts with this Court's decisions are also premature. The assumption in such arguments—that the court below has held that the Commission *must* permit the collection and retention of unjust and unreasonable rates—is unfounded.

[12] For example, among the premature and subsidiary issues which the agency seeks to magnify into questions calling for this Court's review are (a) whether "quality" deductions are "costs" or "risks," and (b) whether the agency's "savings clause" is adequate. As to the first, the court below did not impose upon the Commission a rigid formula for gas "quality" adjustments. The court merely held that, in the absence of complete findings respect-

All of the arguments of the Commission and its supporters that the court's opinion below necessarily deprives either producers or consumers of rights to just and reasonable rates also can be no more than speculation at this time. All of these arguments also will remain speculation until the administrative proceedings have been concluded by an agency order satisfying the findings requirements of the *Burlington* and *Hope* cases, *supra.*

Beyond this, Superior, Sun, and Hunt seek to overturn the agency's decision adopting area or group rates on constitutional and statutory grounds. The statutory arguments regarding group rate-making *per se* were not accepted by this Court in *Wisconsin* v. *Federal Power Commission, supra,* and need not be reconsidered. The constitutional arguments are premature because rates which might be attacked on these grounds have not been established with finality, and these producers have not availed themselves of the provisions for special exemption from area rates. This Court thus need not issue here advisory opinions on "a question of constitutional law in advance of the necessity of deciding it." *Peters* v. *Hobby,* 349 U.S. 331, 338 (1955).

For these reasons, none of the pending petitions should be granted, as none sets forth questions ripe for review or decided below in conflict with decisions of this Court. Development of sound procedures in group ratemaking will be harmed, not aided, if a reviewing

---

ing costs and rate of return allowance, it could not determine whether the *unknown* actual rate of return allowance, and the *unknown* gas quality price adjustments imposed, are supported by substantial evidence. As to the second, the court did not require "automatic" stay, but held that notice must be given as to "guidelines" to be followed in "savings clause" proceedings, indicating only that, in the traditional sense, the Commission should grant stay for cause shown.

court sanctions an imperfect administrative effort. The decision of the court below permits elimination of gaps and defects in the administrative record and decision and permits expeditious conclusion of these proceedings, consistent with the requirement that an agency articulate and disclose the result of its rate orders. It is therefore unnecessary for this Court to proceed with but an interlocutory review of the Commission's area rate experiment in the skeletal and incomplete form now presented.

CONCLUSION

For the foregoing reasons, all petitions seeking a writ of certiorari to the Tenth Circuit in the Permian Basin Area Rate Case should be denied.

APPENDIX A

Natural Gas Act, Section 19(b)

SECTION 19:

REHEARING; COURT REVIEW OF ORDERS

* * *

(b) Any party to a proceeding under this act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. A copy of such petition shall forthwith be transmitted by the clerk of the court to any member of the Commission and thereupon the Commission shall file with the court the record upon which the order complained of was entered, as provided in section 2112 of title 28, United States Code. Upon the filing of such petition such court shall have jurisdiction, which upon the filing of the record with it shall be exclusive, to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission

and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of the United States upon certiorari or certification as provided in [former] sections 239 and 240 of the Judicial Code, as amended (U.S.C., title 28, sec. 1254).

APPENDIX B

Administrative Procedure Act of 1946, Sections 8 and 10 as Recodified by P.L. 89-554, 80 Stat. 378 (1966)

§ 557. Initial decisions; conclusiveness; review by agency; submissions by parties; contents of decisions; record

(a) This section applies, according to the provisions thereof, when a hearing is required to be conducted in accordance with section 556 of this title.

(b) When the agency did not preside at the reception of the evidence, the presiding employee or, in cases not subject to section 554(d) of this title, an employee qualified to preside at hearings pursuant to section 556 of this title, shall initially decide the case unless the agency requires, either in specific cases or by general rule, the entire record to be certified to it for decision. When the presiding employee makes an initial decision, that decision then becomes the decision of the agency without further proceedings unless there is an appeal to, or review on motion of, the agency within time provided by rule. On appeal from

or review of the initial decision, the agency has all the powers which it would have in making the initial decision except as it may limit the issues on notice or by rule. When the agency makes the decision without having presided at the reception of the evidence, the presiding employee or an employee qualified to preside at hearings pursuant to section 556 of this title shall first recommend a decision, except that in rule making or determining applications for initial licenses—

(1) instead thereof the agency may issue a tentative decision or one of its responsible employees may recommend a decision; or

(2) this procedure may be omitted in a case in which the agency finds on the record that due and timely execution of its functions imperatively and unavoidably so requires.

(c) Before a recommended, initial, or tentative decision, or a decision on agency review of the decision of subordinate employees, the parties are entitled to a reasonable opportunity to submit for the consideration of the employees participating in the decisions—

(1) proposed findings and conclusions; or

(2) exceptions to the decisions or recommended decisions of subordinate employees or to tentative agency decisions; and

(3) supporting reasons for the exceptions or proposed findings or conclusions.

The record shall show the ruling on each finding, conclusion, or exception presented. All decisions, including initial, recommended, and tentative decisions, are a part of the record and shall include a statement of—

(A) findings and conclusions, and the reasons or basis therefor, on all the material issues of fact, law, or discretion presented on the record; and

(B) the appropriate rule, order, sanction, relief, or denial thereof.

* * *

§ 704. Actions reviewable

Agency action made reviewable by statute and final agency action for which there is no other adequate remedy in a court are subject to judicial review. A preliminary, procedural, or intermediate agency action or ruling not directly reviewable is subject to review on the review of the final agency action. Except as otherwise expressly required by statute, agency action otherwise final is final for the purposes of this section whether or not there has been presented or determined an application for a declaratory order, for any form of reconsideration, or, unless the agency otherwise requires by rule and provides that the action meanwhile is inoperative, for an appeal to superior agency authority.

No. .....

HUNT OIL COMPANY, *et al.*,

Petitioners,

v.

FEDERAL POWER COMMISSION,

Respondent.

PETITION FOR A WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

Petitioners Hunt Oil Company, H. L. Hunt, Lamar Hunt, N. B. Hunt, W. H. Hunt, Secure Trusts, Caroline and Loyd B. Sands, Caroline Hunt Trust Estate, Lyda Hunt-Caroline Trusts, Lyda Hunt-Bunker Trusts, Lyda Hunt-Lamar Trusts, Lyda Hunt-Herbert Trusts, Lyda Hunt-Margaret Trusts (Formerly Estate of Lyda Bunker Hunt, Deceased), Hunt Industries (Formerly Estate of Lyda Bunker Hunt, Deceased) and Placid Oil Company, hereinafter referred to as Hunt, *et al.*, pray that a writ of certiorari issue to review the judgment of the United States Court of Appeals for the Tenth Circuit entered in the above entitled case on January 20, 1967.

OPINIONS BELOW

The opinion of the court of appeals is reported at ..... F. 2d ....., and is printed in the Superior Oil Company's Petition for Certiorari, Appendix B, beginning at page 9a. The opinion and orders of the Federal Power Commission (J.A. 516d-826d, 1105d-1132d, 1154d-1157d) are reported at 34 FPC 159, 34 FPC 1063 and 34 FPC 1198.

JURISDICTION

The judgment of the Court of Appeals for the Tenth Circuit was entered on January 20, 1967, and is printed in the Superior Oil Company Petition for Certiorari, Appendix B, on page 60a. On February 8, 1967, the court of appeals extended for a period of 30 days the time for petitioning for rehearing. Producer parties in several companion cases filed petitions for rehearing. The jurisdiction of this Court is invoked under 28 U.S.C. Section 1254(1) and Section 19(b) of the Natural Gas Act, 15 U.S.C. §717r(b).

QUESTIONS PRESENTED

I. Whether the method adopted by the Commission of fixing area *ceiling* rates at the *average* composite cost level of a selected group of companies, without regard to any other factors, meets the Constitutional requirement of assuring producers non-confiscatory rates, meets the statutory requirement that all rates shall be just and reasonable and assures consumers the low-

est reasonable rates consistent with the maintenance of adequate service when:

(1) the record shows average test year revenues of only 13.05¢ per Mcf for gas-well gas and only 12.72¢ per Mcf for all test year gas sales (R. 33006) and the Commission found test year costs of 14.39¢ per Mcf for flowing gas (R. 277655) and 16.43¢ per Mcf for gas-well gas (R. 277606),

(2) only 16 of the 44 producer respondents (as revealed by the workpapers underlying Schedule 3 of Staff Exhibit 170 upon which the Commission relied) whose costs were used to compute the average cost of flowing gas will realize the 12% return found appropriate by the Commission,

(3) the Commission found that the small producers are essential to the welfare of the consumers (R. 277687) and they are the ones who will receive little or no return,

(4) the consumers are required to pay for all costs incurred whether 1¢ or $10 per Mcf, but instead of reimbursing the producers who actually incurred such costs, the producers whose costs were below the average would not only be reimbursed for actual cost incurred but in addition would be given a bonus equal in the aggregate to the costs incurred by other producers in excess of the average,

(5) the consumers under the area method will be required to pay millions of dollars more in rates (that is unit cost exceeds contract prices of many producers) than would be required under the individual company cost of service method assuming the same rate of return for individual producers as allowed for the group,

(6) the two-price system will make future cost determinations of flowing gas administratively infeasible if not absolutely impossible (due to the data collection and allocation problems).

II. Whether in fixing area rates on the basis of average composite costs of a selected group of companies under the just and reasonable standard of the Natural Gas Act and having due regard for the Constitutional prohibition against confiscation, the Commission can:

(1) reduce the rate or require refunds of any producer when average group costs exceed average group revenues, or

(2) reduce the rate or require refunds of a producer when such producer's prudently incurred company wide cost exceeds its company wide revenue.

III. Whether the Natural Gas Act and the Constitution will permit the Commission to impose uniform ceiling rates on all producers in an area regardless of the impact on such producers in such area or in the Continental U. S. when:

(1) the sole basis for the uniform ceiling rate is the average composite cost of a selected group of producers,

(2) no finding has been made either

(a) that the average cost of the group is typical of the average cost of the individual producers, or

(b) that the composite operations of the group are typical of the operations of the individual producers, and

(3) the dispersion of costs between individual companies as shown by the Commission's own Staff Exhibit No. 174 (R. 32963-33000) is so wide or so great as to demonstrate *per se* that the average cost could not be typical of the various companies' costs.

IV. Whether the end result test and impact of the rate order can be determined without considering the propriety of figures and formulas used to arrive at the composite cost and without considering the effect of the ceiling rate on individual producers or on producers as a group in the area or in the Continental United States.

STATUTES INVOLVED

The statutory and Constitutional provisions involved are Sections 4 and 5 of the Natural Gas Act, 15 U.S.C. 717c and 717d and the Fifth Amendment to the Constitution of the United States. The pertinent parts are as follows:

Section 4(a), 15 U.S.C. 717c(a)

> "Sec. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful."

Section 4(e), 15 U.S.C. 717c(e)

> "(e) Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, State commission, or gas distributing company or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter

upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time when it would otherwise go into effect; and after full hearings, either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natural-gas company to furnish a bond, to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas company, and the Commission shall give to the hearing and decision of such questions preference over other questions pending before it and decide the same as speedily as possible."

Section 5(a), 15 U.S.C. 717d(a)

"Sec. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force and shall fix the same by order: *Provided, however*, That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural-gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural-gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or not the lowest reasonable rates."

Amendment 5, United States Constitution

"No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the Militia, when in actual service in time of War or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation."

STATEMENT

This case involves the Federal Power Commission's first attempt to fix just and reasonable rates for independent producers on an area basis.

The first major producer rate case to reach the Commission on the merits was the original *Phillips* Case, 24 FPC 537 (1960) on remand from the Supreme Court, *Phillips Petroleum Co. v. State of Wisconsin*, 347 U.S. 672 (1954). While utilizing individual company cost of service to pass upon a number of increased rate filings in such case, the Commission concluded that the individual company utility type cost of service approach was not appropriate for fixing just and reasonable producer rates for the future. This case is a direct outgrowth of that conclusion. (R. 277575)

The jurisdiction of the court of appeals was invoked under Section 19(b) of the Natural Gas Act, 15 U.S.C. §717r(b).

The hearing before the Commission consumed 258 actual hearing days (including prehearing conferences) during which time 337 main exhibits and numerous supplemental exhibits were received. The transcript consists of more than 30,000 pages.

The Commission refused to receive evidentiary data relating to individual companies (R. 269879). As a result, the Examiner's Decision, the Commission's Opinion and the court decision below are based solely upon consideration of selected group data on an area basis. The Commission issued questionnaires (Appendices A, B and C) for the purpose of gathering costs and drilling data from the Permian Basin Area

producers (R. 270235, 272688, 273253). The Appendix C cost questionnaires were sent to approximately 350 small producers but only 105 responded. This data was completely ignored (R. 277647, 277648). The Appendix B cost questionnaires designed for major producers were completed by 68 producers, 43 having more than 10,000,000 Mcf of test year sales and 25 having less. The Commission relied exclusively on the Appendix B data for its determination of the cost of flowing gas (R. 277647-648). However, data of only 44 of the 68 producers were included in the Commission's cost computation.[1]

The Appendix A questionnaires were sent to all of the 336 producer respondents. Of this number, 240 were completed in a usable manner (R. 275174). This data was used to a limited extent in computing the cost of new gas-well gas, but not the cost of flowing gas.

Ceiling rates were prescribed for more than 1400 producers operating in the Permian Basin area (R. 920) of which only 336 were named as party respondents (R. 277567). Another 2610 gas producers sell gas for processing in plants (R. 17527) and would be subject to the ceiling rates. The Commission prescribed two ceiling rates, one for new gas-well gas and one for flowing gas. New gas-well gas was defined as non-associated gas produced from dry gas reservoirs,

[1] The Commission relied upon its Staff's composite cost of service presentation (R. 277645), found that "the production expense and investment data for gas-well leases which cover some two-thirds of the gas-well gas produced in the area is fully representative of the cost for gas-well gas" (277788), and computed the cost from the data of the three gas lease classifications set forth in Exhibit No. 170, Schedule 3 (R. 32892). The underlying workpapers reveal that only 44 of the 68 producers had gas production in these three gas lease categories.

gas condensate reservoirs and gas from gas cap wells and residue gas derived therefrom sold under contracts executed on or after January 1, 1961 (R. 277601, 277636). Flowing gas was defined as all casinghead gas and residue gas derived therefrom both old and new and old gas-well gas and residue gas derived therefrom (R. 277660). Old gas-well gas is gas delivered under contracts entered into prior to January 1, 1961 (R. 277601). In each case, the Commission used an average composite cost from selected data as the measure of the price (R. 277602 and R. 277645).

The *ceiling* rate for new gas-well gas was fixed at the computed or estimated *average* cost level of finding and producin gas (R. 277604) by using a variety of so-called industry wide data gathered by various organizations, governmental agencies and private concerns for purposes wholly unrelated to the determination of just and reasonable rates.

The *ceiling* rate for flowing gas was fixed at the *average* historical composite cost level (R. 277645) of a selected group of companies. The flowing gas cost was determined by using a combination of Permian Basin area data for production costs (R. 277645-277646) and national data for exploration and development cost (R. 277651) and adding regulatory expense and state production taxes.

Both the new gas-well gas and flowing gas ceiling prices were made subject to quality adjustments. In each case the ceiling rate was to be reduced by an amount equivalent to the cost to the purchaser of bringing the gas up to specified standards. The record does not contain data that would

enable the Commission or the courts to determine the effect of the quality adjustments and the court below remanded the case to the Commission for such additional hearings as might be needed to determine the effect of the quality adjustments and to determine group revenue and group revenue requirements (costs).

The ceiling rates were to apply on a contract-by-contract basis regardless of the cost of the gas involved, the field unit cost, the area or company wide cost of the producer, the time period in which the gas was discovered and developed, the depth of the reservoir or any other factor. The Commission also ordered refunds on a contract-by-contract basis of all amounts collected under Section 4(e) proceedings in excess of the ceiling rates without determining whether there were individual or group revenue deficiencies for prior periods and regardless of any other considerations.

Petitioners and other producers filed petitions for review in the Tenth Circuit challenging the lawfulness of the rates fixed, the denial of the right of individual producers to submit evidence showing their individual revenue requirements (costs), and the ordering of refunds.

The Court of Appeals for the Tenth Circuit issued its decision on January 20, 1967, reversing the Commission's Opinions 468 and 468-A in part and remanding such matters to the Commission for further proceedings. Essentially the remand directed the Commission to (1) hold such additional hearings as are needed to determine the effect of the quality adjustments and to determine the group revenues and group

revenue requirements, (2) make appropriate findings on the above matters, and (3) include in its new order an adequate provision for special relief for individual producers. However, the court of appeals affirmed the Commission's order in the following respects:

(1) The Commission's action in fixing *ceiling* rates at the *average* composite cost level of a selected group of Respondents.

(2) The Commission's failure to determine whether or not the average composite cost determined was typical of either the group of producers whose cost was used or any of the remaining producers.

(3) The Commission's failure to determine whether or not the composite operations of such producers was typical of the group or any member of the group, or any of the remaining producers.

(4) The Commission's failure to receive evidence relating to individual producers and to consider the import or consequences of its rate order upon the individual producers.

(5) The Commission action in ordering refunds of all amounts collected in excess of the ceiling rates on a rate schedule by rate schedule basis without regard to the cost or revenue requirements of the individual producer or the group.

REASONS FOR GRANTING THE WRIT

1. Clearly the questions presented are of the utmost importance in the administration of the Natural Gas Act. Six years after this Court held that independent producers were subject to the jurisdiction of the Federal Power Commission

under the Natural Gas Act, *Phillips Petroleum Co. v. State of Wisconsin*, 347 U.S. 672 (1954), the Commission in deciding its first major producer rate case, *Phillips Petroleum Company*, 24 FPC 537, held that regulating independent producers on an individual company basis was neither logical nor workable and announced its intention of regulating the sales of independent producers on an area basis. The Commission's decision in the *Phillips* case was affirmed by this Court in *Wisconsin v. Federal Power Commission*, 373 U.S. 294 (1963). Since this is the Commission's first effort at regulating rates on an area basis and since this decision, if allowed to stand, will be a controlling precedent in the determination of area rates in all other areas of the United States, the importance of the questions presented can only be measured by the importance of natural gas as a source of energy to consumers throughout the nation. A wrong decision here could very well jeopardize the adequate future supply of gas. Consequently, this case is perhaps more important than all of the other producer cases that have come before this Court.

2. The decision of the court below is in error and in conflict with applicable decisions of this Court.

The decision below conflicts with *Atlantic Refining Company v. Public Service Commission of New York*, 360 U.S. 378 (1959) and *United Gas Improvement Co. v. Callery Properties, Inc.*, 382 U.S. 223 (1965), in that rates fixed on the basis of composite cost do not provide for the lowest reasonable rate consistent with the maintenance of adequate service. This record clearly shows that the unit cost of gas of

many individual companies clearly exceeds the maximum price permitted by their contracts. Regardless of whether rates are fixed on an area or individual company basis, such companies would not be permitted rates in excess of their contract prices. However, the Commission's area rate method affirmed by the court below will result in consumers reimbursing producers for all incurred costs including such costs which are in excess of contract prices. However, the consumers' dollars will not go to the producers who incurred such cost in excess of the average but to producers whose costs are less than the average.

While the Commission held that:

> "Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators, who contribute a large share of the discoveries of new surfaces of gas." (R. 277687)

and that:

> "A return of 12 percent on production activities protects gas consumers * * * It also considers the needs of the smaller independent who traditionally drills much of the Permian exploratory footage and his limited resources to weather even a brief series of unproductive expenditures." (R. 277628),

the ceiling prices actually imposed will deny all except 16 of the producers whose data was considered the 12 percent rate of return held to be appropriate. Only 26 producers (including the 16 who earned 12 percent or more) will earn any return.[2] Thus, not only does the decision conflict with the

[2] Workpapers underlying Staff Witness Fisher's Exhibit No. 170 upon which the Commission computed the flowing gas cost.

requirements of *CATCO* and *Callery*, *supra*, but the end result is inconsistent with the findings of the Commission upon which the result is based.

The decision below is in conflict with *Federal Power Commission v. Hope Natural Gas Company*, 320 U.S. 591 (1944) and *Colorado Interstate Gas Company v. Federal Power Commission*, 324 U.S. 581, (1954) in that rates fixed on the basis of composit average costs do not permit the majority of regulated companies to recover their expenses and earn a reasonable rate of return on investments to the extent their contracts permit. Therefore, the end result is unjust and unreasonable in its consequences. Although the court below held at page 60 that from the standpoint of the producers "it is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital," it upheld the Commission's two-price average composite cost method which results in denying *all but 16 producers* whose costs were considered an opportunity to recover such costs. Since the composite cost of the flowing gas was based upon the data of *44 of* the larger producers (R. 277647, 277648) and since the record reveals that smaller producers as a rule have higher costs than the larger producers (R. 277714) few, if any, of the remaining producers could be expected to recover such costs. Although the court below noted that the Commission "refused to receive individual cost figures" (Slip Opinion, page 37) and although no party suggested that any of the costs were imprudently incurred, the court did not include its its remand a provision requiring the

Commission to allow each producer an opportunity to recover prudent costs actually incurred to the extent its contracts permit. On the contrary, the court passed it off as being characteristic of group rate making, stating:

> "It is self-evident that when average costs are used to compute ceiling prices, the high cost operator will be hurt and some low cost operators may receive windfalls." Slip Opinion, p. 61

In so doing the court relied upon *Acker v. United States*, 298 U.S. 426, 431 (1936), dealing with "extravagant or unnecessary costs" and *Tagg Brothers v. United States*, D.C. Neb. 29 F. 2d 750, 755, affirmed 280 U.S. 420, (1930) concerning rates high enough to enable all agencies to make money. Obviously, these cases are inapplicable because neither the Commission nor the court has determined that any of the costs are extravagant, unnecessary or imprudently incurred and the contract limitations will preclude any company from collecting excessively high rates.

The failure of the Commission and the court below to consider the impact on individual producers of ceiling rates fixed at average composite cost levels is also inconsistent with this Court's holdings in *Federal Power Commission v. Hope Natural Gas Company*, 320 U.S. 591, 603 (1944), *Colorado Interstate Gas Company v. Federal Power Commission*, 209 F. 2d 717, 724 (10th Cir. 1953) reversed on other grounds, *sub nom. Federal Power Commission v. Colorado Interstate Gas Company*, 348 U.S. 492 (1955), *United Gas Pipe Line Company v. Memphis Gas, Light and Water Division*, 358 U.S. 103, 113-114 (1958), and *Wisconsin v.*

Federal Power Commission, 373 U.S. 294, 309-310 (1963), all of which hold that the economic needs of the natural gas companies must be considered.

The Commission's order requiring refunds affirmed by the court below, of amounts collected in excess of the ceiling rates irrespective of whether the group or the individual company ordered to make the refund experienced a revenue deficiency during the period involved is inconsistent and in direct conflict with this Court's holding in *Wisconsin v. Federal Power Commission*, 373 U.S. 294, 306 (1963) wherein it stated:

> "Having decided on the basis of substantial evidence that the increases did not bring revenues up to cost of service the Commission properly concluded on the only matter before it with respect to these dockets that *no refund obligation could be imposed.*" *(Emphasis added)*

The decision below is also in error and in conflict with *United States v. Abilene and Southern Railway Company*, 265 U.S. 274, 291 (1924) and *Interstate Commerce Commission v. Mechling*, 330 U.S. 567, 583, (1947) in that the Commission's area method was upheld without any consideration or determination of whether the composite cost or composite operations were typical of either the group or of the companies making up the group. While accepting "the principle that both the basic figures and the averages obtained therefrom must be typical and representative" (Slip Opinion, p. 61) the court below merely stated that it was convinced that the Commission had not mis-

used its expertise in this field. The court did not cite any evidence or Commission finding to support this assumption nor could it because neither the Examiner nor the Commission made any effort to determine this issue nor the impact of the area ceilings upon individual producers. On the contrary, by refusing to receive individual company data and by collecting cost data without regard to fields, depths, time of discovery and development or any other matter, the Commission effectively precluded any consideration of whether the composite data was representative or typical of the data or operations of the individuals who will be subject to the area ceilings.

CONCLUSION

WHEREFORE, for the foregoing reasons, this Petition for Writ of Certiorari should be granted.

Respectfully submitted,

PAUL W. HICKS,
Counsel for Petitioners.

PETITION FOR A WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

Petitioners, Pacific Gas and Electric Company, Pacific Lighting Service and Supply Company, San Diego Gas & Electric Company, Southern California Gas Company and Southern Counties Gas Company of California, pray that a writ of certiorari issue to review the judgment of the United States Court of Appeals for the Tenth Circuit, entered in the above case on January 20, 1967.[1]

---

[1] The decision of the Court of Appeals involved thirty-two different petitions for review. The respondents to the petition other than Skelly Oil Company are Phillips Petroleum Company; Warren Petroleum Corporation; Mobil Oil Corporation (form-

erly Socony Mobil Oil Company, Inc.); Pan American Petroleum Corporation; Northern Natural Gas Producing Company; Standard Oil Company of Texas, a Division of Chevron Oil Company; Texaco Inc.; Hunt Oil Company jointly with H. L. Hunt, Lamar Hunt, N. B. Hunt, W. H. Hunt, Secure Trusts, Caroline and Loyd B. Sands, Caroline Hunt Trust Estate, Lyda Hunt-Caroline Trusts, Lyda Hunt-Bunker Trusts, Lyda Hunt-Lamar Trusts, Lyda Hunt-Herbert Trusts, Lyda Hunt-Margaret Trusts (formerly Estate of Lyda Bunker Hunt, Deceased), Hunt Industries (formerly Estate of Lyda Bunker Hunt, Deceased), and Placid Oil Company; Humble Oil & Refining Company; Shell Oil Company; The Atlantic Richfield Company (formerly The Atlantic Refining Company) jointly with Dorchester Gas Producing Company, Southland Royalty Company, and Westates Petroleum Company; Continental Oil Company jointly with Sunray DX Oil Company, Sinclair Oil & Gas Company, Cabot Corporation, Sohio Petroleum Company, Joseph E. Seagram & Sons, Inc., Joseph E. Seagram & Sons d/b/a Texas Pacific Oil Company, Gulf Oil Corporation, Murphy Oil Corporation, The Nueces Company, Samedan Oil Corporation, Cities Service Oil Company (formerly Cities Service Petroleum Corporation), Cities Service Production Company (now merged with Cities Service Oil Company), Columbian Fuel Corporation, Amerada Petroleum Corporation, Union Oil Company of California and as Successor to The Pure Oil Company, Tidewater Oil Company, Reef Corporation, and William A. & Edward R. Hudson, Joint Operators; Marathon Oil Company; Sun Oil Company; Independent Petroleum Association of America; The British-American Oil Producing Company; Union Texas Petroleum, a Division of Allied Chemical Corporation; Midhurst Oil Corporation; The Superior Oil Company; Perry R. Bass jointly with Panther City Investment Co., Bass Bros. Enterprises, Inc., Perry R. Bass, Incorporated, and Richardson Oils, Inc.; Columbian Carbon Company jointly with Coltexo Corporation; The State of Texas; Big Chief Drilling Company jointly with King-Stevenson Oil Company, Inc., and Service Drilling Company; Texas Independent Producers and Royalty Owners Association jointly with West Central Texas Oil and Gas Association; State of New Mexico; Gulf Oil Corporation; Amerada Petroleum Corporation; and J. C. Barnes, et al.

CITATIONS TO OPINIONS BELOW

The Opinion of the Federal Power Commission is reported in 34 F.P.C. 159, and is printed in Appendix A hereto, pp. 1-333. On rehearing, the Commission modified its Opinion. Its modified Opinion is reported in 34 F.P.C. 1068, and is printed in Appendix A hereto, pp. 347-377. The Opinion of the Court of Appeals is as yet unreported, and is printed in Appendix A hereto, beginning at p. 382.[2]

JURISDICTION

The judgment of the Court of Appeals was entered on January 20, 1967. The jurisdiction of this Court is invoked under 28 U.S.C. §1254(1) and 15 U.S.C. §717r(b).

QUESTIONS PRESENTED

1. Must the Federal Power Commission, under the Natural Gas Act (15 U.S.C. 717, *et. seq.*), establish area gas rates to allow recovery of the industry's "cost of service" when according to the Commission such a cost of service would include expense items substantially in excess of the actual cost of the gas subject to the rate order?

2. Whether in view of this Court's decision in *Mobile*[3] and in *Sierra*[4] the Federal Power Commision's rate order

---

[2] Because of the length of the Opinions below, they have been printed and bound in a separate volume.

[3] United Gas Pipe Line Co. v. Mobile Gas Corp., 350 U.S. 332 (1956).

[4] Federal Power Com. v. Sierra Pacific 350 U.S. 348 (1956).

is unlawful because it did not abrogate all producer contracts with prices below the applicable area rates found by the Commission to be just and reasonable to permit all producers to recover such rates?

3. Whether the Federal Power Commission need, at this time, in an area rate case establish detailed administrative procedures for individual producer relief, including provisions for a stay of the entire general rate order?

4. Whether the Federal Power Commission's Opinion No. 468 is a lawful and enforceable order of the Commission?

STATUTE INVOLVED

The statutory provisions involved are Sections 4 (15 U.S.C. §717c), 5 (15 U.S.C. §717d), and 19 (15 U.S.C. §717r) of the Natural Gas Act. They are printed in Appendix B hereto, p. 432.[5]

STATEMENT

This Court is already familiar with the background which led to the Federal Power Commission's first area rate decision, which has now been remanded by the Court of Appeals. It is recited in full in Mr. Justice Harlan's Opinion in *Wisconsin v. Federal Power Commission*, 373 U.S. 294, 295-302 (1963), hereafter referred to as *Second Phillips*, and the facts there set forth need not all

[5] The appropriate provisions of the Natural Gas Act have been printed and bound with the Opinions below.

be repeated here except to state that the Commission's decision had its genesis in *Phillips Petroleum Co. v. Wisconsin*, 347 U.S. 672 (1954).

This Court will recall that following the remand in *Phillips Petroleum Co., supra* (which charged the Commission with the duty to regulate rates charged by the natural gas producers), the Commission reinstated its investigation of Phillips Petroleum Company's natural gas rates; and following extensive hearings, briefs and arguments, concluded:

> ". . . that the individual company cost-of-service method, based on theories of original cost and prudent investment, was not a workable or desirable method for determining the rates of independent producers and that the 'ultimate solution' lay in what has come to be known as the area rate approach: 'the determination of fair prices for gas, based on reasonable financial requirements of the industry' for each of the various producing areas of the country."[6]

Following its decision in *Second Phillips, supra,* the Commission set down its first area rate case on December 23, 1960. It was to encompass an oil and gas producing area known as the Permian Basin which the Commission characterized as "one of the nation's great oil and gas provinces."[7] This Basin is located in southeastern New Mexico and western Texas. It forms the most important natural gas supply area for Petitioners.

---

[6] Second Phillips, *supra,* 373 U.S. at 298-299.

[7] Opinion No. 468, p. 1 (J.A. 529d, R. 277567).

Together these Petitioners serve natural gas to over five million individual homes and businesses in their respective service areas in California, which are inhabited by over 90 percent of the State's total population of nineteen million persons. These companies are vitally interested in the outcome of this proceeding because about 65 percent of their total natural gas supply comes from pipelines whose major source of natural gas is in the Permian Basin area. Physically, nearly all the gas involved in this proceeding flows westward to markets in California or smaller markets along the way. This supply of natural gas, *its price and the stability of that price* are of critical importance to Petitioners and their natural gas consumers.

Actual hearings in the Permian proceeding commenced on October 11, 1961, and concluded on September 12, 1963. Two hundred fifty-one hearing days were involved, and the hearing transcript covers 30,230 pages. Three hundred thirty-seven exhibits were introduced by the parties. The matter was then submitted to a hearing examiner of the Federal Power Commission who rendered his decision on September 17, 1964. Following briefs on exceptions, oral argument was heard by the full Commission beginning on February 8, 1965. On August 5, 1965, the Commission issued its opinion. Following petitions for rehearing, the Commission issued Opinion No. 468-A on October 4, 1965, denying applications for rehearing, but modifying its initial opinion where it deemed appropriate.

We participated extensively in the proceeding by presenting evidence, cross-examination, briefing and argu-

ment. Much of the evidence we sponsored formed the basis of the Commission's ultimate decision.

On September 13, 1965, Skelly Oil Company petitioned for review by the Court of Appeals for the Tenth Circuit, and other respondent producers followed suit. Petitioners intervened and actively participated by brief and argument. On January 20, 1967, the Court of Appeals issued its opinion remanding the Commission's decision for further proceeding in accordance with that opinion. On February 1, 1967, the Federal Power Commission announced it intended to request the Solicitor General to seek Supreme Court review of the Court of Appeals decision on behalf of the Commision. Between March 6 and March 10, 1967, a number of respondent producers petitioned the Court of Appeals for rehearing on a limited number of issues.

REASONS FOR GRANTING THE WRIT

1. The Remand Ordered by the Court Below Would Result in Fruitless and Unnecessary Delay of Producer Regulation.

The Court of Appeals upheld the basic framework of the method of regulation adopted by the Commission. In doing so it approved the area method of regulation, the two price system adopted by the Commission, the cutoff date proposed, and the moratorium on price increases, all essential to the effectiveness of the Commission's action. It nevertheless remanded to the Commission for further proceedings, the matters encompassed in our statement of questions presented.

Review by this Court is necessary to avoid such a remand, which will fruitlessly enlarge the delay already lasting 13 years in the Commission achieving the goal of this Court's mandate in *Phillips Petroleum Company, supra,* to effectively regulate producers rates. Indeed, the entire question of the proper regulation of producer prices under the Natural Gas Act must in any event ultimately reach this Court. The orderly administration of the Natural Gas Act and the imperative need for the earliest possible protection of the gas consumers would seem to require that the date for a definite decision from this Court be delayed no longer. *Atlantic Ref. Co. v. Public Serv. Com.,* 360 U.S. 378 (1959). The Commission has long struggled with the duty imposed upon it to regulate producer rates. The history of this struggle can be read in the decisions of this Court in the years since 1954 which have arisen from Commission action. And now, in this case, the Commission has come forward with the method of regulation which not only satisfies its conception of the requirements of the Natural Gas Act, but in large measure satisfies the requirements of the Court below.

The Commission's opinion opened with:

> "This is the first area proceeding to determine just and reasonable rates for natural gas producers. It is the culmination of an effort initiated more than four and a half years ago, and which has been carried forward with the greatest sense of urgency on the part of all concerned." 34 FPC at 171, J.A. 529d, R277, 568.

This sense of urgency was the result of the recognition by all concerned, including the Commission, that this case was the most important one to be heard by the Commission since it was impressed with the duty to regulate the rates of independent producers. The interim efforts of the Commission in attempting to fulfill this duty have been heard by this Court. This decision is of far greater importance than the interim decisions already heard, and it is, therefore, most certainly worthy of this Court's immediate consideration.

The effect of the Court's remand of the Commission's decision can best be described by the following quotation from this Court's opinion in *Second Phillips, supra.*

> "Such a remand undoubtedly would have consumed considerable time and energy, including that of the Commission and its staff, and would almost certainly have involved another decision by a hearing examiner, another appeal to the Commission, another petition for rehearing and further judicial review of complex and difficult issues. In short, the alternative rejected by the Commission would not have resulted in definitive regulation of Phillips' rates immediately or in the near future. Indeed, several years might have elapsed before even the method of regulation which the Commission regards as unsuitable would have become effective as to even this one producer." (373 U.S. at 311-312)

We urge this Court to immediately grant this writ of certiorari (even though there may be petitions for rehearing pending in the Court below) in order to completely review the *entire* decision so that the uncer-

tainty in this important regulatory area can be brought to a prompt end. To not grant this writ before the end of the current term of the Court will delay ultimate resolution for another year. Continued delay will seriously hamper effective regulation.

2: The Rate Order Adopted by the Commission is Not Unlawful.

(a) There Has Been No Showing that the Commission's Rate Order Will Not Permit Revenues Adequate to Recover the Producers' Actual Cost of Gas Sold.

The Court below, in the absence of any showing that the actual cost of the gas being sold by the producers exceeded the allowed rates, either individually or as a group, concluded that the rate order was unlawful because the Commission did not specifically find that its applicable rates, including quality adjustments, would recover the total "cost of service" of the producers as a group. The "cost of service" includes not only the cost of production but also the cost of finding new reserves and additional reserves to meet estimated future demands. The Commission in discussing these items of cost said in respect to the bulk of the gas subject to the rate order:

> "While the cost of residue gas cannot be found with the precision requisite to serve as a basis for fixing ceiling prices, the evidence in the record makes clear that with respect to casinghead gas and residue gas derived therefrom (which together make

up by far the largest share of the Permian gas subject to quality adjustments) the costs are substantially below the 14.5 cents per Mcf ceiling price. For one thing the price includes a 4.08 cents allowance for exploration and development expense even though such gas was largely found as a by-product of the search for oil. For another, there would be no reason to allow producers a 12 percent rate of return on their investment for processing residue gas since the investment in processing plants and equipment is subject to few of the special risks incurred by those who explore for and develop reserves of gas.

"We do not mean to suggest that the E&D allowance and the profit which we have provided for flowing gas is not fully justified, but we believe it is relevant to point out that these two items, which account for 9.0 cents of the 14.5 cents price for flowing gas, are based in part on justifications other than cost, and provide ample allowance for the risk that low-quality gas in the area may not command the full area price." (Opinion No. 468A, p. 6; J.A. 1112d-1113d, R278, 709-R278, 710)

The court below completely ignored the above finding and statement of the Commission and ignored its own following observation:

"We agree with the Commission that the expense items included in an individual cost-of-service are not the measure of a confiscatory rate. A producer has no constitutional right to be reimbursed for

> dry-hole expenses. Also it has no obligation to remain in business by replenishing the supplies of gas which form the basis of present obligations. Inability to continue exploration and development is not confiscation. We conclude that the impact of the Permian rates on the high cost producers does not destroy the area rate method. (Appendix A, p. 416-417)

Not only has there been no showing of confiscation, but the record before the Commission and above quoted statement of the court below establishes that rates fixed on the basis of "cost of service" are above the actual costs of gas sold.

We do not mean to suggest, as the Commission in the above quotation did not mean to suggest, that it is either improper or not in the public interest to provide for an adequate exploration allowance to replace gas sold and obtain additional reserves. However, we do suggest that the rates established by the rate order cannot be held to be unlawfully low merely because the Commission did not specifically find that such rates would permit the recovery of revenues adequate to cover a "cost of service" which, the Commission said, substantially exceeds the actual cost of the gas subject to the order.

The court below read *Hope* [(*Federal Power Comm'n v. Hope Nat. Gas Co.*, 320 U.S. 591 (1943)] as in effect requiring the Commission to find the cost of gas sold by producers as a group and provide rates to cover such costs. The conclusion of the Commission based on sub-

stantial evidence that its rates were above such costs was held to be insufficient. In so holding the court below overlooked the rule laid down long ago by this Court, that on judicial review appellate courts could not upset the rate order unless confiscation is clearly shown. [*Los Angeles G & E Co. v. Railroad Comm'n,* 289 U.S. 287 (1932); *Lindheimer v. Illinois Bell,* 292 U.S. 151 (1933).]

The court below also overlooked the very words of *Hope* itself that

> " . . . the Commission's order does not become suspect by reason of the fact that it is challenged. It is the product of expert judgment which carries a presumption of validity. And he who would upset the rate order under the Act carries the heavy burden of making a convincing showing that it is invalid because it is unjust and unreasonable in its consequences." 320 U.S. at 602 (citations omitted)

This principle was reapproved by this Court in *Second Phillips, supra,* which involved the precise subject here at issue — ratemaking on an area basis. 373 U.S. at 309.

There was no showing that the rate order was confiscatory, there was no showing that the rate order was unjust and unreasonable in its consequences, and the Commission found precisely to the contrary on substantial record evidence.

It is our view that the Commission satisfied the *Hope* "end result" test; and indeed it is more than apparent that this was its goal in Opinion 468.

(b) The Court of Appeals' Decision is Incompatible With This Court's Pronouncements in the *Sierra* and *Mobile* Cases.

The Court of Appeals' decision is in clear conflict with this Court's decisions in *Sierra*[8] and *Mobile*.[9] The Court of Appeals implies that in testing to determine whether the revenue requirement of the industry is being satisfied so as to meet the *Hope* test, the Commission must take into consideration and compensate for revenue deficiencies caused by contractual price restrictions the producers have contractually bound themselves to.

This Court, in *Sierra*, held that contractual obligations cannot be upset by a regulatory agency unless there is a finding that the public interest requires it. The Commission can increase the contract rate only when it is so low as to adversely affect the public interest.

> "In such circumstances the sole concern of the Commission would seem to be whether the rate is so low as to adversely affect the public interest — as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory." 350 U.S. at 355.

The Commission's Opinion No. 468 found that the public interest did require a floor or minimum rate. It set this rate at 9 cents per Mcf. It did not find that the public interest required that the area rate be raised to

---

[8] Federal Power Com. v. Sierra Pacific, *supra.*

[9] United Gas Pipeline Co. v. Mobile Gas Corp., *supra.*

compensate for low contractual commitments, nor did it find that rates in excess of 9 cents, but below the area ceiling, should be raised to the area ceiling to insure that revenues will balance costs. For the Commission to have done so would have been error, for there is no evidence in the record to sustain such a result. Nevertheless, the Court of Appeals implies that low rates must be raised to the area rate without the requisite finding that the contract rate is so low as to affect the public interest. This, we submit, misreads *Sierra* and *Mobile*. The Court of Appeals' holding should not be permitted to stand.

(c) The Court of Appeals' Suggestion Regarding the Savings Clause is Premature and Would Create Administrative Havoc.

Another error is the Court of Appeals' position on the savings clause — that clause which the Commission inserted in its decision to allow special relief when the public interest or constitutional considerations so required. The Court of Appeals found the Commission's provision "vague and nebulous." It said:

> "An adequate savings clause should contain guidelines which if followed by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided."[10]

It would be highly inappropriate to remand this important case for the purpose of establishing administrative procedures for savings clause relief. The lower court's

---

[10] Appendix B, page 419.

concern regarding the detailed operation of the savings clause is premature. The appropriate time for judicial review of administrative procedures involving the savings clause would arise at such time as a producer seeks savings clause relief and is denied such relief as a result of procedural or substantive error on the part of the Commission. Further, the blanket mandatory "stay of the general order" suggested by the Court is judicially unique — traditionally, stays have been granted on the basis of the particular circumstances of each case. Adoption of the lower court's stay requirement would lead to administrative chaos completely frustrating effective area rate making.

CONCLUSION

"[T]o afford consumers a complete, permanent and effective kind of protection from excessive rates and charges,"[11] which Congress promised and this Court affirmed, immediate action is needed by this Court. This petition for a writ of certiorari must be granted this term so that further delays — which are in our view harmful to the entire gas industry — will be prevented.

OPINION NO. 468

OPINION AND ORDER DETERMINING JUST AND REASONABLE RATES FOR NATURAL GAS PRODUCERS IN THE PERMIAN BASIN

(Issued August 5, 1965)

INTRODUCTION

SWIDLER, Chairman:

This is the first area proceeding to determine just and reasonable rates for natural gas producers. It is the culmination of an effort initiated more than four and a half years ago, and which has been carried forward with the greatest sense of urgency on the part of all concerned. The area is the Permian Basin, one of the nation's great oil and gas provinces, comprising the counties of Chaves, Eddy and Lea, New Mexico, and Texas Railroad Commission Districts No. 7-C and No. 8.

Pursuant to Section 5 of the Natural Gas Act we here establish the future rates for jurisdictional sales of gas by producers in the area.[1] Also consolidated in this area proceeding are a large number of increased rate filings suspended under Section 4 of the Act and a limited number of applications for certificates of public convenience and necessity pursuant to Section 7 which are disposed of in a separate order issued this date.

The Commission initiated the proceeding by order of December 23, 1960 (24 FPC 1121). Prehearing conferences were held in Midland, Texas, beginning March 6, 1961, and in Washington on April 27, 1961. Forty-seven petitions to intervene were granted. The number of parties in the proceeding total 384, including 336 gas producers who are respondents.

---

[1] The respondents are listed in Appendix A to this opinion.

The Commission prescribed questionnaires for the major producer respondents to obtain information with respect to Permian Basin and nationwide cost and operating experience. 26 FPC 247, 514, 531 (1961). A special form was prescribed for the small producers. 27 FPC 20 (1962). (The dividing line between major and small producers was determined by the level of nationwide jurisdictional sales, 10 million Mcf in calendar year 1960). A significant early ruling in this proceeding was the Commission's order of May 14, 1962, holding that individual company cost-of-service evidence would not be received in evidence but that composite cost studies would be admissible. 27 FPC 943 (1962).

The hearings extended over a period of almost two years beginning on October 11, 1961, and closing on September 12, 1963. The examiner rendered his decision on September 17, 1964.

Fourteen individual and joint briefs on exceptions were filed on behalf of 111 respondents and numerous other interested persons, not parties, who joined with them. Most of the producers adopted the briefs on exceptions of Continental Oil Company (Major Producer Group).[2] Separate briefs were filed by the Com-

[2] Respondents filing independent or supplemental briefs on exceptions included Amerada Petroleum Corporation (Amerada); Humble Oil and Refining Company (Humble); Hunt Oil Company, *et al.* (Hunt); Perry R. Bass (Operator), *et al.* (Bass); Phillips Petroleum Company (Phillips); Placid Oil Company (Placid); Standard Oil Company of Texas, a Division of California Oil Company (Standard); Sun Oil Company (Sun); Superior Oil Company (Superior); and Warren Petroleum Corporation (Warren).

mission staff, by the numerous interveners and as *amici curiae* by several groups with a substantial interest in the general problem.[3]

Oral argument lasting three days was held beginning February 8, 1965, and the proceedings are now before us for decision.

SUMMARY OF EXAMINER'S DECISION

We acknowledge at the outset our indebtedness to Examiner Wenner for his penetrating analysis of the basic economics of the industry and his constructive proposals for a pricing system in harmony with the realities of the industry and the Commission's responsibilities under the Natural Gas Act. We must acknowledge also the helpful and constructive role of the parties to the proceeding. The cooperation of the respondents and the interveners with the Commission has been instrumental in achieving what the examiner has described as a breakthrough in reaching a workable method of producer regulation.

---

[3] Interveners filing briefs on exceptions included Northern Natural Gas Company (Northern); King-Stevenson Oil Company, Inc., *et al.* (Oklahoma Interveners); the State of California and the Public Utilities Commission of California (jointly referred to as Cal-PUC); a group of California distributors (California Distributors); the City and County of San Francisco (San Francisco); the City of San Diego (San Diego); the State of Texas jointly with Texas Independent Producers and Royalty Owners and West Central Texas Oil and Gas Association (Texas-TIPRO-WCTOGA); and the Independent Petroleum Association of America (IPAA). Briefs on exceptions as *amici curiae* were filed by Philadelphia Electric Company (Philadelphia); Associated Gas Distributors (AGD) (a group of approximately seventy major distributors) and the Oklahoma Independent Petroleum Association (OIPA).

The examiner's decision would establish ceiling prices to apply, with certain exceptions, to all the sales being considered in this proceeding. These proposed ceilings were, in the case of rate schedules filed with this Commission on or after December 23, 1960, 16.75 cents per Mfc for gas-well gas, 15 cents per Mcf for residue gas, and 11 cents per Mcf for oil-well gas. In the case of rate schedules filed before December 23, 1960, the proposed ceilings were 13.5 cents per Mcf for gas-well gas and residue gas and 10 cents per Mcf for casinghead gas. The presiding examiner found, however, that the rates of producer-respondents making jurisdictional sales of less than 10,000,000 Mcf annually were just and reasonable and did not apply the proposed ceilings to any such respondents. Operators of processing plants, even if selling less than 10,000,000 Mcf annually, would have their rates limited by the proposed ceilings.

In the case of Section 4(e) proceedings consolidated herein, the examiner would order certain refunds which were to be computed for separate years and categories of gas on the basis of whether the industry had realized more than the proper revenue as well as on the basis of the individual rates collected. Deficiences in one category would be used to offset excessive revenues in

other categories each year. The presiding examiner further stated that since the record does not contain information needed to determine the actual or proper revenue for years other than 1960, for such years the parties

within 90 days of the initial decision should submit draft orders with requests for information and with specific proposals regarding refunds.

The presiding examiner declared most favored-nation clauses and spiral escalation clauses in existing contracts to be inoperative and of no legal effect, and would allow no future change in rate resulting from any such clause to take effect. He fixed a minimum price of 9 cents per Mcf for residue and gas-well gas and 7 cents per Mcf for casinghead gas, and would allow rate increases to these levels to be filed with the consent of the buyer.

THE NATURAL GAS INDUSTRY AND ITS ACTIVITIES IN THE PERMIAN BASIN

The major known deposits of natural gas in the United States are located primarily in the States of Texas, Louisiana, Oklahoma, New Mexico, and Kansas. In addition, there are substantial reserves in the offshore area of Louisiana and Texas. More than 70 percent of all the natural gas produced for marketing in the United States is sold in interstate commerce subject to the jurisdiction of the Commission. The Permian Basin alone accounts for about 11 percent of all the gas moving into the interstate market.

Natural gas and crude oil are both hydrocarbons, and they are often found in common reservoirs. As a result gas and oil production are interrelated. Our responsibility is confined to regulating the sales of natural gas. In his opinion (p. 23) the examiner classified natural gas as "oil well gas" or "gas well gas", depending upon

the conditions of production. He used the term "residue gas" to describe oil-well gas or gas-well gas after it has been processed and the liquids removed.

277,571

— 5 —

The natural gas industry is divided into three distinct segments. First there are the producers. Jurisdiction under the Natural Gas Act attaches when the gas is sold for resale in interstate commerce. The intermediate segment of the industry consists of the interstate pipeline companies which transmit the gas from the producing fields through large diameter pipelines as much as a thousand miles or more to centers of distribution throughout the nation. The third segment of the industry comprises the distributors of the gas in thousands of communities throughout the nation who are under state or local regulation exclusively, but who rely on this Commission to regulate the price at which they purchase gas at wholesale from the interstate pipelines. It should be noted that there is some overlapping in these categories. Some pipeline companies produce a share of their own natural gas and sell gas to other pipelines; other engage in distribution operations. Also, some producers perform gathering or transportation services and some distributors engage in production and transmission activities.

The Permian Basin is a major geological formation underlying much of western Texas and southeastern New Mexico. It is rich in oil and gas deposits, and is one of

the major hydrocarbon producing areas in the Western Hemisphere.

About two-thirds of the gas produced in the Permian Basin is oil-well gas, that is, gas produced in conjunction with oil. By contrast, oil-well gas represents only about one-third of the total gas production in the continental United States. Oil-well gas is limited as to the hours of availability in a month since it is governed by the allowable oil production, which is subject to state regulation. The gas must be produced as the oil is produced, and it is not produced at any other time. It is produced on such a basis as will maximize the production of oil, for which it is the lifting agent. In

these respects it contrasts unfavorably with gas-well gas, which while subject to state prorationing authority on a field basis, can be produced on a demand schedule. Oil-well gas is also produced at lower pressures than those common to gas-well gas. Production at less than 50 pounds pressure is not unusual in the case of oil-well gas. Since pipelines require pressures approaching one thousand pounds, low-pressure gas must be compressed before it can be taken into a pipeline stream. Processing of such gas will include one, two, three or more stages of compression.

In the Permian Basin, most oil-well gas is "sour" gas before processing.[4] Some of the gas from the Permian Basin also has an unusually high carbon dioxide content, ranging in some instances as high as 50 percent. Carbon dioxide is non-flammable and is presently useless to the petrochemical industry. When present in significant quantities it must be removed, entailing both processing costs and reduction in the volume of gas which remains for use.

Historically, prices for gas in the Permian Basin have been lower than prices in most other areas. For many years oil-well gas was vented or flared, because there was no market for it. Three interstate pipelines, however, now make substantial purchases of gas in this area, and venting or flaring has been reduced to very low levels. El Paso Natural Gas Company (El Paso) began purchasing Permian Basin gas in 1945 for interstate transmission in connection with construction of the first natural gas pipeline from Texas to California. It was the sole interstate purchaser until 1954. In that year Northern Natural Gas Company (Northern) made its first purchase in the Permian Basin through Permian Basin Pipeline Company. In 1958 Transwestern Pipeline Company (Transwestern) began its purchases in the Permian Basin to supply the second pipeline from that area to California.

---

[4] "Sour" gas is considered to be gas containing 10 or more grains of hydrogen sulphide or 200 or more grains of total sulphur per Mcf. The sulphur content of Permian Basin oil-well gas is generally higher than that of gas from any other area in the United States.

In 1961 El Paso purchased 73 percent of the Permian gas moving in interstate commerce; Northern accounted for 18 percent, and Transwestern for 9 percent. It is estimated that 85 percent of the gas moving in interstate commerce from the Permian Basin goes to California, an area of rapidly expanding demand by both industrial and residential consumers. The gas-producing wells in the Permian Basin, therefore, are some 900 to 1,300 miles from the principal points of use for the gas.

HISTORY OF THE DEVELOPMENT OF THE AREA APPROACH TO PRODUCER REGULATION

The Federal Power Commission's regulation of the rates of electric utilities and natural gas pipeline companies under the Federal Power Act and Natural Gas Act had uniformly been conducted on an individual cost-of-service basis at the time of the Supreme Court's *Phillips* decision on June 7, 1954[5] which held that the Commission had jurisdiction over the regulation of well-head gas prices, a jurisdiction the Commission had theretofore questioned. Faced with the novel problem of regulating thousands of gas producers, the Commission's first guarded attempts at producer regulation were on an individual company basis.[6] A few of the first rate in-

[5] *Phillips Petroleum Co.* v. *Wisconsin,* 347 U.S. 672 (1954).

crease filings were approved on the basis of cost evidence.[7] In other cases where the producer failed to submit evidence founded on the conventional rate base method of regulation, the Commission dismissed the rate increase[8] on the assumption that in the absence of such cost support it was bound to do so by *City of Detroit* v. *F.P.C.*, 230 F. 2d 810 (CADC, 1955), certiorari denied 352 U.S. 829 (1956), a case dealing with a pipeline's own gas production. On review of these rate increase dismissals the Court of Appeals for the Fifth Circuit

agreed that the evidence as to field prices coupled with opinion testimony as to the need for an incentive price to induce adequate exploratory and development activity was not enough to demonstrate the rates were just and reasonable but held the Commission should have given the producers further opportunity to present evidence. The Court also indicated that the Commission need not require conventional rate base evidence if other cost evidence was available to insure that consumers were not paying more than a just and reasonable price, and need not fix separate rates for each producer if it found a uniform rate for the field desirable.[9]

[8] See *e.g., Union Oil Co. of California,* 16 FPC 100, 110 (1956).

[9] *Bel Oil* v. *F.P.C.*, 225 F. 2d 548 (CA5, 1958), certiorari denied 358 U.S. 804 (1958); See also *Forest Oil Corp.* v. *F.P.C.*, 263 F.2d 622 (CA5, 1959).

The area concept also had its origin in proceedings under Section 7 of the Act upon applications for certificates of public convenience and necessity by gas producers. As early as November 28, 1955, in *Cities Service Gas Co., et al.*, 14 FPC 134 (1955), affirmed as *Signal Oil & Gas Co.*, v. *F.P.C.*, 238 F. 2d 771 (CA3, 1956), certiorari denied 353 U.S. 923 (1957), the Commission conditioned a producer certificate to the price level prevalent in the area (14 FPC at pp. 147-148). In some later cases the Commission failed to impose a condition on the initial price, the important example being the CATCO case,[10] relating to the offshore Louisiana area. As a result the Commission was reversed by the Supreme Court, which held that the Commission must impose a condition when the price was "out of line" in the area of production.[11] The area price concept was further developed in other cases remanding Commission orders granting unconditioned certificates.[12]

In the 1956-1959 period, a number of producer cases were initiated as investigations under Section 5(a) of the Gas Act. The first major case to reach the Commission

on the merits was the original *Phillips* case,[13] on remand from the Supreme Court. The Permian case is a direct outgrowth of *Phillips*. In that case the Commission first considered the numerous questions relating to Phillips' cost-of-service, including the difficult allocation of costs between Phillips' oil production and its gas production. While utilizing individual company cost-of-service to pass upon a limited number of increased rate filings, the Commission concluded that such an approach was not appropriate for fixing just and reasonable producer rates for the future. Accordingly, the Commission refused to fix Phillips' rates for the future on this basis. The Commission spelled out in detail the many reasons why the individual company cost-of-service approach did not offer a reasonable basis for determining the just and reasonable prices for sales of gas by producers in interstate commerce. It also pointed out that the administrative burdens of literally thousands of separate proceedings in itself demonstrated the complete infeasibility of attempting to achieve effective regulation on an individual company basis.

On the same day, September 28, 1960, that it issued its *Phillips* opinion the Commission issued its Statement of General Policy No. 61-1 (24 FPC 818 (1960), initiating the area rate approach by establishing guideline ceiling prices for the various producing areas. Separate levels were listed by the Commission for the initial prices at which it would certificate new sales of

---

[13] *Phillips Petroleum Co.*, 24 FPC 537 (1960).

gas and for accepting without suspension price increases under existing rate schedules.

The Commission in prescribing guideline prices attempted to take into account all of the relevant information available to the Commission at the time. These

guideline prices did not purport to be the just and reasonable rates, but rather the interim guides the Commission would follow in issuing certificates and in deciding whether to suspend rate increases until just and reasonable rates could be determined after hearing in area rate proceedings. As a result of the guidline price policy, in a practical sense the area rate approach has been in effect on an interim basis for the past 4 years.

On review, the *Phillips* opinion was affirmed by the Court of Appeals and by the Supreme Court.[14] The courts upheld the Commission in going forward with the area method of regulation. The Supreme Court said (p. 310):

> We respect the Commission's considered judgment, backed by sound and persuasive reasoning, that the individual company cost-of-service method is not a feasible or suitable one for regulating the rates of independent producers. We share the Com-

[14] *Wisconsin* v. *F.P.C.*, 303 F. 2d 380 (CADC, 1961) affirmed 373 U.S. 294 (1963).

mission's hopes that the area approach may prove to be the ultimate solution.

The Commission has proceeded with its program to implement the area rate approach. In addition to the present proceeding, AR61-1, for the Permian Basin, a proceeding was begun on May 10, 1961, to determine area rates for the Southern Louisiana area, AR61-2, 25 FPC 942 (1961), and on November 27, 1963, area rate proceedings were instituted for the Hugoton-Anadarko Area, AR64-1, and for the Texas Gulf Coast Area, AR64-2, 30 FPC 1354 (1963). These four proceedings, which are all under way, have as their purpose the fixing of just and reasonable rates for about 75 percent of the gas flowing in interstate commerce.

277,577

— 11 —

LEGAL BASIS FOR AREA RATES

In the second *Phillips* case (*Wisconsin* v. *F.P.C.*, 373 U.S. 294 (1963)) the Supreme Court, in holding that the Commission had not abused its discretion by rejecting the individual company approach, stated (pp. 308-309):

> * * * If we believed that such a departure from present concepts had little, if any, chance of being sustained, we would be hard pressed to say that the Commission had not abused its discretion in terminating this §5(a) proceeding while undertaking the area experiment. For if area regulation were

almost sure to fail, and if the individual company cost-of-service method of determining the reasonableness of rates had been abandoned, then there would be virtually no foreseeable prospect of effective regulation.* * *

But to declare that a particular method of rate regulation is so sanctified as to make it highly unlikely that any other method could be sustained would be wholly out of keeping with this Court's consistent and clearly articulated approach to the question of the Commission's powers to regulate rates * * *

More specifically, the Court has never held that the individual company cost-of-service method is a *sine qua non* of natural gas regulation.

A number of producers contend nevertheless that we are pursuing an inherently illegal method of regulating the field price of natural gas. Sun, in particular, has been vigorous in asserting that the Natural Gas Act precludes us from fixing maximum area prices at a level lower than a producer could justify on an individual cost-of-service basis.

277,578

— 12 —

Sections 4 and 5(a) of the Natural Gas Act provide the authority for regulating the rates of the producers upon which the area rate order is based, but the breadth of the statutory scheme is evidenced also by the other

provisions of the Act which confer broad regulatory authority over sales for resale by gas producers in interstate commerce. For example, Section 7 of the Act requires every producer to obtain a certificate of public convenience and necessity prior to commencing any interstate sale and also requires Commission approval before abandonment of any gas which has been dedicated to the interstate market. Section 16 of the Act empowers the Commission "to perform any and all acts and to prescribe, issue, make, amend and rescind such orders, rules and regulations as it may find necessary or appropriate to carry out the provisions of this Act."

This area rate proceeding includes numerous individual rate increase filings in the Permian Basin which have been suspended. The rates specified in the filings have been collected subject to refund under the provisions of Section 4 of the Act, requiring that all rates shall be "just and reasonable." The area rate order will also apply under Section 5(a) of the Act to those sales of the respondents in the Permian Basin which are not being collected subject to refund. Section 5(a) contains the statutory standard for fixing the future rates for the sales in the area since its provisions are also applicable to rates fixed under Section 4. Section 5(a) provides that:

> Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or

collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and

reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: PROVIDED, HOWEVER, That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural-gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural-gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

While Section 4 of the Act prescribes that "all rates and charges" by *any* natural gas company shall be "just and reasonable", there is nothing in the Act which states or suggests that the justness and reasonableness of a particular company's rates cannot be determined on a group or area basis, rather than in a separate proceeding for

each company. Operating under a statute with virtually the same rate-making provisions as the Natural Gas Act, the Secretary of Agriculture, with the approval of the United States Supreme Court, has long fixed maximum just and reasonable rates for all stockyard marketing agencies of a particular yard, based on stockyard-wide data, rather than individual rates based on the costs of individual agencies. See *Tagg Bros.* v. *United States,* 280 U.S. 420 (1930); *Acker* v. *United States,* 298 U.S. 426 (1936); *United States* v. *Corrick,* 298 U.S. 435 (1936). The Federal Communications Commission, also operating under similar statutory commands, has for a number of years fixed the maximum just and reasonable rates for the competing international telegraph common carriers on a "bell-wether" basis, refusing, in the interests of its statutory mandate of providing the public with "adequate facilities at reasonable charges" (47 U.S.C. 151), to fix the rates "so that all carriers engaged therein may earn a fair return on the fair value of their property devoted to that service or even make some profit on their operations." *Postal Telegraph-Cable Co., et al.,* 5 FCC 524, 527 (1938). See also *The Western Union Telegraph Co.,* 25 FCC 535, 577-580 (1958).

Another example is action fixing a uniform price for milk in a milkshed, a form of regulation which was upheld in the landmark case of *Nebbia* v. *New York,* 291 U.S. 502 (1934). See *United States* v. *Rock Royal Co-op.,*

307 U.S. 533 (1939) (upholding Federal milk marketing orders under the Agricultural Marketing Agreement Act of 1937, 50 Stat. 246); *Sunshine Anthracite Coal Co.* v. *Adkins,* 310 U.S. 381 (1940) (upholding Bituminous Coal Act of 1937, 49 Stat. 991, authorizing Bituminous Coal Commission to impose maximum and minimum prices on an area basis). For the regulation of railroad charges the Interstate Commerce Commission has employed territorial classifications and group rates. *New York* v. *United States,* 331 U.S. 284 (1947); see also *Ayrshire Collieries Corp.* v. *United States,* 335 U.S. 573 (1949).

It is thus well established that governmental price regulation of services and commodities can be lawfully exercised over industries providing commodities or services on a group or geographical area basis. Many different regulating authorities with jurisdiction over an entire industry or common group have been upheld in exercising their rate-making authority on a group basis rather than conducting separate proceedings for each individual company. Moreover, with special reference to rate regulation under the Natural Gas Act, the Supreme Court has long held that neither the Constitution (see *F.P.C.* v. *Natural Gas Pipeline Co.,* 315 U.S. 575, 586 (1942)) nor the Act itself imposes any special "formula by which the 'just and reasonable rate' is to be determined." *F.P.C.* v. *Hope Natural Gas Co.,* 320 U.S. 591, 600 (1944). See also *Colorado Interstate Gas Co.* v. *F.P.C.,* 324 U.S. 581 (1945).

(277,580

The argument to the contrary stems primarily from a brief dictum in *Bowles* v. *Willingham*, 321 U.S. 503 (1944) in which the Court, in the course of upholding the lawfulness of war-time rent control legislation authorizing the Price Administration to fix, without advance hearing, maximum rents that were "generally fair and

277,581

equitable", referred to the then recent *Hope* case for the proposition that "under other price-fixing statutes such as the Natural Gas Act * * * Congress has provided for the fixing of rates which are just and reasonable in their application to particular persons or companies" (*id.* at 517). It is significant that this statement predates the first *Phillips* case and its determination of the existence of Commission authority over producer rates. At the time of the Court's statement in the *Bowles* case, the Commission had not yet undertaken a program for producer regulation and was, as it still is, regulating pipelines under individual company cost-of-service procedures. The Court's dictum contrasting group regulation under the rent control statute with the individual company regulation of pipelines cannot be interpreted to suggest that the latter would be the sole appropriate method of determining rates under the Act for producers whose business involves entirely different economic and administrative problems. On the contrary, the Court went on to state that "considerations of feasibility and practicality are certainly germane to the constitutional issue [of group

versus individual company pricing]" (*id.*), that *Hope* had indicated that "price control, the same as other forms of regulation, may reduce the value of the property regulated" (*id.*), and that though "high cost operators may be more seriously affected by price control than others * * * it has never been thought that price-fixing, otherwise valid, was improper because it was on a class rather than an individual basis" (*id.* at 518).

Both the constitutional and the statutory questions, in other words, are not to be decided abstractly, but rather in the light of the nature of the specific rate-making problem involved, and of what is required to achieve a sensible result. The necessity for accommodating the system of regulation to the circumstances of the industry being regulated was recognized by the Supreme Court in the *Nebbia* case, *supra,* in which it was held that due process under the Fifth and Fourteenth

Amendments demand only that government regulation "shall not be unreasonable, abritrary or capricious, and that the means selected shall have a real and substantial relation to the object sought to be attained" (P. 525). In the words of the Supreme Court in *Hope, supra,* at p. 602 "Under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling."

We believe the area approach should be adopted because it is well adapted to the economic facts of the

industry and the practical administrative problems of carrying out the primary purpose of the Act, which is to achieve effective price control. We remain of the view, originally set forth in our *Phillips* decision in 1960 (24 FPC at 547), that the area approach will enable us to carry out our ultimate objective of setting prices in all producing areas.

Basic to this determination is the fact that objective cost standards for fixing just and reasonable rates for producer sales can best be developed by examining overall producer experience. An individual producer may find only dry holes or marginal wells on his search for gas may result in finding a huge new gas field. A price fixed by his individual cost experience could thus either be too high for consumers in relation to other available supplies or too low to be fair to the producer, considering his risks. However, on a group basis, costs and rates can be developed which will be fair to all concerned. A uniform ceiling price for the area will provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur.

277,583

— 17 —

A uniform area pricing system is adapted to the economics of the natural gas industry. The producer who finds large reserves will achieve greater profits than the producer whose exploration efforts result in dry holes or marginal wells. Likewise, the producer whose enterprise is conducted with efficiency and economy will make

more money than the producer who runs his business poorly. There is a strong incentive in area pricing to prudence and economy which does not exist in individual company cost-plus pricing in an industry where individual cost norms are difficult to determine and apply. True, individual returns will vary greatly, but this is as it should be, provided that profits in the aggregate are at a reasonable level.

The area regulatory pattern thus conforms to the characteristics of an industry which, as much as any, is one where there is scope for greater or lesser reward as dictated by the results of exploratory efforts. The area price will give producers the incentive they need to explore to meet the nation's increasing demand for natural gas and yet give consumers the protection which the Act intended.

An obvious advantage of the area rate approach which is of great importance is that it enables the Commission to determine in a single proceeding rates which would otherwise require hundreds of individual rate cases. It will thus eliminate the administrative bottleneck of company-by-company determinations. As we have noted, the four area proceedings now under way will complete the task for 75 percent of the gas flowing in interstate commerce in the entire nation.

277,584

— 18 —

The individual company approach would also result in a wide variety of rates in a single field, and even for

the sales by co-owners from a single well, depending on their varying company-wide costs. Such a system would raise staggering burdens of administration. Administrative feasibility is a vital element in the effectiveness of any method of regulation and our experience dictates that it should be given great weight in assessing the validity of the area approach.

The cases do not support the producers' contention that a just and reasonable rate fixed on the basis of the overall costs and profits of the producers in the area would be constitutionally confiscatory as to any respondent who could support a higher price on an individual company cost-of-service basis. The Supreme Court in *Acker* v. *United States,* 298 U.S. 426 (1936) rejected the argument that the pricing orders of the Secretary of Agriculture, fixed on a group basis under the Packers and Stockyards Act, were confiscatory as to a particular market agency, concluding that "in ascertaining a reasonable unit cost as the basis of a uniform rate the Secretary was not bound to, and indeed he could not, adopt any one [market] agency's costs" (*id.* at 429) and that "regulation cannot be frustrated by a requirement that the rate be made to compensate extravagant or unnecessary costs" (*id.* at 431). See also *Tagg Bros.* v. *United States,* 29 F. 2d 750, affirmed *Tagg Bros. v. United States,* 280 U.S. 420 ("It is not incumbent upon the Secretary to fix the rates so high that all agencies in the business would make money whether they did a substantial business or not."); *Bowles* v. *Willingham, supra;* and *Aetna Insurance Co.* v. *Hyde,* 275 U.S. 440 (1928).

In the *Aetna* case rates of all the stock fire insurance companies doing business in Missouri had been reduced by the superintendent of insurance under a statute authorizing him to limit the rates charged so that the "aggregate collections" by all the companies would not exceed a reasonable rate. The superintendent reduced the rates uniformly and on appeal by the companies involved the Supreme Court concluded that the Fourteenth Amendment was not violated merely because the aggregate collections were not sufficient "to yield a reasonable profit or just compensation to all companies that happen to be engaged in the affected business." (p. 447)

Even in situations where it is appropriate to fix rates on an individual company basis, the courts have held that a company's rates may be fixed at a level below that which would be justified on a normal cost-of-service basis, where the low rates result from self-imposed contractual limitations. (See *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1955)) In an analogous situation, it was early held that a turnpike was not entitled to higher tolls on the basis of cost-of-service evidence where the real problem was the low volume of traffic (Covington & Lexington Turnpike Road Company v. Sandford, 164 U.S. 518 (1896)).

These cases make clear that there is no constitutional infirmity in the statutory authority to fix just and reasonable rates on an area basis, and argue persuasively that

in group ratemaking individual costs cannot be controlling. To hold otherwise would convert a proceeding to control prices into one that merely established a minimum rate above which every producer would be free to justify an above-ceiling rate in an individual company determination. A procedure under which the area rate would become a floor rather than a celing would destroy the area rate concept as an effective means of regulation. Such an approach to our consumer protection responsibilities under the Natural Gas Act would be neither just nor reasonable.

While we will not permit a back-door approach to individual cost-of-service under the guise of avoiding confiscation, there may well be circumstances in which a producer would be entitled to relief from his obligation to continue to render service to the public at the area rate or to make refunds for past periods. Accordingly we shall provide an opportunity for producers to petition

for special relief from the area rate as set forth in detail at pages 104-107. We cannot here visualize all of the circumstances which may serve as the basis for such relief, and will provide adequate flexibility to consider claims to such entitlement, but it is obvious that more must be shown than that the individual producer's costs exceed composite costs.

We believe the record in this case, judged in light of our experience in administering the Natural Gas Act,

clearly supports the conclusion that the area approach offers a regulatory method which is best adapted to the discharge of our responsibilities for protecting natural gas consumers while providing the greatest incentive to producers to continue their search for needed additions to our gas supply.

CONTRACT PRICES AS A BASIS FOR REGULATION

In considering the appropriate guidelines for regulating producer rates on an area basis, we must dispose of one threshold argument. Certain of the producers contend that their contract prices should be approved as meeting statutory requirements because they have been reached as a result of what is termed effective competition. IPAA contends that the examiner erred in not adopting as the standard for determining area prices the "market value" as established by natural gas purchase contracts negotiated at arm's length. A number of other producers propose a slightly more sophisticated version of this argument under which the contract rates negotiated at arm's length would be allowed to govern as long as the ratio of proven reserves to production did not become inordinately high.

We recognize that the history of negotiated prices in the area is an important element to be considered in reaching our decision. However, the producers' contention that the Commission should simply validate their negotiated prices, if accepted, would amount to an abdication of our regulatory responsibility.

The essential difficulty with the contract price argument is that there is nothing in this record which would justify a conclusion that reliance on contract prices unrelated to cost will "afford consumers a complete, permanent and effective bond of protection from excessive

rates and charges", which is the purpose of the Act in prescribing that the rates and charges to consumers of natural gas should be just and reasonable. *Atlantic Refining Co.* v. *Public Service Commission of New York (CATCO)*, 360 U.S. 378, 388 (1959). See *Wisconsin* v. *Federal Power Commission*, 373 U.S. 294, 309-310 (1963). *Phillips Petroleum Co.* v. *Wisconsin*, 347 U.S. 672, 685 (1954). There are admittedly many producers selling gas to the interstate pipelines both in the nation as a whole and the Permian Basin in particular, but nothing in this record suggests that any competition among them in making sales to the pipelines is in any way adequate to assure that the public will secure gas at just and reasonable prices in the absence of regulation.

The history of price negotiations in the Permian Basin area is relevant to this issue. When El Paso was granted a certificate to supply natural gas to the California market on May 31, 1946, 5 FPC 115 (1946), it had entered into contracts with Phillips, Gulf, Shell, and Warren for a supply of gas in the Permian Basin. El Paso was to pay to Phillips 3.5 cents per Mcf, Shell and Warren 3.0 cents,

and Gulf 4.0 cents. These prices were subject to escalation by one cent every few years and to spiral escalation clauses by which they would be adjusted upward if El Paso's resale rates increased at the California border. Later, the spiral escalation clauses were deleted and indefinite favored-nation escalation clauses were substituted, except in the case of Phillips.[15]

In 1953, the Commission certificated Permian Basin Pipeline Company (a subsidiary of Northern Natural, and since merged into it).[16] The initial price amounted to approximately ten cents per Mcf for pipeline quality gas and was subject to escalation of one cent every five years.

In 1959, Transwestern Pipeline Company, 22 FPC 391 (1959), obtained a certificate to build a new pipeline from the Panhandle-Hugoton area of Texas and Oklahoma and from the Permian Basin to California. For the producers supplying gas to the pipeline the Commission authorized 16-cent prices and one 18-cent price, but the contracts called for prices as high as 21.8 cents in the West Texas-Permian area and 23.0 cents in the Panhandle-Hugoton area.

---

[15] A favored-nation clause in a contract generally provides that the contract price shall be increased to equal higher prices paid others in a given area. There are numerous variations of the basic concept. Spiral escalation clauses are also indefinite in amount and provide for increases in producer rates in proportion to increases in the rates of the pipelines that are purchasing the gas from the producer.

[16] *Permian Basin Pipeline Co.*, 12 FPC 85 (1953).

The escalation clauses in the contracts and the urgent pipeline requirements for large volume gas reserves contributed to a continuous rise in Permian Basin prices. As a result of these escalation clauses and the expanding need for gas the 2.8-cent per Mcf average price paid by El Paso in 1947, its first full year of purchases, increased to 9.0 cents in 1954, the year of the first *Phillips* case, and reached 13.8 cents per Mcf in 1960. In that year, El Paso renegotiated most of its Permian contracts to eliminate the indefinite price clauses but was required to agree to price increases. The new prices ranged from 13.5 cents per Mcf to 17 cents per Mcf for gas of high quality.

We do not suggest that this historical pricing pattern in and of itself demonstrates the invalidity of the contract prices now in effect in the Permian Basin. On the contrary, it is obvious that the extremely low prices prevalent during the earlier period of large oil-associated supply and small demand bear no relationship to the cost of exploring for and producing gas even in that period, to say nothing of the present. However, while the record indicates that the costs of the various producers in the field differ markedly, there is no evidence that any significant volumes of gas of similar quality have ever been offered for sale at prices which reflect these cost differences.

The pipelines are far from being in a bargaining position which would validate the theory that a market price

will necessarily be a just and reasonable price. On the contrary the entire history of pipeline purchasing activity, since the end of the El Paso monopoly in the Permian Basin, has been characterized by the overriding needs of the pipelines to contract for the large blocks of uncommitted reserves essential to maintain their competitive position in developing markets (see *United States* v. *El Paso Natural Gas Co.*, 376 U.S. 651 (1964) and their inability to accomplish this objective except at ever increasing prices. The abstention of the pipelines from these proceedings does not indicate that any significant change can be expected in the future. The fact that many pipelines are themselves producers with an interest in generally higher producer prices also cannot be overlooked.

277,589

— 23 —

There is no basis for concluding that there would be any effective producer price competition even if the pipelines were in a position to encourage it actively. On the contrary, until action was taken by this Commission, the entire pattern of producer contracts in Permian was on a basis of favored-nation and spiral escalation contracts calculated to assure that all producers would be treated alike and receive the highest going price both at the time of the contract and in the future. Typically, where a large producer has been able to command a higher price for a big block of gas needed by a pipeline entering the market or preparing for a major expansion,

this has had the effect of raising the price to all other purchasers by all other sellers big and small, and regardless of their costs or profit ratios. Moreover it is obvious that a key factual question in determining whether there is effective competition is the amount of uncommitted reserves controlled by the large producers. The pattern of sales and annual deliveries in the Permian Basin strongly suggests that a limited number of producers control a large percentage of the gas reserves,[17] and it is significant that the producers in the exclusive possession of the facts have made no showing to rebut this conclusion.

In *United Gas Improvement Co.* v. *F.P.C.*, 290 F.2d 133, 135 (CA5, 1961), certiorari denied 368 U.S. 823 (1961), it was said that the supply of gas controlled by the producers is so restricted in relation to demand that they have economic power to bargain for prices that will be injurious to the public. The Court held that the Commission in exercising its authority may not act merely upon proof that the prices in question were arrived at as a result of arm's-length negotiation, but must look behind the negotiated price. See also *P.S.C. of New York* v. *F.P.C.*, 287 F.2d 146 (CADC, 1961), *United Gas Improvement Co.* v. *F.P.C.*, 287 F.2d 159 (CA10, 1960). In so holding the court was reiterating the position it had taken in a series of cases involving just and reasonable

[17] The record reveals that 5 producers account for about one-half of the jurisdictional sales in the Permian Basin and 15 producers make about three-fourths of all the sales of gas in the area.

rates for independent producers under Section 4 of the Act in which it had concluded that:

> * * * evidence of unregulated prices in the field is not sufficient to warrant a finding by the Commission that a price comparable to them is just and reasonable within the

> intendment of the Natural Gas Act. Neither is evidence of the field price when coupled with the opinion of experts that the price must be high enough to provide an incentive for exploration and development of new sources of supply."[18]

If there is a case to be made for effective competition among producers in establishing just and reasonable rates it has not been made on this record. There is no evidence of competition between producers to make new sales by offering lower prices. On the contrary, the primary competition revealed by the record was among the pipelines to secure new gas supplies at higher prices. Whatever the

---

[18] *Bel Oil Corp.* v. *F.P.C.*, 255 F. 2d 548, 553 (CA5, 1958) certiorari denied, 358 U.S. 804. See *Forest Oil Corp.* v. *F.P.C.*, 263 F. 2d 622 (CA5, 1959); cf. *City of Detroit, supra.* As the court indicated in the *Bel Oil* case the expert testimony purported to show that petitioners "did not possess any dominating position in the industry, that natural gas is competitive with other non-regulated fuels, that the proposed prices were comparable with unregulated prices for local consumption; that maintenance of such a price is necessary to provide appropriate incentives for exploration and production of natural gas in Louisiana." (p. 551)

degree of competition which may exist among producers it has not been effective to afford gas consumers the protection to which they are entitled under the Natural Gas Act. Under these circumstances, there is no basis for assuming that prices which "have leaped from one plateau to the higher levels of another" will constitute a level which will be "the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest." *Catco, supra,* at pages 391, 388.[19]

It is thus clear that our examination of the contract prices of the gas producers is only the beginning and not the end of our task in establishing the proper criteria for determining just and reasonable rates.

277,591

— 25 —

RESERVES TO PRODUCTION RATIO AS A REGULATORY STANDARD

The producers contend that the gas supply situation is so critical that any significant limitation on contract prices would necessarily result in a dampening of essential exploration and development activity. In major part this argument resolves around the controversy as to the declining reserves to production ratio (R/P ratio) in the gas industry. This ratio has been as high as 32.5 to 1 in

---

[19] As the Supreme Court pointed out in the *Catco* case, *supra* (at p. 388, footnote 7), this "declaration of which stems from the original version of Section 7 of the Act, was not intended to be changed by the 1942 amendment to the Act, which omitted that provision.

1946 and it has steadily declined to about 18,7 to 1 in 1963, based upon the reserve figures provided by the American Gas Association and the American Petroleum Institute.[20]

The producers suggest that the reserves to production ratio should be the barometer by which the Commission is guided in setting any limitations upon the producers' contract prices and specifically that no such limitation should be imposed if the R/P ratio is not at least 20 to 1. Alternatively, they argue that, even if the Commission were to adopt the 17.5 to 1 ratio which the examiner believed was a reasonable target for 1970, present trends indicate that a lower ratio will be reached by that date; and they argue further that fixing area ceilings below existing contract prices would act as a brake on producer investment in gas exploration and development, and would therefore be contrary to the public interest.

In evaluating the producers' argument we must first analyze the forces which have determined the overall level of exploration and development by producers in the Permian basin and elsewhere. The overwhelming fact which emerges from this record is that the vast increase in exploration and development of gas supplies which has taken place in the last two decades has resulted from the development of a system of interstate pipelines which has created an ever increasing nationwide market for gas. In short, the producers have stepped up their

---

[20] The 1964 statistics available after the record was closed revise the R/P ratio for 1963 to 19.0 to 1 and reveal that the ratio in 1964 was 18.3 to 1.

exploration and development activity because a market had been created for their product, even though during most of this period the prices have been far lower than fully allocated costs as determined herein.

277,592

— 26 —

We agree with the examiner that the emergence of directionality, *i.e.*, the ability of producers to direct their drilling activities toward either oil or gas, brings into being for the first time an opportunity for price to play a significant role in increasing the supply of gas-well gas available to the interstate market. We have reflected this fact in the system of ceiling prices which we are adopting because, in our opinion, the true benefits of directionality can be best achieved through a two-price system which, though based on costs, by its very nature provides a special inducement for exploration for gas-well gas. Such a system should permit price to play its full role in eliciting needed gas supplies. To permit still higher prices would only create windfalls for the producers with no assurance of any concomitant consumer benefits.

We agree that a strong exploration program which will discover and develop gas reserves in ample time to meet the increasing demands of gas is vital. Any method of fixing just and reasonable prices must take this into account. However, there is no reason to assume that there is a direct relationship between any calculated R/P ratio and the price of gas. On the contrary, the R/P ratio went steadily down during the periods in

which gas prices were staging their most spectacular increases. It seems clear that even an exploratory program which will continue to add substantially more reserves annually than are produced is almost certain to fall short of preventing a further decline in R/P ratios.

As long ago as 1957, the AGA in *Gas Facts,* 1957 edition, page 6, stated that the industry should not be preoccupied with a "hypothetical" reserves to production ratio, but should focus its concern on finding sufficient gas to replace that consumed each year. There is considerable doubt that it is desirable, from the point of view of the public or the industry, to require or encourage a high level of proven reserves many years in advance of their probable use. It is an extremely costly matter to find and hold reserves beyond those which are needed to

assure ample supplies to consumers. The Commission's recent action in allowing exceptions to the 12-year minimum deliverability rule was a limited step in recognition of this fact.[21]

---

[21] Order No. 279, 18 C.F.R. 2.61, 260.7; issued March 31, 1964, prescribing the filing of annual reports by pipelines to furnish information with respect to total gas supply and deliverability stated, "* * * information from the reports will make it possible to relax the Commission's 12-year deliverability life requirement where the information supplied by the pipeline company indicates it has an active procurement program, its system extends into production areas with continuous exploration and the results thereof indicate continuing ability to meet gas requirements."

There is also serious question as to the reliance to be placed on the available R/P ratio figures. The proven reserve figures are admittedly conservative. The amount of proven gas reserves added each year depends more upon revisions of former reserve estimates which have varied widely than upon new findings. The true ratio of reserves to production is undoubtedly higher at the present time than would appear from available statistics.

For all these reasons, we believe it would be doubtful wisdom for this Commission to attempt here to fix the minimum appropriate level of reserves for the industry, and particularly we think that it would be unwise as well as futile for us to attempt to gear our pricing policies towards maintaining a reserves to production ratio of 17.5 to 1 or higher. The ratio has already declined very close to that point, and it will probably decline further regardless of the price of gas set by this Commission. Such a decline is the inevitable result of increases in consumption on the scale that we have witnessed in the past decade. Under these circumstances, any attempt to maintain a specific ratio of reserves to production by permitting interstate prices to reach their maximum contract level would be much more likely to affect adversely the market for gas than to induce substantially greater supplies.

The impracticability for the long term of attempting to maintain indefinitely a 17.5 to 1 ratio may be demonstrated by some simple figures. It is estimated that by 1980 natural gas use, already more than 15 trillion cubic feet a year, will have grown to 25 or more trillion and by

the year 2,000 annual use can be expected to exceed 30 trillion. This level of use at the specified ratio would require reserves of 525 trillion cubic feet. By that date we shall have used some 900 trillion cubic feet of gas now in the ground, which would mean a total of some 1400 trillion cubic feet would have been found. This is in the middle of the range of responsible estimates of the total gas found and to be found in the United States.

That the reserves ratio will decline is not necessarily a cause for concern for many years to come. The high ratios of the past were not a result of design or of business prudence, but resulted rather from lack of a market for the immense reserves discovered in the search for oil. In such circumstances the imposing reserve ratios of the past have little significance. With the intensive post-war development of the natural gas market we are witnessing an adjustment of the reserve ratio to economic levels.

While the adequacy of reserves is an important factor in our determination here, and will continue to be an important factor in reviewing area rates in the future, we cannot accept the producers' position that the maintenance of a particular R/P ratio justifies the existing and future contract prices, whatever they may be.

THE TWO-PRICE SYSTEM

The presiding examiner at pages 12-38 of his opinion presents a persuasive discussion of the "Economic and

Institutional Factors Which Govern the Method of Establishing Area Rates."

The touchstone of the presiding examiner's decision is his conclusion that the industry is increasingly becoming able to direct its exploration efforts toward finding new gas-well gas as distinguished from finding gas as a by-product in the search for oil. This newly documented ability of the industry to channel its exploration investment toward either gas or oil serves as the basis for a pricing system, which we here adopt, that will make use of the economic drive of the industry in order to bring needed gas supplies to consumers at the lowest reasonable price.

The Commission's staff and some of the interveners argue that even if some companies can effectively direct their exploratory activities toward gas, it has not been shown that all of the Permian Basin producers can do so. In making this argument special reliance is placed upon testimony to the effect that small producers do not have the resources necessary for effective directional exploration.

We have considered the evidence presented and we conclude, as did the examiner, that the larger producers in the industry have shown an increasing ability to direct their drilling activities toward either gas or oil, as they desire. Large producers maintain geological staffs and extensive files of geological information upon which the

necessary predictions can be based. While small producers, may lack the capital to maintain the organizations necessary for effective prediction, they often drill on lands obtained on farmouts from larger producers and thereby obtain the benefit of the geological knowledge required for directional drilling. To this extent it appears that even small producers are often able to drill with some assurance as to what they may expect to find.

In agreeing with the examiner's finding on directional drilling we do not mean to suggest that all exploration and development activity by producers is based upon reliable predictions as to what if anything will be found. What we do say is that on this record a major portion of the industry operating in the Permian Basin in recent years has demonstrated the ability by directional drilling to increase the known supply of gas, provided that the regulated price and the demand for gas justifies such an investment. Looking to the future we are establishing a pricing system that will encourage the industry to expand and perfect its ability to drill directionally so that revenues from gas consumers can increasingly be devoted to finding additional gas reserves.

In referring to the incentive provided by the ceiling for "new" gas-well gas we are not providing any special, isolated amount as a separately designated incentive. The inducement to be found in the "new" gas price is of an inherent nature and is not represented by any sum ear-marked for that purpose. The incentive is built into the two-price system. It provides a price for the future related to current and future costs and payable only to

producers who discover gas-well gas and dedicate their discoveries to the interstate market.

A single price based on an average of historical and current costs could not provide the same incentive to explore for gas in the future even if it yielded the same

revenue. A single price based on future costs will result in windfalls to those producers who acquired and sold gas under lower cost conditions. The two-price system thus holds out a reward to encourage producers to engage in further exploration and development while preventing excess and unnecessary revenues from the sale of gas developed at a period when there was no special exploratory activity directed to gas discovery.

The producers favor a single price and the arguments they make are aimed at obtaining the "new" gas price as the one price to be applied to all gas. We disagree. If a one-price system were to be adopted, average historical costs — not the higher current costs — would necessarily serve as its foundation, and we have no assurance that such a price would elicit the investments at current cost levels which are needed to bring forth adequate new supplies of gas-well gas.

The producers support a contention for a single price based on current costs with the argument that current revenues provide financial support for current exploration and development. Assuming *arguendo* the factual

basis for the argument, this is not an acceptable reason for "flowing gas"[22] being the beneficiary of "new" gas-well gas prices. The producers' inducement to engage in further exploration and development directed toward gas comes from the knowledge that future gas supplies will receive a price which provides adequate compensation. Of course the availability of funds to seek new sources of supply is a factor to be considered in the fixing of all prices, and we have not overlooked this factor in the determination of the "flowing" gas price. It does not follow that a single price for all gas is required. On the contrary, as already stated, if such a ceiling were fixed high enough to elicit new gas-well gas supplies it would result in windfall profits for all other gas and if fixed low enough to reflect costs for old gas it would not assure adequate supplies for the future.

277,597

— 31 —

The record in this case was augmented by the econometric studies introduced by the staff and a rebuttal showing by the producers. These studies are, as the examiner stated, truly pioneering endeavors. The studies were not designed to support a specific rate recommendation or rate design but served to focus attention upon the important role of market demand among the considerations relevant to our decisions. The studies indicate that ad-

---

[22] The term "flowing gas" in this opinion will be used to include old gas-well gas, oil-well gas and residue gas as explained in detail at pages 78-80, *infra*.

vanced statistical and mathematical techniques can be useful in understanding the interaction of the price of gas at the wellhead and the demand in the marketplace.

The econometric studies in this case were based on the assumption of a one-price system and as noted by the examiner, "on a non-directional hypothesis." The quantitative results of the studies therefore cannot be relied upon in this case although the studies tend to support our conclusion that a two-price system is necessary and desirable to make positive use of the interaction of price and gas supply.

It has been suggested that providing a separate ceiling for new gas-well gas may retard the search for gas by inhibiting demand, on the theory that high prices may price gas out of some markets. This argument may have some merit as an abstract proposition but it misses the mark when applied to the facts of this case. We are not here fixing a ceiling that will increase prices but rather one to reduce unreasonably high prices and stabilize field prices generally. Furthermore while fixing a higher ceiling for new gas-well gas (including residue gas derived therefrom) we are also fixing a lower ceiling for all other gas. Certainly the ceiling prices fixed herein which will stabilize gas prices that have been increasing in the past cannot be a basis for predicting a declining market.

Some who opposed the examiner's price strúcture also argue that no need to encourage a stepped-up search for additional reserves at this time has been shown. It is pointed out that on a nationwide basis the AGA figures on proven reserves show that more gas has been found each

year than was consumed, even though the reserve ratio as computed by AGA has been declining. It is also argued that we must take into account increasing discoveries of gas in Canada and Mexico as well as the possibility that technology may make new sources of energy available to supplement gas long before present reserves are exhausted.

It is beyond dispute that continuing exploration and development of new gas reserves is necessary in the public interest. The only question is the proper scale of the necessary effort. In the absence of a regulatory pattern which offers encouragement for the search for gas there is no guarantee that the present generally satisfactory pace of exploration will continue, much less increase to meet growing demands. New gas discoveries are the lifeblood of the industry and are also essential to consumers who are tied to natural gas. This Commission cannot discharge its responsibilities to the public by relying on unsupported suggestions that gas supplies from distant sources or other forms of energy will suffice to meet an obvious need for new gas supplies to serve the needs of the pipelines and of their consumers who are tied to the use of this fuel by large investments in gas utilization equipment.

In the past the greater part of the gas in the Permian Basin was found in the course of searching for oil but, as the examiner found, in recent years there has been a decline in drilling for oil. The future needs of the gas

market can no longer be satisfied by the incidental discoveries in the search for oil. Accordingly, there will be a greater dependence on exploring for gas wells to bring forth needed gas supplies in the future and this fact supports our conclusion to fix a higher ceiling for new gas-well gas which will encourage exploration at deeper horizons directed toward finding gas.

The separate price we fix herein for new gas-well gas in the Permian Basin should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies. In order to assure that every effort

will be made by producers to bring in new gas-well gas we also state our conviction that the ceiling set in this proceeding should continue to apply to all such new gas dedicated within the ceiling fixed herein even if in any later review of the area rate for the Permian Basin the evidence indicates that a lower price would be justified for future discoveries. We cannot bind the Commission for the future, but we state our view that any lower ceiling should apply only to new gas dedicated after the ceiling price may have been subsequently reduced.

On the basis of the record made in this proceeding and after careful consideration of the arguments against the examiner's findings on these points we conclude that there is substantial support for pricing new gas-well gas at a higher level in order to encourage the search for new gas reserves at minimum overall cost to consumers.

THE DATE OF DIVISION BETWEEN NEW GAS-WELL GAS AND OLD GAS-WELL GAS

The presiding examiner fixed December 23, 1960, the date this proceeding was initiated, as the date dividing new gas-well gas from old gas-well gas. Gas moving under contracts filed with the Commission before December 23, 1960, would be classified as old gas; gas moving under contracts filed on or after that date would be new gas. Staff has advocated a division date of January 1, 1961, which would offer the administrative convenience of making the division at the beginning of the calendar year. The California Distributors urge that the new gas price should be effective only as to gas moving under contracts filed after the conclusion of this proceeding. They argue that any incentive element included in a higher price for new gas can fulfill its purpose only with respect to gas dedicated to interstate commerce after the conclusion of this proceeding. The Major Producer Group, on the other hand, would apply the new gas price to all gas moving under contracts dated after June 7, 1954, the date when regulation of natural gas producers commenced.

The argument that a two-price system should have a 1954 breaking date is weak. The essential justification for the dual price system is that with the recent development of directionality there is for the first time a basis for believing that gas exploration and development activi-

ties may be responsive to price. To apply a price based upon the present cost of finding and developing gas-well gas to such gas (to say nothing of casinghead and residue gas derived therefrom) developed before the era of directionality would be inconsistent with the rationale of our decision and bestow a windfall on the producers.

There is more plausibility to intervener's argument that the cut-off date between new gas and old gas should be the effective date of this decision. We agree with the examiner, however, that the proper breaking point should be at or near the end of 1960. As indicated *infra*, our price for flowing gas including old gas-well gas is being fixed primarily on the historical cost-of-service for this case as derived from the respondents' cost data supplied in response to the Commission inquiry. The test year for such data is 1960. Moreover, while the new gas-well gas ceiling is based on current rather than historical costs, the record indicates that directionality upon which the two-price system is based first became significant about 1960, and that costs have remained constant since that time.

There is another reason why we believe that a date approximating that fixed by the examiner is in the public interest. In effect, the two-price system which we have now prescribed was established for Permian and many other pricing areas in the adoption of our dual guideline ceilings by the September 28, 1960, Statement of Policy. Our pricing policy has given different treatment to gas dedicated since that date than to older gas. The expectations of producers which would presumably result from

this policy of the Commission are thus consistent with the cost of considerations referred to above.

277,601

— 35 —

The specific date for distinguishing between old and new gas-well gas presents, we believe, primarily an administrative problem. The examiner suggested December 23, 1960, the date of the institution of the Permian proceeding, but this would imply that the old gas/new gas breaking point in the various areas should depend upon when the particular area case was initiated — a date which has no necessary relationship to any of the considerations referred to above. It has been suggested that the September 28, 1960, date on which we issued the Phillips decision and the statement of policy should be utilized. However, our decision therein could hardly have had any such instant effect upon contract negotiations, to say, nothing of the effect upon exploratory activity. Moreover, using September 28, 1960, as the dividing point would mean that some of the gas sold in the test year and used for determining old gas mixes would receive new gas treatment. We think that, all things considered, it would make more sense to set the dividing line as of the end of the 1960 test year. Accordingly, the new gas ceiling will be made effective for contracts entered into on or after January 1, 1961.

BASIC STANDARD FOR NEW GAS-WELL GAS CEILING PRICE

It becomes necessary at this point to define gas-well gas with more particularity. By gas-well gas we mean so-called nonassociated gas, that is, gas from dry gas reservoirs and gas condensate reservoirs, and gas from gas-cap wells.[23] Within these definitions the classification of gas wells by the appropriate state agency will be accepted for purposes of this decision in the absence of a showing that it is not a reasonable classification for pricing purposes. The definition of all other gas will be discussed *infra* at pages 70 and 75.

Except for those parties who advocate existing contract prices as the primary regulatory standard, all parties recognize that costs must be a major factor in determining the area price. If the area rate approach is to rest on a solid foundation there must be an objective test by which the industry, the consumers and the courts can appraise the fairness of the price we fix. We are convinced that a composite cost determination is the bedrock on which a regulated price must be established. The issue

[23] Gas-cap gas is a special category of gas from an oil reservoir that can be produced free from the influence of oil production. As a practical matter state classification of the small amount of gas in this category in the Permian Basin makes it reasonable to include gas-cap gas in the category of gas-well gas. If production of gas-cap is governed by allowables set for oil by the state agency, it will not be considered gas-well gas.

is thus narrowed to one of the weight to be given cost evidence and the particular cost-finding technique we are here to adopt.

The Supreme Court in the second *Phillips* case, in upholding the Commission's abandonment of individual company cost-of-service and sanctioning the Commission's efforts to proceed with the area rate approach, observed with approval that the Commission had stated that area rates would be based on the "'reasonable financial requirements of the industry' in each production area" and that "composite cost of service data will be considered in the area rate proceedings." (376 U.S. at 310)

Accordingly, we conclude that composite cost showing must be the basic ingredient in determining the area rate. This does not mean that other factors should not be considered. The Commission must exercise its judgment and determine a rate in light of all the evidence in the record. For one thing, the rate must be one that the evidence indicates will elicit a level of exploration activity adequate to provide the increased gas supplies required by consumers in the future. There is also a need to exercise judgment in the design of the rates to avoid unnecessarily sharp and abrupt departures from existing pricing patterns and the business and community dislocations which could result. Of course, in fixing the rate of return, a key element in the cost of determination, the Commission has wide discretion to consider these factors, so that to a considerable degree they can be accommodated within the framework of composite cost pricing. Nevertheless,

we make clear that we do not confine ourselves to a cost calculation in determining just and reasonable rates.

277,603

— 37 —

Basic to our determination of the guidelines for the price of new gas-well gas is the selection of the method of cost finding to be adopted. We shall discuss later in this opinion the cost basis for all other gas but it may be helpful here to say that we shall use the cost of gas-well gas as the yardstick for all prices we fix in this proceeding. We do so for two reasons. First, the record reveals that casinghead gas and other associated gas are found largely as a by-product of the search for oil. Historically, casinghead gas has not been priced on a cost basis and any cost-finding technique is unrealistic which assigns large sums for exploration and development to casinghead gas. A second and related reason is that gas-well gas costs are much more meaningful because they are far less dependent upon allocations between gas and oil than are the costs of casinghead and other associated gas.

The parties suggested three basically different methods for determining the cost of new gas-well gas. The main producer presentation is an estimate of the cost of financing new supplies of gas-well gas on an industry basis in which all exploration and development (E&D) expenses are capitalized and a discount rate of return utilized. The California Distributors also presented a gas-well gas cost study based on published national statistics and the answers by respondent producers to

the Commission's cost questionnaire but instead of capitalizing E&D cost, expensed them, and utilized a conventional rate of return. Both methods provide a nationwide cost for gas-well gas keyed to the cost of finding and producing new gas supplies. The third cost approach, presented by the Commission's staff, is a composite presentation patterned after the individual company cost-of-service approach in which there is determined the historical cost per Mcf of gas-well gas production. The staff also presented a similar composite presentation limited to Permian Basin area costs.

277,604

—38—

A preliminary question in determining the methodology of cost finding is whether costs are to be determined on an area or a national basis. As the examiner pointed out, the question is not whether a national price should be established but whether national or area costs should be used as the basic standard for fixing the future price of new gas-well gas in the Permian Basin. All parties agree that exploration and development operations are conducted by the industry on a national basis because it is impossible to isolate E&D by areas. Without adopting all of the reasons advanced by the examiner at pages 40 and 41 of his opinion we agree with the conclusion that the cost of new gas-well gas should be determined on a national basis. Perhaps most persuasive is the fact that we are fixing a price based upon current cost of finding an Mcf of gas and that much, if not most, of the rele-

vant information is available only on a national basis. It may be that in some areas production costs may vary sufficiently from the national average to warrant a different treatment but on the record in this case we agree that cost of new gas-well gas should be determined on the basis of nationwide data.

The examiner adopted, with modifications, the cost presentation of the California Distributors. We agree with the examiner that in determining a ceiling for new gas-well gas which is to serve as an incentive to search for additional gas the preferable approach is the one that is geared to the recent cost of finding and producing an Mcf of gas rather than the historical cost based on production volumes. Historical costs will not necessarily reflect current realities.

A price based on the current cost of finding and producing an Mcf of gas-well gas, on the other hand, should provide the economic incentives to find and sell gas under prevailing conditions at rates which are keyed to industry needs and at the same time protect the interest of consumers.

277,605

—39—

We believe that the method of costing we have adopted in this proceeding is required on the basis of the record before use and that it provides a sound basis for our decision. We emphasize, however, that our conclusions herein should not be construed as necessarily constituting the final solution of this intricate problem. Other methods

of estimating the new gas cost may be given further consideration in succeeding cases if adequately supported.

THE COST OF NEW GAS-WELL GAS

We shall now proceed with an examination of the presiding examiner's determination of the cost of new gas, and of the exceptions thereto, in our determination of the area price ceiling of new gas-well gas.

A word of explanation is in order as to the variety of data sources utilized for determining the cost of gas in this proceeding. The natural gas producers, unlike electric power companies and natural gas pipelines, have not as yet been required to conform their books to a uniform system of accounts. The petroleum producers typically do not reveal their cost experience or accounting treatment in depth. When this proceeding was initiated there were no statistics available based on a uniform set of accounts to provide the necessary information for making the cost determinations in this proceeding. The cost questionnaire promulgated by the Commission was designed to fill this information gap in part and the responses have supplied a vital source of information for determining costs in this proceeding. In addition Census data and other well-recognized and authoritative industry data sources were utilized by various witnesses in the proceeding. The record is thus built upon a variety of sources which we believe in combination provide an adequate basis for the costs we have found.

The presiding examiner found that the national average cost of an Mcf of new gas-well gas was 16.88 cents. His

computation and our modifications thereof may be summarized as follows:

277,606

—40—

	Cost in Cents per Mcf	
	Examiner	Commission
Exploration and Development Costs		
Dry Holes	1.42	1.42
Other Exploratory Costs	1.59	1.59
Adjustment for Exploration in Excess of Production	1.11	1.11
Production Operating Expense	2.88	2.70
Net Liquid Credit	(2.68)	(3.10)
Regulatory Expense	.14	.14
Depletion, Depreciation, and Amortization of Production Investment Costs		
Successful Well Costs	2.88	2.88
Lease Acquisition Costs	.76	.76
Cost of Other Production Facilities	.31	.31
Return on Production Investment (at 12 percent)	5.21	5.21
Return on Working Capital	.20	.35
Subtotal	13.82	13.37
Royalty at 12½ percent	2.11	2.05
Production Taxes[24]	.95	1.01
Total	16.88	16.43

[24] Texas production taxes of 7 percent have been used in the Commission's computation. New Mexico taxes are lower, and both cost computations and the ceiling price should be reduced accordingly for gas produced in New Mexico. The amount of production taxes does not include taxes on the royalty payments which are chargeable to the royalty owner.

EXPLORATION AND DEVELOPMENT COSTS

Dry Hole Costs

Adopting the California Distributors' presentation, the presiding examiner derived a dry hole cost of 1.42 cents per Mcf principally on the basis of data published by the United States Bureau of Census, Census of Mineral Industries for 1958 (1958 Census), with respect to drilling costs per foot. Since there were no such census costs available for 1960, he established a trend for such costs by comparing 1958 and 1960 cost data obtained, in response to the questionnaire circulated by this Commission, from producers of more than 10 million Mcf annually, producing in the Permian Basin.[25] He then adjusted the 1958 Census figures in accordance with the trend established from the questionnaire data to establish the 1960 costs.

The Major Producer Group objects to the examiner's use of questionnaire data to establish a trend in E&D cost from 1958 to 1960 and adjusting the 1958 Census figures on the basis of the trend established. We think the examiner was correct in determining that the questionnaire data are valid for purposes of establishing a trend in the entire industry. We adopt the reasoning of

---

[25] The questionnaire data includes costs from a few producers of less than 10,000,000 Mcf annually who also responded to the questionnaire. However, the inclusion of this data does not affect the results.

the initial decision upon this point, and the 1.42 cents per Mcf cost, as set forth in Appendix B, pages 1 and 2.

As we have already noted, other methods of computing dry hole costs were suggested in the record. Of particular interest in the alternative method of cost determination, advocated by the Major Producer Group, often called the project method, which capitalizes the total cash outlays to acquire a capital asset (*i.e.*, project) and allows a return on that investment over its productive life. Under this method, dry hole costs and other costs associated with unproductive ventures would be capitalized along with the cost of productive ventures. We find that this alternative method which would constitute a departure from our treatment of E&D in prior proceedings as well as a deparure from present industry accounting practices is not adequately supported in the record. The inadequacy is especially

notable with respect to the cost of capital for establishing the fair rate of return to be allowed on the computed investment base. However, capitalization of E&D may well be a useful approach and we do not foreclose in succeeding cases further consideration of this alternative method of costing or of improvements in the cost-finding techniques herein employed.

Other Exploratory Costs

In a category for exploratory costs other than dry holes, the examiner included geological and geophysical

expenses, lease rentals, and exploratory overhead. These costs were the subject of testimony by Witness Roseman for the California Distributors and Witness Park for Texaco, Inc. Roseman estimated the cost of geological and geophysical expenses and lease rentals on the basis of their relationship to lease acquisition costs as shown by the Chase Manhattan Bank's Annual Analysis of the Petroleum Industry for 1961. Since the purpose and result of the outlays for geological and geophysical activities and lease rentals is the purchase of leases, there is a direct relationship involved. The Chase survey shows that geological and geophysical expenses and lease rentals average 138 percent of lease acquisition costs in the period 1957 through 1960, the same period Roseman used in computing lease acquisition costs. Having determined that the lease acquisition costs for that period were 0.76 cent per Mcf (see pp. 51-52), Roseman accordingly computed the geological, geophysical, and lease rental costs at 1.05 cents per Mcf.

Exploratory and developmental overhead were calculated by Roseman on the basis of their relationship to total finding and developmental costs. The 1958 Joint Association Survey, the only published source of such data, established overhead costs as being 8.4 percent of total finding and development costs, or 0.54 cent per Mcf. (Total finding and developmental costs were 6.42 cents per Mcf, this being the total of 1.05 cents for geological and geophysical expenses and lease rentals, 1.42 cents for dry holes, 2.88 cents for successful well costs, 0.76 cent for lease acquisition costs, and 0.31 cent for cost of

other production facilities.) Adding 0.54 to the 1.05 cents per Mcf costs for geological, geophysical, and lease rental costs, results in a total of 1.59 cents for the category of Other Exploratory Costs.

Witness Park used a different method. He combined geological and geophysical expenses, lease rentals, and overhead into a single item. He then found that the ratio of this item to dry hole exploratory expense, based on the Joint Association Survey, was 1 to 1. His result is 1.56 cents.

We believe that Witness Roseman's approach which computes each of these items of cost on the basis of comparisons with items to which they are functionally related is preferable. In any event the difference between the two witnesses is *de minimis* and no exceptions were taken to the examiner's determination of 1.59 cents per Mcf based upon Roseman's testimony. We therefore adopt the examiner's finding as supported in the accord.

ADJUSTMENT FOR EXPLORATION IN EXCESS OF CURRENT PRODUCTION

The record establishes that additions to proved reserves of natural gas in the United States have exceeded production in each year. We believe it essential to encourage a level of exploratory effort which will continue to provide for findings in excess of production. Since

exploration and development losses are expensed by the industry in the year incurred, and are so treated here (but see our discussion of the possible use in the future of the project method, pp. 41-42), the allowance for such losses should be recouped from production during that year. The total cost of finding the necessary volumes of gas must be translated into an allowance per Mcf of gas produced so as to bring in the necessary revenues. To this end a conversion factor is necessary to adjust the per Mcf cost of unsuccessful E&D efforts from the volume of reserves discovered to the volume of gas produced during the year.

The ratio of findings to production vary from year to year. These ratios for gas-well gas were 122 percent in 160, 155 percent in 1961, 180 percent in 1962 and 122 percent in 1963, while the weighted average of findings of all gas was 127 percent of production for the years 1960 through 1964. The appropriate ratio for these purposes is a matter for careful judgment rather than scientific formula.

277,610

— 44 —

We recognize that what the industry has been spending is not necessarily the desirable expenditure in the public interest. We believe, however, that the level of recent expenditures represents an appropriate basis for determining the ratio which should be adopted. In applying judgment we conclude that the ratios for gas-well gas are the more significant, but they must be discounted in view

of atypical result 1962. If the 1962 figure is brought down to the level for 1961, the four-year average becomes 138 percent. These figures point to an adjustment figure in the range of 35 to 40 percent. In these circumstances we shall utilize the 37 percent figure adopted by the examiner with which all parties have concurred. We believe such a ratio provides a necessary adjustment of the allowance for E&D for new gas-well gas to permit a level of findings reasonably in excess of production. Applying this ratio to the 3.01 cents per Mcf for E&D results in an additional 1.11 cents per Mcf allowance.

The examiner reached a similar result although he associated his allowance, which he termed an "allowance for growth", with a precise reserve-production ratio for the future, a rationale which we cannot accept. However as we have explained, we are satisfied that his conversion factor approximately represents the recent history of findings and is an appropriate conversion factor to permit the recovery of the cost of exploration and development during the year incurred.

The Major Producer Group's exception on this point, which is based on a contention that the ratio of reserves to production should be increased to 20 to 1, is denied. See *supra*, pp. 25-28.

Summary of Exploration and Development Costs

The exploration and development allowance which we here provide as a component of the cost of new gas-well gas will permit the industry to recoup from current pro-

duction all costs presently being incurred in a satisfactory level of exploratory effort. In effect we have found that the industry is now spending approximately 4.12¢/Mcf for exploration and development computed on the basis of the total production of new gas-well gas. Our allowance for E&D provides the industry with the funds to continue the same ratio of E&D in relation to volumes produced.

277,611

— 45 —

PRODUCTION OPERATING EXPENSE

On the basis of testimony by Witness Roseman on behalf of the California Distributors, the examiner found that a cost of 2.88 cents per Mcf was proper for production operating expense. Witness Park, presented on behalf of Texaco Inc., testified that the amount should be 2.62 cents per Mcf, or 0.26 cent lower. Both Park and Roseman derived their figures from the data on nationwide production costs received by this Commission in response to the questionnaire circulated to Permian Basin producers.

The basic differences between Roseman's and Park's results are two-fold. The first is that in the allocation of overhead expenses Roseman used direct lease cost and expenses, including depletion, depreciation and amortization (DD&A). Park, on the other hand, used direct lease costs and expenses, but excluded DD&A. We find that Park's exclusion of DD&A was proper for the reasons

set forth in discussing this issue in connection with flowing gas in Appendix C, page 3.

The second difference is that Roseman made an adjustment of the production operating cost to reflect national production of condensate and gas, rather than relying strictly on the questionnaire data for production of condensate and gas. His justification for such adjustment, which the examiner adopted, was that the respondents filing questionnaire data produced a disproportionately large amount of lease condensate in relation to their gas production. (They produce one-half of the national lease condensate but only one-third of the national gas-well gas.) Park did not make such an adjustment. We agree with Roseman that this adjustment should be made because of the disproportionate production of condensate. We adopt Roseman's production operation expense allowance but modify it to reflect the proper overhead allocation. Making this modification, the production operating cost is 2.70 cents per Mcf.

277,612

— 46 —

ADJUSTMENT OF NET PRODUCTION TO MARKETED PRODUCTION

The examiner included no special item in his cost computation to reflect the costs of gas produced but not sold. Witness Park included a 5-percent adjustment which he said was to compensate for waste, for venting, and for gas consumed on the producing property. The

Major Producer Group contends that there should be at least a 2-percent adjustment. The annual reports of the Texas Railroad Commission and the Louisiana State Conservation Commission for 1960 show that in these states, which produce 75 percent of the nation's gas-well gas, less than one-tenth of one percent of the gas was vented and wasted.

We agree with the examiner for the reasons stated at pages 85-86 of his opinion that there is no justification for making any allowance for the negligible amount of gas vented or wasted.

NET LIQUID CREDIT

When gas is produced some of the entrained liquids may condense while the gas is being lifted or shortly thereafter, and some of the liquids may be extracted by processing operations. The producers often receive substantial revenues from the sale of the liquids independently of the price they receive upon sale of the gas, and such liquids are an important item of commerce. Witness Roseman, on behalf of California Distributors, and Witness Park, on behalf of Texaco Inc., both credited the revenues received by gas producers from the liquids contained in the gas to the cost of finding and producing the gas. The Major Producer Group now contends that no liquid credit should be adopted. Staff, on the other hand, has excepted to the examiner's determination that the proper amount of the liquid credit is 2.68 cents per Mcf, net, after royalties and production taxes are deducted, and contends that the proper amount for new gas-well gas is 3.27 cents per Mcf.

As to the basic issue whether it is appropriate to credit the cost of gas with the liquid revenues, we adopt the examiner's views as follows:

> The logic of crediting the revenues from the liquids is that the producer can reasonably expect that, from a proposed expenditure in the generally directional search for and production of gas-well gas, he will receive revenue from the liquids as well as from the gas. Thus he may count against his prospective total cost the expected revenues from the liquids. The remainder represents the revenues to be derived from the gas if the total costs are to be met, and is the cost burden that has to be borne by the gas. Since the price of lease condensate has been relatively stable in recent years[11] and since the credit amounts to only sixteen percent of the price for new gas-well gas adopted herein, it is not likely that changes in the price of condensate will produce significant swings in the price of gas. In these circumstances, crediting the liquids is reasonable for the purpose used here. (Initial Decision, Appendix, B, pp. 88-89.)

The producers' argument to the contrary is essentially that since the Commission does not regulate the sale of

---

[11] Average prices for lease condensate were: 1954, $3.01 per barrel Census; 1958 $3.05, Census; 1960 $3.03, Appendix B.

liquids it is improper to credit revenues. This is equivalent to saying that oil-well gas should be priced at the total cost for both oil and gas because we do not regulate oil prices. The argument has been rejected by the courts with respect to crediting of liquid revenues extracted by pipelines.[26]

Witness Roseman's testimony and the presiding examiner's determination as to the amount of the liquid credit were based upon published statistics of the American Petroleum Institute (API) and the *Oil and Gas Journal.* The gross credit is derived by multiplying the condensate production from gas-well gas by the price received for the liquids and dividing this amount by the total gas-well gas production for the year in question. Using the *Oil and Gas Journal* production figures, the examiner concluded that 3 cents per Mcf is a reasonable estimate for the gross lease liquids credit from which he deducted royalty of 12.5 percent and production tax to obtain a net credit of 2.48 cents, exclusive of plant liquids revenue which we shall treat separately.

All of the statistical series point to the conclusion that there has been an increase in condensate production from gas-well gas since 1960, a rate of increase which is greater than the rate of increase in finding and producing gas

---

[26] *Panhandle Eastern Pipe Line Co.* v. *FPC,* 324 U.S. 635, 646 (1945; *Cities Service Gas Co.* v. *FPC,* 155 F.2d 694, 703 (CA 10, 1946); *Panhandle Eastern Pipe Line Co.* v. *FPC,* 305 F.2d 763, 767-768 (CADC, 196....), *cert. denied,* 372 U.S. 916.

(277,614)

The fact that the increase in condensate products has outstripped the increase in gas-well gas production reflects the richer content of liquids in the new gas-well gas which is being discovered and the improved separation techniques developed by the industry. The examiner by basing his credit exclusively on the liquid to gas ratio in current production has not taken into account this trend in condensate production. Since we are here concerned with a ceiling price to apply to new gas-well gas, the liquid credit we allow must reflect current and expected experience. We believe that a figure based upon the respondents' responses to the Commission's questionnaire is more nearly representative of current trends. Witness Park determined a gross credit of 3.71 but as was explained with regard to production operating expenses (*supra,* page 54) we agree with the examiner and Witness Roseman that the questionnaire data from which this figure was derived by Witness Park was not fully representative of industrywide production. The questionnaire data reflects a larger production of condensate on a unit basis than do the nationwide statistics. Accordingly, in our judgment, the 3.71 cents per Mcf gross liquid credit should be adjusted downward to reflect this distortion. We believe that taking all facts into consideration the proper gross liquid credit should be 3.50 cents per Mcf. This credit is based upon production which is well within the range of published statistics for 1960 and is in line with the trend in later years toward increased realization of condensate per Mcf of gas.

The gross figure of 3.50 cents after deduction of production taxes and royalties leaves a net liquid credit of 2.90 cents, not including plant liquids, which we here adopt.

In addition to liquids extracted at the well, gas-well gas is also processed at stripping plants. Producers usually share in the revenues from these plant liquids on a percentage basis. Witness Roseman testified that if the producers receive only 20 percent of the liquid revenues it would amount to 0.4 cent per Mcf of gas-well gas produced. The California Distributors and Texaco, who sponsored witness Park, stipulated that for purposes of this case a credit for plant liquids in the range of 0.1 cent to 0.2 cent per Mcf of gas-well gas produced could be used. In light of Witness Roseman's analysis and the trend of richer liquid content which the record reveals we shall adopt the examiner's conclusion that the upper range of the stipulation, 0.2 cent per Mcf, should be accepted as an appropriate plant liquid credit.

The addition of 0.20 cent per Mcf to the 2.90 cents per Mcf net liquid credit gives a total liquid credit of 3.10 cents per Mcf.

REGULATORY EXPENSE

Neither Witness Roseman, for the California Distributors, nor Witness Park, for the Major Producers Group, included in the computation of costs any amount of regu-

latory expense. The presiding examiner, however, included in his computation an item of .14 cent per Mcf for regulatory expense, based on data derived from answer to the questionnaire. Since it appears to be a reasonable estimate and no participant disputes its inclusion, it will be accepted.

277,616

— 50 —

DEPLETION, DEPRECIATION, AND AMORTIZATION OF PRODUCTION AND INVESTMENT COSTS

Production investment costs include successful well costs, lease acquisition costs and cost of other production facilities. These items were capitalized by the presiding examiner, and we agree. The total of these items will establish the rate base on which a return must be allowed. The amount of the rate base itself must be recovered by the producers by charges for depletion, depreciation and amortization over the period of the economic life of the investment. The procedure we use is to convert DD&A to an Mcf basis and to add an element for return on the production investment per Mcf. We shall discuss separately each item involved in the calculation.

Successful Well Costs

The examiner found that successful well costs amounted to 2.88 cents per Mcf of gas found. He determined this amount by dividing the cost per foot of

successful wells drilled in 1960 by the average of gas reserves added per foot of drilling in a year. The drilling cost per foot was derived from data in the U. S. Bureau of Census, Census of Mineral Industries for 1958, adjusted to 1960 on the basis of the questionnaire data. The total reserves added were derived from the AGA proven reserve statistics.[27]

The Major Producer Group first argues that the Joint Association Survey (JAS)[28] cost per foot of well drilling should be used in place of the 1958 Census data as trended to 1960. In the alternative, they urge that if the 1958 Census cost is used, this cost should not be adjusted downward on the basis of the questionnaire data to arrive at the 1960 cost. They conclude that the successful well drilling cost should be computed at 3.10 cents per Mcf of gas reserves added, rather than 2.88 cents as computed by the presiding examiner.

We agree with the presiding examiner that the JAS statistics should not be used to decide this issue. The presiding examiner has pointed out that the companies included in the JAS were not selected on a random basis, and that filling out and returning the JAS questionnaire was voluntary. The results thus reflect a considerable

---

[27] Identified in this proceeding as Bureau of Mines *Minerals Yearbook*, Vol. II (which is a reprint of the AGA data). The footage used with this data was obtained from *World Oil* magazine.

[28] The JAS is a survey by three industry trade groups and is based on a questionnaire mailed by these groups to all their member companies.

amount of self-selection. Due to the method of selection there is no assurance that the sample is characteristic of the industry as a whole and it should not be used in preference to the 1958 Census, even though cost based upon the 1958 Census was adjusted by trending to determine the comparable 1960 cost.

In our discussion of dry-hole costs we have already dealt with the question whether cost derived from the 1958 Census may properly be trended on the basis of questionnaire data to determine comparable 1960 costs, and affirmed the examiner on this point. We believe it is not only appropriate but necessary to make the same adjustment in this connection. The exceptions in this regard will therefore be denied.

Lease Acquisition Costs

Witness Roseman, on behalf of California Distributors, computed lease acquisition costs at 0.76 cent per Mcf for gas found. In common with all other witnesses on this subject, he determined the cost per Mcf of lease acquisitions on the basis that such cost is directly related to successful well drilling cost. He found that the appropriate figure was 26.4 percent on the basis of data collected in a survey by the Chase Manhattan Bank and data contained in the 1958 Census.

The presiding examiner accepted Roseman's computation of 0.76 cent per Mcf. The Major Producer Group

excepts to this finding, and contends that Witness Park's computation of 1.15 cents per Mcf should be used. Park computed his figure on the basis that lease acquisition cost is 40 percent of successful well cost per Mcf.

We agree with and adopt the presiding examiner's analysis of this question set forth in Appendix B to the initial decision, pages 80-83. The adopted portion, together with an additional analysis reinforcing our conclusion here, is set forth in Appendix B to this opinion.

Cost of Other Production Facilities

The examiner approved 0.31 cent per Mcf for this item which includes lease equipment, related lease facilities and apportioned overhead investment. The 0.31 cent figure is supported by the testimony of Witnesses Roseman and Park, but for different reasons. Witness Park's recommendation was an integral part of a broader presentation which we have not accepted and for that reason we rely on the testimony of Witness Roseman. In substance, Witness Roseman's testimony is that the respondent's gross investment in these items approximates 8½ percent of the gross investment in leases and wells attributable to non-associated gas, and that a comparable percentage of the previously determined lease and well costs should be allowed for these items. We find the amount to be reasonable and we shall affirm the examiner's finding on this point.

Allowance for Growth in Investment

The Major Producer Group contends that in his computation of production investment costs the presiding

examiner should have included an allowance to reflect future increases in investment. We believe

the examiner correctly excluded such an adjustment. Production investment costs are capitalized and recouped, with a return realized from the sale of gas over the period of the life of the investment. This investment is stated in terms of an amount per Mcf of gas found. While the total investment may grow, there is nothing in this record to support a conclusion that there will be an increase in the amount invested per Mcf of gas found. Accordingly, we believe there is no basis for any additional amount as an allowance for growth in production investment costs.

Period of Recovery of Investment

A return must be allowed upon the investment for the average period of recoupment. Having determined the total production investment cost to be 3.95 cents per Mcf, the presiding examiner then estimated that the average period required for return of each dollar of that investment will be 10 years after the resulting gas begins to flow. He reached this conclusion by assuming that the gas will be totally depleted in 20 years, the normal life of a contract, and that the depletion will take place in an equal amount each year. The Major Producer Group and The Superior Oil Company contend that the true

period of depletion is at least 22 years, and that this period rather than 20 years should be the basis of calculation.

These respondents are correct in pointing out that the period of well depletion is somewhat longer than 20 years. More than offsetting, however, is the fact that wells are not depleted uniformly over their producing life. They produce a greater output of gas and condensate during the first years of depletion. Production usually begins to decline some 7 to 12 years after the well begins to flow until, during the last years of depletion, the well is producing only a fraction of its flow in earlier years. While exact figures are not available, it appears that the additional years of minimal production, not included in the examiner's computation, are more than offset by his computing depletion at an even rate rather than taking into account the higher production in early years and the greatly lowered production at the end of the period. Accordingly, the exceptions on this point will be denied.

Lag

Some of the production investment costs must be made in advance of the time that gas begins to flow. Lease acquisitions are often made a substantial time in advance. Expenses for successful wells must be incurred before any gas can be produced. To allow for this lag between investment and first realization of revenue from sale of the re-

sulting gas, the presiding examiner allowed 1 year of so-called "lag time" in addition to the 10-year period in which the average dollar of investment will be recouped after production begins.

The California Distributors urge that no lag period be included. They contend that the investment of funds before gas begins to flow is more than offset by the fact that some of the investment is not made until after gas has been in production for some time. They refer to this as "negative lag."

The Major Producer Group, on the other hand, contends that the lag should be from 3 to 5 years, and that the 1-year period allowed by the examiner is insufficient.

While it is generally conceded that a time gap does exist between the outlays for some productive investment and the initial receipt of income, the evidence in the record is general and vague insofar as it concerns a specific time period. Moreover, this general testimony is offset to a certain extent by the evidence of investment which does not take place until gas has been in production and evidence that some items will be used for only part of the time in which a return will be allowed. There is no precise computation of the average amount of expenditures involved in either the lag or the "negative lag," or of the amounts of time by which these expenditures precede or follow the date when gas begins to flow.

Geological and geophysical expenses and exploratory overhead, both of which may be expended several years before a well begins to produce, are not ordinarily ac-

counted for as part of production investment costs. They are part of exploratory and development costs which are

treated as expenses by the producers in the year in which they are incurred. Successful well drilling costs are approximately 73 percent of the production investment costs. These would ordinarily be incurred within the one year lag before gas begins to flow which the examiner has allowed. Lease acquisition costs may occur earlier, but these are little more than 19 percent of the total production investment costs. The cost of other production facilities, which is approximately 8 percent of the total production investment cost, as here determined, would be incurred largely within the one-year lag period.

Taking into consideration the evidence of both the positive and negative lag, we believe that the presiding examiner's determination on this point should be upheld.

RETURN ALLOWANCE

Rate of Return

Respondents urge the adoption of a rate of return in the range of 16-18 percent on average net investment. In support, they refer to returns previously allowed in producer and pipeline litigation and to the traditional and current earnings experience of numerous industrial and utility categories. Respondents' principal argument is that the risks inherent in exploration are voluntarily in-

curred and extraordinary and they must be recompensed in the rate-making process. They also argue that the discounted cash-flow analysis is the keystone to the producer return issue. The producers also stress the time lag between investment of funds and receipt of income.

Staff, joined by the California interests, presses for a 9½ percent return on average net investment which translates into 10½ percent on common equity. Staff offered extensive testimony which focuses heavily on the earnings experience of integrated producers, who supply the bulk of the natural gas production. Staff supports its reliance on the experience of the integrated producers partly by claiming there is no proof that their non-production departments are less risky than their production departments. Staff recognized the geological

risks inherent in exploration but considers them to a degree offset because of the producers' alleged ability to avoid income taxes, their low-debt capital structure, and the opportunity, implicit in group regulation, for low-cost producers to achieve higher than average returns. For these reasons, Staff concludes that a return must be set in this proceeding which is somewhat lower than that which would be deemed appropriate in the context of individual regulation.

In determining an appropriate rate of return, the Commission must operate within long-accepted judicial

guidelines. Many of them, although established in the context of individual company regulation, apply with equal validity to the *en masse* regulation we have adopted herein. Simply stated, the courts have consistently held that the return must be sufficient to attract new capital, be in line with that earned by comparable industries, *e.g., F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591 (1944); *Bluefield Water Works and Improvement Co.* v. *F.P.C.*, 262 U.S. 679 (1923), and most significantly, be determined, not through the automatic application of formulae, but through informed judgment taking into account all relevant facts, *e.g., State Corp. Commission of Kansas* v. *F.P.C.*, 206 F.2d 690 (CA8 1953), cert. denied, 346 U.S. 922 (1954); *Washington Gas Light Co.* v. *Baker*, 188 F.2d 11 (CADC 1950), cert. denied, 340 U.S. 952 (1951).

As a starting point in our analysis, we turn to the financial requirements and experience of a sector of the gas industry with which years of regulation have made us familiar, the natural gas pipelines. The transmission sector is an immediate adjunct of production, and the two have evolved contemporaneously. An examination of recent transmission company rate proceedings indicates that representative companies

are currently being allowed returns on net investment in the 6.0-6.5 percent range, with the preponderance between 6.25-6.5 percent. While we have recently been em-

phasizing the overall return, it is instructive that a 6.25-6.5 percent return on transmission net investment translates, considering current capitalization patterns, into a yield on equity of from 10.0 to 12.0 percent. Although this yield is by no means dispositive of the issue before us, it places the issue of an appropriate rate of return for gas production in a more meaningful context, especially in view of the fact that producers generally are 85 percent equity companies. In addition, production operations inherently involve a greater degree of risk than the transportation of gas.

The difference in the degree of risk is highlighted by the fact that the construction and operation of transmission lines are authorized only upon the issuance of certificates of public convenience and necessity, and these, in turn, require a showing of economic feasibility. *Northern Natural Gas Co.*, 28 FPC 1155 (1962). By contrast a producer who is exploring for new gas is relying largely on the law of averages, especially under the area rate approach.

Transmission companies generally have assured sources of supply, traditionally under at least twenty-year contracts. They are generally able to shift to their purchasers the burden of their costs, and they have a minimal labor problem. Considering these factors, together with the projected continuation of a 3.5 percent growth in consumer demand, the 6.25-6.5 percent overall return and the 10 to 12 percent yield on equity for pipelines can be considered as applying to a relatively safe investment, at least by comparison with gas production.

In comparing the allowable returns on production with the returns previously allowed in transmission proceedings legal precedent and financial requirements dictate that if unusual risks are inherent in production, a greater return should be allowed on investments therein in the absence of record evidence to support a different conclusion. See, *e.g.*, *F.P.C.* v. *Hope Natural Gas Co., supra; F.P.C.* v. *Natural Gas Pipeline Co.*, 315 U.S. 575 (1942); *Bluefield Water Works and Improvement Co.* v. *F.P.C., supra; Wilcox* v. *Consolidated Gas Co.*, 212 U.S. 19 (1909). It is beyond question that the business of exploring for natural gas and, to a lesser extent, its production, is fraught with uncertainties foreign to its transmission. Justice Jackson pointedly expressed this fact in his oft-quoted dissenting statement in the *Hope* case, and the Commission has repeatedly recognized it. Thus, we said in *Phillips*:

> It is clear that the risks of this business [exploration and development] are greater than those of an electric utility or natural gas pipeline. 24 FPC at 572.

We have also noted the special risks involved in production operations:

> The producer must invest his funds prior to ascertaining whether he will have anything to sell or whether, if he does, he will have an adequate market. *Id.* at 543.

(277,624)

And later in *CATCO:*

> We are fully cognizant of the risks of drilling for gas and the need to encourage continued exploration and production. 27 FPC at 106.

277,625

— 59 —

And still later in *Southern Natural Gas Co.*, 29 FPC 323, 336 (1963):

> It is well recognized that a series of dry holes or even a single dry hole may bankrupt an independent producer, and it is equally well recognized that an independent producer who has the misfortune to discover high-cost gas may very easily find it impossible to dispose of such gas at a price which returns more than a small fraction of his costs of discovery and development.

The principal uncertainty lies in finding gas in commercial quantities, and is emphasized by the record evidence that producers, while seemingly able to a degree to direct their searches for particular hydrocarbons, have no assurance that any hydrocarbon will be found. The risk of a dry hole — or noncommercial well — is one that has characterized the production activity since its inception. That the risk is not merely theoretical is borne out by the questionnaire data compiled in Staff exhibit 142 which reveals that Permian respondents in 1960 spent approximately $212,342,000 on geological and

geophysical expenses, $114,284,000 on lease rentals and $271,576,000 on dry holes. While it is true that in the aggregate we allow these costs as an operating expense, the uncertainty whether productivity will meet the industry average nevertheless remains as a risk for each individual producer and it must be recognized in the rate-making process.

There is another risk in the production operations which our allowance for a rate of return in this proceeding must reflect — the risk of finding gas of less than pipeline quality. The record reveals that the greater percentage of the gas in the Permian Basin does not fully meet the pipeline quality standards prescribed herein. The details respecting quality adjustments are discussed *infra* at pages 94-103. While we have provided upward adjustments for new gas-well gas with above average Btu content, nevertheless there remains the risk that any gas found can be sold only at an adjusted ceiling price which involves a substantial discount from the ceiling prices for gas of pipeline quality prescribed herein. Such risk is a special factor that must be considered in establishing the rate of return for the Permian Basin.

Agreeing that production operations involve risks which must be recognized in our allowance for rate of return, yet we conclude that the risks are not as great as the producers claim. The producers' case for a 16-18

percent rate of return ignores the fact that there is a degree of predictability to production operations as evidenced by the fact that the industry as a whole has maintained over extended periods a consistent record of new discoveries and added reserves. The producers statistical support for a 16 to 18 percent return rests on data that contain conspicuous infirmities. As pointed out by the examiner, Witness Morton's statistical presentation contains only one instance of an 18 percent rate of return on capitalization. We affirm the examiner's conclusion that Morton's sample is unrepresentative.

The return producers seek is greatly in excess of the recent earnings experience of even the nonintegrated producers. It is three-fold the return allowed on transmission investments and it would produce a yield on common equity of approximately 20 percent. Such a return is neither typical nor necessary, and must be rejected.

We have already discussed the "true yield" method for determining capital cost which expresses the discount rate equating the value of a stream of future revenue with the cost of the initial investment generating that stream. It is employed herein by the producers to demonstrate the earnings rate disparity between it and the conventional method which allows a return on net investment. The witness advancing this unconventional approach has merely urged that the disparity between book yield and "true yield" be recognized in a larger return allowance and provided little in the way of support for the application of his alternative method. In these circum-

stances, his approach cannot be used in resolving the rate of return issue in this case.

We now turn to the earning experience of the production industry to fix the return to be allowed in this proceeding. Staff witness Shaffner's Exhibit 176 analyzed in Schedules 11 and 12 the 1957-1961 rates earned by two classes of producers: those that were principally engaged in production, and those that were also engaged in refining and marketing. The schedules, based on *Moody's Industrials and Annual Reports to Stockholders,* were limited to companies with interstate sales to pipelines in

excess of 2,000,000 Mcf annually, with actively traded common equity, and with a policy of making periodic reports of their earnings posture.

The Staff Exhibit 176, Schedule 11, reveals that the average returns for nine companies confined to production functions in each of the years 1957-1961 were, respectively, 13.9, 10.9 (including an .8 percent return for one company), 12.4, 11.6, and 13.2 percent, which produced an average of 12.4 percent, and a five-year median of 10.9 percent. When only the experience of the seven Permian producers is reflected the returns for the same years are as follows: 15.0, 12.4, 13.9, 12.5, and 13.4 percent, making an average of 13.4 and a median of 11.3 (Exhibit 176, Schedule 12). These

staff figures are consistent with respondent witness Morton's Exhibit 220, showing that 13 producers engaged solely in production, including six not covered by 13.0 and 14.4 percent over the same period. This produced an average return of 14.5 and a slightly lower median of 14.4 percent.

Both the Staff exhibits and the presentation of Witness Morton were limited in the number of individual companies covered; the latter also employed subjective considerations in selection and was forced to report on a less comparable basis. Nevertheless they are the best record indication of what the production function traditionally returns. We conclude that they are entitled to heavy consideration in the decisional process in this case.

Witness Shaffner's second category was comprised of 26 integrated producers. The average return experience for these companies was 10.0, 7.9, 8.1, 8.2, and 8.2 percent for the indicated years, which gave a five-year average of 8.5 percent and a median of 8.1. When limited to the 24 integrated Permian producers, the figures decreased slightly: 9.9, 7.8, 8.0, 8.0, and 7.8 percent, for a five-year average and median of 8.3 and 8.1 percent, respectively.

On a general average basis, the resulting return was 9.5 percent for both the national and Permian producers. On

an average weighted by capitalization basis, both national and Permian-only, the resulting return was 9.3 percent, reflecting that the total capitalization for the 26 integrated companies was over 40 times that of the nine non-integrated companies.

The Shaffner study of the returns of integrated producers standing alone fails to make a persuasive showing that the results are the best evidence of the financial needs of the gas operations of the companies involved. It covers the most widely diversified segment of the industry, those whose revenues were derived from the sale of petrochemicals, fertilizers, plastics and gasoline, as well as from transmission, distribution, real estate and manufacturing enterprises. The exhibits in the record, and the sources upon which they are based, offer no ratio of the integrated company oil and gas production revenues to total revenues, although they do reveal that revenues generated by natural gas sales to pipelines accounted for but 2.22 percent of total revenues. Without a departmental segregation of costs and revenues, it is impossible to calculate production department returns. It may be that on a different record the returns of integrated producers may be shown to be highly relevant but without any assurance that production returns approximate overall returns, we cannot automatically attribute the latter to the former. Accordingly, while we are persuaded that integrated producer returns are relevant to the instant issue, we are not persuaded that the Shaffner exhibit sufficiently weights production operations in his recommended return of 9.5 percent.

(277,628)

After weighing all the evidence on the issue we believe a return of 12 percent is appropriate in light of the considerations previously discussed and the presentations in this case, particularly the testimony of witnesses Shaffner and Morton with respect to the returns by nonintegrated producers in the Permian Basin. A return of 12 percent on production activities protects gas consumers against excessive prices but it is not so low that it fails to respond to the needs of the industry. It also considers the needs of the smaller independent who traditionally drills much of the Permian exploratory footage and his limited resources to weather even a brief series of unproductive expenditures. It may

277,629

— 63 —

be that another result may be reached on a different record but in this first area rate proceeding we believe the record points to a return of 12 percent and it is therefore adopted.

The presiding examiner, having determined that the total production investment would be recouped over an average period of 10 years beginning an average of 1 year after investment, correctly concluded that the total return to be allowed on each Mcf of gas should be based on an investment base that is 11 times the production investment per Mcf found. As the production investment was found to be 3.95 cents per Mcf, the investment base here is 43.45 cents. The annual return per Mcf should be

computed by multiplying 43.45 cents by the 12 percent rate of return, producing a figure of 5.21 cents per Mcf.

Return on Working Capital

To the return on net investment must be added the return on a working capital allowance. While in this proceeding the return on the allowance is a small item, it raises a policy question for decision.

Distributor witness Roseman presented a working capital computation in Exhibit 224 which follows the traditional utility formula of allowing in the rate base for a 45-day lag in collections; that is, a return is allowed on the sum of one-eighth of annual production operating expenses, one-eighth of annual exploration expenses, and amounts invested in supplies, materials and prepayments allocated to the exploration and production functions. The resulting allowance is 1.63 cents per Mcf which, at a 9½ percent rate of return, gives a .16 cent return. The presiding examiner accepted the method but, substituting 12 percent, allowed a .20 cent return.

The producers contend that the utility formula is inappropriate for the producing industry because it excludes funds that must be kept available for lease plays, drilling failures and exploration. They point out that their ratio of net plant to total capitalization is far smaller than in the transmission industry, and consequently, recurring cash needs, which are not covered by the return on net

investment, become more significant. The producers advocate a "balance sheet formula" which would allow a full return on the current net assets. They conclude that a representative allowance would be either 23 percent of total capitalization, which is the ratio of actual working capital to total capitalization for the thirteen non-integrated producers covered in their Exhibit 220, or 17 percent, which purportedly represents the ratio found in the Chase Manhattan Bank 1960 study of the actual cash portion of current net assets to net plant for the integrated companies. The Staff reply brief, however, correctly points out that the actual cash portion is but 6.7 percent, the other 10.3 percent representing marketable securities.

Staff and the distributors attack the balance sheet formula. They contend that it inappropriately allows a return on such items as total cash on hand, marketable and capitalized securities, accounts and notes receivable, and — in the case of the integrated producer — current assets applicable to refining and marketing. They argue that because net current assets have no reasonable relationship to the function of the working capital allowance, the balance sheet formula has been uniformly rejected by this Commission and the Courts. Staff concludes that the Commission has regularly employed the utility formula for producers and that other sources assure the availability of sufficient funds. Consequently, no further allowance is appropriate.

The Commission was first presented with a balance sheet approach in *Cities Service Gas Company*, 3 FPC 459 (1943), where it rejected the method as being "* * * unsound and inherently fallacious for ratemaking purposes." 3 FPC at 478. The case was affirmed, 155 F. 2d 694 (CA10), cert. denied, 329 U.S. 773 (1946). The Commission reaffirmed this conclusion in *Northern Natural Gas Co.*, 11 FPC 123 (1952) and the reaffirmance was specifically upheld in *Corp. Comm'n of Kansas* v. *F.P.C.*, 206 F.2d 690 (CA8 1953), cert. denied, 346 U.S. 922 (1954). The method was also rejected in *Panhandle Eastern*

Pipeline Co., 13 FPC 53 (1954), *rev'd on other grounds, City of Detroit* v. *F.P.C.*, 230 F.2d 810 (D. C. Cir. 1955). The balance sheet approach now urged upon the Commission incorporates the same flaws as found in the previous versions of this method. As herein presented, it is insufficiently refined and meaningful to be a legitimate regulatory formula, and we see no reason to depart from the sound reasoning of the *Cities Service* decision.

We are convinced that the balance sheet approach must be rejected and conclude that the four additive factors in the utility formula — cyclical expenses, materials, supplies and prepayments — are justified components of a working capital allowance for the producing industry, and that the formula is appropriate for calculating these

factors. We appreciate, however, that the erratic nature of individual company lease acquisitions, the competition among producers for attractive leaseholds, and the established practice of the industry to generate its own capital, demand that additional liquid sums be kept available. Accordingly, a compensatory "lease play" return must be allowed on reasonable amounts in excess of the working capital allowance based on the traditional utility formula.

Such funds in reasonable amounts are not idle or dormant in a meaningful sense. They are being employed as the exigencies of the business demand: in ready reserve for expenditures upon which the contribution of the industry depends. Such funds are not surplus, because they could not be dissipated without adverse effect on the exploratory effort. Moreover, there is no likelihood that they will be retained merely to inflate rate bases. Producers are relatively assured of receiving a return on funds invested in securities, and they have a fair opportunity of receiving a return on funds invested in the producing industry. Perhaps the most persuasive reason why excess sums are unlikely to be retained is that producers reduce their tax liabilities by a continued investment in the industry; the depletion allowance, by law, can offset no more than 50 percent of net income from a productive lease. This immediate tax benefit accruing from reinvestment far outweighs any incentive to mere accumulation.

We find that the producers must be given a return on the funds retained for lease play in addition to the 0.20 cent per Mcf return allowance computed under the traditional utility formula. An exact amount for this additional allowance is difficult to determine from the present record. Presuming that the producers should be allowed a return on liquid funds on hand equivalent to one and one-half times their per Mcf expenditures for lease acquisitions, return on the allowance for lease play would be approximately 0.15 cent per Mcf.[29] Future proceedings may elicit a more precise method for computing this amount.

For the purposes of this case, 0.15 cent per Mcf will be added to working capital as a lease play return allowance, making the total return on working capital 0.35 cent per Mcf.

ROYALTIES

Both Witness Roseman and Witness Park included royalties at the rate of 12.5 percent in their computations of cost. The presiding examiner accepted this figure and no participant demurs to the inclusion of such an item or to the 12.5 percentage. The examiner's figure of 2.11 cents per Mcf will be adjusted to 2.05 cents per

---

[29] As determined herein, the annual lease acquisition cost per Mcf is 0.76 cent. A lease play allowance based on a 12 percent rate of return on one and one-half times this 0.76 cent per Mcf amount would be .137 cents per Mcf.

Mcf to reflect the changes in the total amount on which the 12.5 percent royalty is computed.

277,633

— 67 —

PRODUCTION TAXES

The present Texas production tax is at the rate of 7 percent of lease revenues. Production taxes in New Mexico are somewhat lower than in Texas. The presiding examiner used a weighted average of Texas and New Mexico production taxes, which he computed to be 6.42 percent after taking into account the latest increase in New Mexico taxes.

We think that reasonable local taxes are a valid basis for a difference in ceiling prices between one area and another and if reasonable the tax applicable in each state should be applied to the gas produced in that state. The 7 percent tax in Texas is at approximately the maximum level of taxes which we have allowed to be passed on by the producer to the purchaser. Accordingly, the full amount of taxes actually incurred either in Texas or New Mexico will be allowed as a component of the total price per Mcf of gas. Since the greater part of gas produced within the Permian Basin is subject to the jurisdiction of the State of Texas, all ceiling prices set forth in this opinion will be stated in amounts applicable to gas produced within the taxing jurisdiction of that state. However, the ceiling price for sales in New

Mexico will reflect the applicable tax in that state and will, accordingly, be at lower levels.

In the event of any increase in taxes in Texas or New Mexico, the Commission will consider whether ceiling prices shall be increased and, if so, to what extent.

The ceiling price here established will be the total amount to be paid by the buyer of gas, including all tax reimbursements provided by contract.

277,634

— 68 —

INCOME TAXES

Respondents presented no evidence that any income tax allowance should be included in the computation of cost of new gas-well gas. Their witnesses, Park and Keane, included no such allowance. At stated by the examiner, the testimony of Staff Witness Lyon shows that if the industry's growth is considered, there will be no Federal income tax liability at any return up to 15 percent. The Major Producer Group argues that 0.6 cent per Mcf should be included in the cost computation, representing income tax liability upon a return at the rate of 12.5 percent based on testimony by Witness Roseman. However, Roseman qualified his calculation by stating that many major companies in the past have been found to pay no income taxes, and that there is no evidence that taxes would in fact be paid. He further indicated that his computations should be revised in the light of additional data which was never introduced into the record.

In these circumstances we think the analysis of Witness Lyon was properly accepted by the examiner and we affirm his conclusion on this issue.

THE RATE FOR NEW GAS-WELL GAS

As we have stated the basic standard for determining the price of new gas-well gas is the cost-finding technique we have employed herein. However, in determining the price for each particular area the Commission must, of course, consider other relevant factors in the area. The factors which are commonly considered in the design of rates include the impact of the prescribed rate on existing rate structures, the quality of the gas in the area, the historical prices in the area and other such factors.

The presiding examiner made two adjustments from his cost base on account of such factors in designing his ceiling price for the Permian Basin. Both were of major size. One was a downward adjustment of 1.25 cents in the ceiling price for new gas-well gas (his so-called "location factor") to reflect the fact that historically the average initial price for new gas in the Permian Basin has been lower than the comparable price in the 7 southwestern

states.[30] The second adjustment was in the other direction and consisted of an addition of 1.0 cent as a so-

[30] He used the seven southwestern states because figures for continental United States were not available.

called "gold standard" to reflect the fact that much of the gas in the Permian Basin was of less than pipeline quality and his view that such a premium should be permitted for pipeline quality gas.

We do not believe that either of these adjustments is appropriate. Rates should of course be designed so as to minimize any disturbances of existing pricing patterns to the extent possible consistent with the basic regulatory standards. However, nothing in the record in this case suggests that the ceiling prices we are prescribing for the Permian Basin require any such adjustments. No adjustment for "location factor", whatever that vague concept may mean, is required or is appropriate in this proceeding, either in the amount prescribed by the examiner or in any other amount.

As to the "gold standard" adjustment, we have made clear that the ceiling prices prescribed herein apply as true ceilings for gas or pipeline quality and we have accordingly prescribed standards of pipeline quality. These standards provide for both upward and downward adjustments in the ceiling price for new gas-well gas. The record is deficient as to the overall financial impact of these adjustments but in our determination of rate of return we have recognized that producers in the Permian Basin incur the risk that the gas they find and produce may not command the ceiling price. The absence of any definitive record support for a "gold standard" adjustment coupled with our reflection of the quality problem in fixing the rate of return satisfies us that area revenue requirements will be met.

In summary, when all of these factors are considered there is no justification in this area for any adjustment of a cost-determined ceiling price. We state again

that the ceiling price we are here establishing is for the Permian Basin and that it is entirely possible that in other areas non-cost considerations may require adjustment of the cost figures in establishing the ceiling prices. We hold only that no such adjustments are required in the Permian Basin on the basis of this record. Accordingly we shall round off the cost determined price of 16.43 cents and prescribe a ceiling price for new gas-well gas of pipeline quality in the Permian Basin at 16.5 cents per Mcf at 14.65 psia for gas produced and sold in Texas. The ceiling in Texas includes a production tax of 1.01 cents, which we round off to 1.0 cent, leaving a rate less production taxes of 15.5 cents. For gas produced and sold in the three New Mexico counties, Chavez, Lea and Eddy, the ceiling price shall therefore be 15.5 cents at 14.65 psia plus the applicable production taxes in effect as of the date of this opinion. These prices will apply to residue gas derived from new gas-well gas (see discussion pp. 75-76).

RATIONALE FOR A UNIFORM CEILING PRICE FOR FLOWING GAS

Casinghead Gas

Casinghead gas is the common name for gas produced from oil wells in conjunction with the production of oil.

For purposes of the application of our ceiling prices herein, we shall follow the existing classification of casinghead gas by the appropriate state agency. Casinghead gas is often higher in Btu content than either residue or gas-well gas, and usually contains valuable liquids which are extracted before the gas is delivered to a pipeline. Casinghead gas is often delivered at low pressures, sometimes as low as 5 psig. Since oil wells in the Permian Basin are subject to restraints imposed by state regulation upon the amount of oil produced, casinghead gas can be obtained from a given well only for the period each month that oil is under state oil production controls. Correspondingly since oil is the major product of an oil well, taking the casinghead gas cannot be deferred for any length of time for the buyer's convenience; it must be taken at the time the oil is produced, and the amount of gas is related to the oil production.

Accordingly casinghead gas is not subject to the exclusive control of the buyer as to time of delivery. Ordinarily, however, processing plants will schedule deliveries from the various wells which they service in such manner as to maintain a substantially even output, so that irregularities in deliveries from particular wells are overcome to some extent for the pipeline purchasers from the processing plants. Nevertheless, this limitation on the deliverability of casinghead sometimes requires the pipelines to draw on additional gas-well gas to meet their commit-

ments, and gas-well gas sources therefore provide a valuable flexibility in meeting the peak requirements of the pipelines.

Most of the casinghead gas sold in the Permian Basin is sold to processing plants under percentage contracts, which provide that the processors shall pay to the producers a stipulated percentage of the price which the processors receive upon sale of the residue gas plus an agreed percentage of the proceeds of sale of the extracted liquids. Under these arrangements, the price paid by the processor is immaterial to the consumer so long as the price of the residue gas conforms with the ceiling price established for such gas in this proceeding. The processor is controlled by certificate and rate schedule filings and producers who sell casinghead gas under such percentage contracts are not permitted to file rate schedules with this Commission (Regulations Under the Natural Gas Act, Sec. 154.91(e)). So far as such producers are concerned, any separate ceiling price for casinghead gas would have no application.

The second major type of contract under which casinghead gas is sold in the Permian Basin is the so-called Spraberry or El Paso contract. These contracts provide for the purchase of casinghead gas by a pipeline which processes the gas, pays the producer a percentage of the proceeds from the sale of the extracted liquids, plus a fixed price for the residue gas delivered to the

pipeline. The examiner held that the payment arrangements provided for in the Spraberry contracts must be discontinued. He fixed ceiling prices of 10 cents per Mcf for old casinghead gas and 11 cents per Mcf for new casinghead gas, to be paid for the raw stream (including liquids) without any additional compensation to the producers in the form of a percentage of the liquids or of the price received for them. In effect he outlawed the Spraberry contracts and declared that only a flat amount, limited by the separate casinghead gas ceilings, could be paid for casinghead gas purchased under the Spraberry contracts.

The Major Producer Group has taken strong exception to this ruling, contending that pipelines will not be able to purchase casinghead gas if the presiding examiner's proposal is implemented because producers would then prefer to sell to the processors under percentage contracts. They also assert that the Commission has no jurisdiction over the division of the extracted liquids.

We believe the presiding examiner was correct in holding that the sale of the casinghead gas to the pipeline under the Spraberry type contract is subject to Commission jurisdiction, and that this Commission has the power to regulate the price for the raw gas purchased even though it may include the heavier molecules which can easily be liquified. The form of the contract provides for the transfer of title to the gas as casinghead or raw

NCR

CARD 21

stream gas but the method of payment is based upon a specified price per Mcf for the residue volumes of gas and a percentage payment of liquid revenues. The Commission has no jurisdiction over the price at which liquids are sold but if payment for the raw stream is made in whole or in part on the basis of a percentage of liquids or liquid revenues, the Commission may still consider the liquid credits in controlling the amount of the payment for the gas.

The fact that the transaction is subject to our jurisdiction does not mean, however, that we must reject a common form of contract which has been found useful in the industry. We believe that regulation should utilize industry practices developed by the parties to meet industry problems to the extent consistent with maintaining effective regulation. The Spraberry contracts govern approximately 20 percent of the gas sold in the Permian Basin, and we do not think they should be discarded unless it can be shown that they give rise to abuses or evasions, or result in unjust and unreasonable prices to consumers. So long as the cost to the pipelines for residue gas under the Spraberry contracts does not exceed the applicable ceiling price for gas of similar quality, we see no reason to require the elimination of the Spraberry contracts.

There is no evidence in this proceeding that the pipelines' cost of gathering and processing the casinghead gas

purchased under Spraberry contracts is greater than the revenues realized by the pipeline from the liquids extracted. As long as the liquid revenues to the pipeline equal or exceed the processing and gathering costs the consumer will be adequately protected by the ceiling here established for residue gas. If the cost of gathering and processing exceeds the pipelines' liquid revenues by an amount which, if added to the price paid for the residue gas, would exceed the ceiling price applicable to residue gas of similar quality, and appropriate reductions of the price cannot be negotiated, the purchasing pipeline may petition the Commission for relief pursuant to Section 5(a) of the Act by ordering an appropriate reduction in the price the pipeline pays for such residue gas.

Aside from gas sold under percentage contracts and Spraberry type contracts, only a negligible amount of casinghead gas is sold in the Permian Basin. In 1960, only three such contracts involved sales in interstate commerce of Permian Basin casinghead gas to pipelines. These contracts involved total revenues of less than $200,000 in 1960. The impact of these contracts upon prices to be paid by the ultimate consumer is *de minimis*. The contract prices were all under 14 cents. Additional reductions in price for quality deficiencies would reduce the actually realized prices still further. The effect of these contracts is too small to warrant the establishment of a separate ceiling price for casinghead gas.

Aside from percentage contracts, there are also few contracts for sales in interstate commerce of casinghead gas to producer-owned processing plants in the Permian Basin. These contracts will have no direct effect upon the cost to the pipelines and the ultimate cost to the consumer, since the resulting residue gas sold by the processing plants will be subject to the ceiling price herein established for residue gas derived from casinghead. In the event it should be determined that these contracts have a sufficient effect upon the cost of the processing plants so that the latter must seek relief before this Commission, we may then consider whether the prices under such contracts must be subjected to additional regulation. The record in this proceeding does not reveal the need for any such regulation. In general, the prices under such contracts are at sufficiently low levels so that the processors should be sufficiently protected. We establish herein a ceiling price for all gas (except new gas-well gas and residue derived therefrom) which will be applicable, of course, to such contracts.

We believe it is of great importance to simplify the system of area rate ceilings to the extent practicable consistent with an effective system of price controls. In this light we conclude that there is no need for a separate casinghead gas ceiling in the Permian Basin at this time. In the future, should the lack of such a ceiling be found to encourage evasions of the general price ceiling, a

separate ceiling price for casinghead gas may be established. With respect to the Spraberry contracts and all other contracts which, in addition to a payment for residue gas, call for payment for a percentage of liquids or turning over a percentage of the liquids to the producer, any alteration in the price paid for the residue gas or the percentage of the liquids due to the producer will be considered a rate change which must be filed with this Commission and the right to make such rate changes will be subject to the moratorium on rate increases imposed herein. Future contracts embodying such provisions are to be certificated only where the liquid percentage to be retained by the processor or the pipeline equals or

exceeds the cost of gathering and processing performed by the processor or pipeline, or where the price to be paid for the residue gas is reduced below the applicable ceiling sufficiently to offset processing and gathering costs in excess of the value of the liquids retained by the processor or pipeline. In the absence of a contrary showing, percentages similar to those now in effect will be assumed to be compensatory and will be approved in future contracts for comparable gas under comparable circumstances.

Residue Gas

Residue gas is the gas remaining after casinghead gas or gas-well gas has been processed to remove liquids pres-

ent in the raw gas stream in the form of vapor or droplets. Only three to four percent of the residue gas produced in the Permian Basin is derived from gas-well gas; between 96 and 97 percent comes from casinghead gas.

Residue gas in the Permian Basin is delivered at somewhat lower pressures, on the whole, than is gas-well gas. Most residue gas is delivered at pressures below 800 pounds, but deliveries of gas-well gas at pressures of 1,000 pounds and up are not uncommon. The cost of raising the pressure of gas to a given point is not proportionate to the added pressure, but is determined by the number of stages of compression (and the compression ratio) necessary to create the desired pressure. To raise the pressure of gas from 600 pounds to 800 pounds will normally cost little more than to raise it from 700 pounds to 800, since in each case only one stage of compression will be necessary.

For purposes of applying the area prices prescribed herein, the ceiling price for new gas-well gas will be applicable to residue gas which is derived from new gas-well gas and the ceiling price for all other gas will be applicable to residue gas derived from casinghead gas or old gas-well gas.

277,642

— 76 —

We regard our determination that all gas should be priced on the same basis as old gas-well gas (except for the top ceiling we have established to encourage the

search for new gas-well gas which is applicable to such gas whether or not it has been processed) as an important step toward simplified and realistic area price regulation. It is apparent, on this record, that no realistic cost of oil-well gas either as casinghead gas or residue gas can be established and that the various apportionments of the joint costs of gas and oil, or gas and liquids, do not yield results which may be accepted as reliable guides. The evidence in this case and the practical administration of area prices dictates that casinghead gas, residue gas derived therefrom, and old gas-well gas, should be similarly priced. Unlike new gas-well gas, there is no basis on this record for differentiation because of the incentive effect, or otherwise.

The examiner would provide separate ceiling prices for old residue gas and new residue gas. We do not believe such a complication of the area pricing structure is necessary or desirable. We have already made clear that the higher ceiling price for new gas-well gas will apply in the case of residue gas derived therefrom. However, over 96 percent of the residue gas produced in the Permian Basin is derived from oil wells, not gas wells. It results from the search for oil, which will not be stimulated appreciably by a higher price for gas. There is thus little to be expected in the way of increased gas supplies from providing a higher price for such residue gas. All residue gas derived from oil-well gas, therefore, will be subject to the same ceiling price as old gas-well gas.

As stated above, we adopt the presiding examiner's finding that residue gas derived from new gas-well gas is to be subject to the new gas-well gas ceiling. If this were not the case, producers of new gas-well gas would be deterred from selling such gas to a processor from whom they were unable to obtain new gas-well gas prices. With equal prices, gas-well gas will be sold to a processing

plant whenever the sum received for the liquids exceeds the cost of processing. This is as it should be for it would be contrary both to good conservation practice and good economics for price regulation to interfere with the normal operation of market forces where these forces tend to provide the greatest possible benefits to the economy as a whole.

Hunt urges that residue gas must be priced higher than gas-well gas so that a processor selling residue gas can cover his processing costs plus a return on his investment in addition to the price of the gas-well gas he purchases. This reasoning ignores the fact that saleable liquid hydrocarbons are derived from the gas that is processed. The principal purpose of such processing is the removal of these liquids so that revenue may be realized from them. There is every reason to believe that the value of the liquids will be sufficient to justify gasoline plant processing of new gas-well gas. If not, there is no apparent economic reason to encourage the processing at gasoline plants.

We therefore reject the argument that the price of residue gas derived from gas-well gas should exceed that of gas-well gas. For the future, if processors of gas-well gas cannot buy gas-well gas at a price which enables them to make a profit on their operations at the ceiling prices we prescribe, we assume that such gas will not be processed by the producers. As to presently existing contracts by processors for the purchase of gas-well gas, if proper price relationships cannot be negotiated relief may be afforded in a proper case under the special relief provisions set forth later in this opinion. There should be very few of such cases, in view of the extremely small percentage of residue gas derived from gas-well gas.

The Rate for Flowing Gas[31]

Basic Approach

In the previous section we explained why a separate ceiling is not appropriate for casinghead gas or for residue gas derived therefrom and why the cost of old gas-well gas may appropriately constitute the basic yardstick for establishing a single ceiling price applicable to all gas

[31] The term flowing gas in this section will be used to include all gas other than new gas-well gas or residue gas derived therefrom. It includes old gas-well gas, all casinghead gas, and residue derived from old gas-well gas or casinghead gas.

other than new gas-well gas. We proceed with a determination of the cost of old gas-well gas.

The examiner determined the cost of old gas-well gas by employing virtually the same method he used to establish the price of new gas-well gas, with certain cost components adjusted by trending to approximate cost levels in the prior years when the old gas-well gas entered the interstate market. The State of California and the Public Utilities Commission of California have urged that the historical composite cost-of-service for the Permian Basin area based on questionnaire data be used to determine the price of old gas-well gas. Staff's basic case consisted of a composite historical cost-of-service presentation which California Distributors and Staff in its reply brief suggest should be used as a check on the examiner's method of computation of the cost of old gas-well gas.

As we have previously found, the examiner's method which is designed to approximate needed expenditures for finding and producing future gas-well gas supplies is the proper one for fixing the price of new gas-well gas. However, flowing gas is in a different category. Changes in the price cannot increase substantially the total amounts of gas which are already dedicated to interstate commerce[32] nor can they materially affect the supply of oil-well gas which is discovered as a by-product of the search for oil, although they could to some extent affect

---

[32] To a small extent the price might affect the stage at which wells are abandoned because the proceeds of operation do not defray out-of-pocket costs.

the amount dedicated to interstate commerce in the future. The revenues received from flowing gas, should, therefore, be based on composite historical costs, including a fair allowance for expenditures for E & D. The price for flowing gas must also reflect the producers' need for revenues from their present sales to support future discoveries.

We believe that the most solid basis in the record for determining the just and reasonable price of old gas-well gas is the composite cost-of-service presentation for the Permian Basin made by the Commission's Staff. The presentation uses 1960 as a test year to determine the cost of old gas-well gas. An approach based on historical costs for flowing gas enables us to draw on the cost finding techniques applied in previous producer cases on an individual company basis. We shall, therefore, use the composite historical cost-of-service for old gas-well gas, for the 1960 test year, as the basis for the flowing gas price. While we place primary reliance on Staff's cost-of-service presentation, we shall later show that the examiner's method of trending back the new gas-well gas cost yields approximately the same cost and thus serves as a useful verification of our result.

It should be noted that we are utilizing a different cost-finding approach for flowing gas than that used in calculating the cost of new gas-well gas. The cost of new gas-well gas was geared to the cost of finding and

producing future gas supplies and as such was built up primarily from nationally published statistics and the questionnaire data which to a large extent identified costs that could be related to gas-well gas. We were thereby enabled to minimize the need for allocations. However, with regard to flowing gas our touchstone is the historical cost of the gas being produced in the Permian Basin in 1960. The primary data includes joint product lease costs and joint E & D expenditures, whereas for new gas-well gas the parties developed cost-finding techniques that minimized the allocation problems. In deriving the cost of the flowing gas-well gas, therefore, it is necessary to utilize allocations to a greater degree than for new gas-well gas (although to a much less extent than with casinghead gas) and for this reason the details of the cost computations of new gas and flowing gas will not be comparable.

277,646

— 80 —

The basic evidence utilized in Staff's composite cost presentation was collected for 1960. In addition, certain trend information was obtained for prior years. These and related data reveal that the 1960 level of costs is fairly representative of the costs during the three year period ending in 1960. While unit costs were somewhat lower in the earlier years, they leveled off in 1958 and so far as the evidence shows have never since exceeded this level. The 1960 test year is, therefore, typical of current and future costs of the flowing gas and it is also

more than fair to the producers as a basis for just and reasonable prices for the prior years when costs were slightly lower. The alternative of a separate cost study for each of the years prior to 1960 would have presented an almost impossible task. At best it would have prolonged this proceeding greatly. Such an effort was not justified since little gas was selling in the 1954-1957 period at prices even approaching our ceiling as established herein.

Preliminary Questions

An initial question in using the composite cost-of-service approach for determining the rate for flowing gas is whether production costs should be determined on the basis of nationwide costs incurred by the producers operating in the Permian Basin or whether their Permian costs alone should be used. While the staff presented its evidence derived from the questionnaires to show costs both ways, it argued that the emphasis should be on the Permian Basin cost experience. The producers, on the other hand, argue that the nationwide basis should be used.

Other than for E&D, the data is available in the record to determine the costs incurred in the Permian Basin. The ceiling price we fix herein is an area rate for flowing gas in the Permian Basin, not a national price, and in our opinion should be based primarily on area costs.

The Major Producer Group argues that if area costs are used the demand for gas would tend to concentrate in the lower cost and lower priced areas at the same time that the lower

prices would tend to discourage exploration and restrict supply in the area. This argument, if valid at all, would apply only to new gas-well gas where the price we fix could materially affect future discoveries, and there we rely on national data. We are here determining costs and rates for flowing gas in the Permian Basin and for such gas we shall, therefore, use Permian costs to the extent feasible.

While the principle is important the issue is not a major one in this area because the difference between national and area production costs is approximately 0.25 cents per Mcf in Staff's presentation.

A further preliminary question arises as to the use of the questionnaire data from Appendix C, the simplified form designed for producers with less than 10,000,000 Mcf of annual jurisdictional sales in 1960. The Commission's Appendix B is a comprehensive questionnaire designed for the major producers, those with 1960 jurisdictional sales in excess of 10,000,000 Mcf. Replies to the major questionnaire (Appendix B) were received in complete form from 67 respondents in the area. These respondents included 42 major producers[33] and 25 producers of less than 10,000,000 Mcf who voluntarily com-

[33] This total includes all the major producers in the area, except one who did not fill out the questionnaire in a usable manner, although given ample opportunity to do so.

pleted the form.[34] Appendix C questionnaires were mailed to all of the over 350 small producers in the area but responses were filed by only 105 of them. Of these only 60 were sufficiently complete to be compiled. The Commission's staff computed the results of the responses to Appendix C separately but included the Appendix C data in its composite cost of service.

The examiner concluded that the data provided by the major producers with respect to their Permian production was fully representative of area costs, but that the response from the small producers in the Appendix C group could not be used because the percentage coverage of the small producers was not large nor was the same sample random.

We agree with the reasoning of the examiner. The issue is of a *de minimis* nature in any event because the percentage of gas produced in the Permian Basin by such producers is so small so that the results could not be affected appreciably. The unit cost of gas in this proceeding would be increased by less than 0.07 cents per Mcf even if Appendix C returns were included. In these circumstances we shall rely exclusively on the Appendix B cost data.

---

[34] The returns from these 25 producers do not affect the cost computations to an extent that would change the results.

The Composition of Costs

The total costs upon which the price for flowing gas is to be based may be divided into two principal categories: (1) production costs, which include operating expenses and DD&A (depreciation, depletion and amortization), as well as a return on the production investment and (2) exploration and development costs (E & D), which includes an allowance for the expenses incurred in the search for gas. We are not concerned with the gasoline plant costs which the staff considered and treated at some length because, as already explained, in this area we are determining a price based on the cost of gas-well gas which will also apply to residue gas from other than new gas-well gas.

Production Costs

The compilation of the production costs by the staff is essentially the task of compositing by type of lease the items reported by the producers in response to the Commission's questionnaire and allocating the costs between gas and other products. The allocation problems which we shall discuss herein are the principal difficulties, but there are a number of other issues which must be resolved. They include the treatment of combination leases, corporate common costs, reinjected volumes, the development of oil and gas legs for

allocation of production costs, and lease play allowance. These somewhat technical issues are discussed in Appen-

dix C to this opinion. Otherwise the computation of the composite unit costs of production operating expenses, the composite rate base and the allowance for DD&A, simply involve the arithmetic of compiling the appropriate data. The results are shown in the summary at page 85.

Allocation of Production Costs by the Relative Cost Method

There is of course no allocation problem in computing the production costs of dry gas-well gas. However allocations are necessary for the gas from gas condensate reservoirs. In computing the production operating costs for flowing gas-well gas we shall utilize the relative cost method to divide the joint production costs between the liquids and the gas on the gas condensate leases with lease separation.[35] The basic rationale of the relative cost method is that joint production costs should be allocated in relation to the separate production costs of oil and gas. This method is analogous to the procedure used by United States agencies and approved by this Commission to allocate the cost of a multi-purpose hydroelectric dam between power, flood control and other beneficial uses.[36] The cost of the portions of a dam used for more than one purpose is allocated in accordance with

[35] "Lease separation" refers to the separation of condensate liquids from the gas on the leased property, rather than by later processing.

[36] See, for example, order issued March 5, 1965, in Docket No. E-6383, Allocation of Costs, McNary Project, Columbia River Washington-Oregon, and attached Bureau of Power report.

the relative cost of a separate dam or other required facility for each purpose. Here the relative cost of each coproduct, gas and oil, is used as the basis of allocating the cost of producing the two products jointly.

The first step in the relative cost method is to determine the unit cost of oil from leases producing oil only (the "oil leg") and the unit cost of gas from leases producing gas only (the "gas leg"). The unit cost for each of the two separate products is then multiplied by the volumes of liquid and gas produced on the joint production leases. This provides a total relative cost for the liquids and gas produced on such leases and a ratio of gas cost to

total cost. This ratio is then applied to the total cost of the gas condensate leases in order to obtain the unit costs as they apply to the jointly produced gas.

While producer-respondents and the presiding examiner have questioned the use of the relative cost allocation method, it is relatively simple and workable, has been accepted in principle in our electric power work for decades, and has been repeatedly used and approved by the Commission in producer rate cases. *Phillips Petroleum Co.*, 24 FPC 537 (1960), affirmed *sub nom. Wisconsin* v. *F.P.C.*, 303 F. 2d 830 (1961), affirmed 373 U.S. 294 (1963), especially at pages 553 *et seq.*; *Hunt Oil Co., et al.*, 28 FPC 623, 624 (1962). The reasoning which supports the relative cost method of

allocation in computing individual company costs is equally applicable to composite area costs. The detailed application of the method and the arguments against it are dealt with in Appendix C.

Rate of Return

Among the most important issues is the rate of return for flowing gas. We have already discussed in detail the many factors which led us to conclude that a 12 percent return is appropriate. Two of these factors warrant a somewhat different treatment in considering the appropriate return for flowing gas. First, the great bulk of the flowing gas was not found as the result of exploration or development directed toward gas but rather as an incident to the search for oil. In evaluating the risk factor for flowing gas we must therefore consider that there was by no means the same degree of risk knowingly undertaken in finding such gas as in the case of new gas-well gas. On the other hand, much of the flowing gas in the Permian Basin is below pipeline quality and thus will not command the ceiling price prescribed herein and this problem of low quality is more pronounced in flowing gas than in new gas-well gas.

In our judgment these two factors of lesser and greater risk considered together with the other considerations in our previous discussion of rate of return, which apply equally to flowing gas, persuade us that a 12 percent return is appropriate. Also relevant to our conclusion is the fact that revenues from flowing gas are a factor in the

scale of exploration for new gas. Moreover, flowing gas includes new accretions of casinghead gas and residue gas resulting therefrom, the price of which may well determine the extent to which such gas is committed to the interstate market. Accordingly, we shall allow a 12 percent return on flowing gas.

Summary of Production Costs

Employing the relative cost method, making the other necessary determinations as discussed in Appendix C, and using the 12 percent rate of return, we arrive at 9.16 cents per Mcf for production costs, consisting of the following:

Production operating expenses	1.75
Depreciation, depletion and amortization	2.42
Return	4.99
	9.16

Exploration and Development Costs

Exploration and development costs pose a different problem than production costs. E & D covers dry hole expenses, geological and geophysical expenses, lease rentals, cancelled and surrendered lease expenses, and all other costs expended on nonproductive properties in the effort to find gas. Expenditures for E & D are not earmarked for particular producing areas but on the contrary are incurred on a nationwide basis by the major producers, who make these expenditures largely in accor-

dance with prospects for discovery rather than on an area-directed basis. No one disputes the fact that the E & D allowance for flowing gas should be computed on a nationwide basis.

The principal problem is the proper allocation of total E & D expenditures between gas and liquids. The allocation problem is illustrated in our *Phillips* opinion, 24 FPC 537, 555-562 (1960). After closely analyzing many possible allocation approaches the Commission adopted the use of the modified Btu method in the *Phillips* case and reaffirmed it in *Continental Oil Company*, 27 FPC 96, 104 (1962); *Hunt Oil Company*, 28 FPC 623, 624 (1962); and *H. L. Hunt*, 28 FPC 897, 901 (1962).

The modified Btu method of allocation in the *Phillips* case was designed to utilize as a basic standard the relation of the fuel value of gas to the fuel value of oil, but at the same time adjust this relationship to reflect economic trends and the needs of the public for continued exploration and development. Thus the Commission considered not only the ratio of Btu's in a barrel of oil and in an Mcf of gas (about 6 to 1 for *Phillips* production), but also the increasing demand for gas compared to oil, the deeper drilling needed in exploring for gas, the upward trend of gas production, the ratio of the market price of gas to the price of oil, and other matters. Emphasizing that its determination was based on judgment, the Commission determined that an economic

factor of 4 should be applied to the Btu content of oil to allocate *Phillips'* exploration costs. The resulting cost relationship of finding an Mcf of gas to one barrel of oil was then about 1 to 24, rather than 1 to 6 as on a straight Btu basis. The Commission pointed out that the result might well be different in a case, unlike *Phillips*, where rates were being determined for the future.

In the present area proceeding Staff, through Witness Lyon, advocated the general method used in *Phillips*, with certain refinements, the principal one being the use of separate economic factors for gas-well gas and casing-head gas, in place of the single factor provided in *Phillips*. The total national costs were apportioned by the Staff to the lease products on the basis of these factors, the amounts so allocated were divided by the respective national volumes of the lease products to determine national unit allowances, and these unit values were then imputed to the Permian sales.

The respondents proceeded differently. They propose to allocate the expenses of developmental dry holes on the basis of the well drilling intentions of certain producers who were polled, the expenses of exploratory dry holes on the basis of intangible drilling costs associated with successful wells, and remaining exploratory expenses on the basis of successful expenditures for gas reservoir reserves compared to oil reservoirs. For the separation of gas and condensate, respondents would convert the condensate back to vapor and allocate costs on the basis of the relative vapor volumes of the gas and the condensate.

The examiner correctly found the respondents' method unsound because it ignores the economic purpose of the driller. While a barrel of condensate is worth some 20 times the value of an Mcf of gas, under the producer's vapor volumetric method an Mcf of gas would be assigned about the same E & D expenses as a barrel of liquids which vaporizes to about the same volume as an Mcf of gas. We may also note that in the allocation of developmental dry hole costs there was a considerable degree of self-selection in the responses from the polled producers. Expressions of "intention" also involve subjective considerations. The data obtained are not the result of a random sample of all producers on an objective basis and do not offer a reliable foundation for fixing prices.

We have reviewed the evidence in the record on this issue and believe that Staff's general approach to the problem is sound but that the breakdown between gas-well gas and casinghead gas is an unnecessary complication of the allocation procedures.[37] The issue is one of exercising reasonable judgment in allocating the total cost between the coproducts.

The basic staff method has been attacked by both the producers and the examiner as being circuitous, in that

[37] The further breakdown between gas-well gas and casinghead gas would result in only a difference of 0.12 cents in the E & D expense allocated to flowing gas-well gas and involves the use of questionable value differentials.

the existing price of flowing gas-well gas is used as one of the bases for determining what the price of flowing gas-well gas should be. We are now able to remove an element of circuitry from such an allocation by reason of the fact that we have computed a cost of new gas-well gas of 16½ cents per Mcf by an independent cost finding technique. We are thus able to relate the price of oil fixed by the marketplace to a separately established price of gas, to aid us in making these allocations.

The record indicates that the 1960 average price in the field for liquids is $2.90 per barrel which would be related to the 16½ cents per Mcf price of gas which we have established herein. The questionnaire data in this record reveals that the ratio of Btu's in a barrel of liquids to Btu's in an Mcf of gas-well gas is 5.1 to 1. Utilizing this Btu ratio and the independently established

prices previously mentioned we arrive at a value relationship of a Btu of liquids to a Btu of gas-well gas of 3.45 to 1.[38]

There are other factors which must be considered in arriving at the economic factor for determining the appropriate allocations of E & D expenses between gas and oil. One such guide is the fact, established in the record, that the production costs of a Btu of oil are roughly 4½ times

[38] The price ratio of $2.90 per barrel of oil to 16.5 cents per Mcf of gas is 17.6 to 1. This ratio is then divided by the 5.1 to 1.0 Btu ratio to determine the value relationship of 3.45 to 1.

that of a Btu of gas. Another factor to be considered is that the 16½ cents price is one that we have determined to be appropriate for the future for new gas-well gas and that the price of gas moved sharply upward during the 1950's in relation to the price of crude oil. We must also consider that we are determining a cost to be used for fixing prices for flowing gas for the future as well as for the past.

These considerations and the other data from the record relating to the allocation question, lead us to conclude that in allocating total E & D expenses, an economic factor of 3.5 should be applied to the Btu's of crude oil and condensate liquids production as compared with an economic factor of 1.0 for the Btu's of all gas. Allocations on a Btu basis so adjusted in our judgment will give proportionate weight to the costs, prices, quality and other economic relationships of the respective hydrocarbons.

We also believe that these relative weightings should be applied to the national production of hydrocarbons, rather than to the Permian Basin production because E & D is conducted on a national basis.[39]

Applying these factors to the national production, the E & D costs for flowing gas-well gas would be 4.08 cents. The details of the computation are shown in Appendix C, pages 11-12.

[39] There is in this case little difference in the practical result, since the application of these factors to area production rather than to national production would change the results of the cost computation by approximately .01 cent.

Summary of the Cost of Flowing Gas

The cost of old gas-well gas may therefore be summarized in accordance with the evidence presented by Staff and the discussion above as follows:[40]

[40] There is no separate item for royalty payments because costs were computed on the basis of ⅞ of the actual volumes and the royalty payments were thus included as an integral part of the cost-of-service computations.

Production	9.16
Exploration and Development	4.08
Regulatory expense (see p.)	.14
	13.38
State production tax @ 7%	1.01
Total	14.39

COMPARISON WITH EXAMINER'S COMPUTATION OF COST OF OLD GAS-WELL GAS

As we noted at the outset we place primary reliance on the historical test-year cost of service presentation. However, the examiner's method of computing the cost of old gas-well gas, with the revisions we think necessary, serves as a useful check on the results. It yields a cost closely comparable to that derived from the more traditional cost-of-service approach.

The examiner found that the cost of old gas-well gas should be fixed at the average cost of gas-well gas

produced in 1960. Gas produced in 1960 resulted from exploration and development conducted in some cases many years before, and the cost of drilling and equipping wells which produced gas

in 1960 was incurred in years ranging over a span of two decades. Accordingly, the examiner adjusted his exploration and development costs to reflect the lower cost in earlier years.[41]

We think that the procedure used by the examiner to arrive at his old gas-well gas cost is reasonable but that certain items of his computation require revision.

The examiner found that total exploration and development costs for old gas (dry-hole costs, other exploration and development expenses, and allowance for growth) should be 25 percent below the figure of 4.12 cents per Mcf applicable in the case of new gas-well gas.

[41] In view of the impracticability of determining such costs directly, the examiner used the following procedure, outlined in Appendix C to the initial decision: "The purpose of this analysis is to compare the average finding cost of old gas well gas (the gas produced in 1960) with the cost of finding new gas well gas (the reserve additions found in 1960). The general procedure follows these main steps: (1) the total volume of gas well gas produced in 1960 is distributed by estimated year of discovery; (2) the volume associated with each year of discovery is weighted by an index of drilling cost per MCF for that year (1960=100); and (3) the results are totaled and then divided by 1960 production, thereby deriving a weighted average finding cost for the gas produced in 1960 relative to the finding cost of gas well gas found in 1960. The basic data for this analysis consists of: (1) production of gas well gas reserves; (2) estimates of annual additions to gas reserves; and (3) indices of annual drilling costs per Mcf of reserves added."

This discount yielded a figure of 3.09 cents per Mcf for exploration and development. Production investment costs, DD&A and return, were similarly discounted 25 percent from the 3.95 cents and the 5.21 cents, respectively, applicable in the case of new gas-well gas, yielding a DD&A of 2.96 cents per Mcf and a production investment return of 3.91 cents per Mcf applicable to old gas-well gas.

Unlike production investment costs, exploration and development costs are not capitalized in our decision in this proceeding. They are expenses to be recouped by a producer in the year in which they are incurred. The fact that a lower original investment was necessary to

produce gas flowing in 1960 does not affect the exploration and development expenses incurred in that year. Accordingly, these costs should not be discounted, but should be the same as those included in the computation of the cost of new gas-well gas. We shall therefore allow the same amount for E & D as we permitted in the price of new gas-well gas.

In computing the production investment for old gas-well gas staff contends that it should be 84 percent of the new gas-well gas investment cost rather than 75 percent as a result of two revisions of the examiner's method. Staff accepted the examiner's method of deriving the cost of flowing gas-well gas; however, it proposed an 84 percent rather than a 75 percent discount factor as a result of two revisions of the examiner's method.

Staff's first revision of the examiner's approach was a technical adjustment of the annual index of drilling and equipping costs per Mcf added. The examiner's index measures the trend of the allocated cost of total gas reserves added (gas-well gas and oil-well gas), whereas Staff's index measured a trend of unallocated gas-well costs per Mcf of gas-well gas only reserves added. Since we are deriving a gas-well gas cost it appears that Staff's index is preferable to the examiner's index. Staff has utilized an index which produces a result approximately the same as the examiner's but avoids many of the complicated allocations. Accordingly, we will use Staff's index of drilling and equipping costs.

Staff's second revision of the examiner's backtrend method was to apply its national drilling and equipping cost trend to the vintage mix of jurisdictional gas-well gas produced in the Permian Basin rather than applying the cost trend to the vintage mix of all flowing gas-well gas on a nationwide basis, as was done by the examiner. We have determined that the ceiling price for flowing gas-well gas should be fixed primarily on historical costs in the area (*supra*, 78-79, 80-81). Therefore, the gas-well gas cost trend should be applied to the vintages of gas-well gas in the area.

These adjustments result in a figure of 3.32 cents for DD&A and 4.38 cents for return on production investment rather than the 2.96 cents and 3.91 cents, respectively, used by the examiner.

(277,658)

With respect to all other items we shall follow the examiner's technique and use the same items of cost as used in the new gas-well gas computation. With respect to the amount for net liquid credit a word of explanation may be in order. The Commission concluded that the net liquid credit should be 3.10 cents per Mcf, rather than 2.68 cents per Mcf as allowed by the examiner. The Commission based its determination primarily on questionnaire data but in our discussion we pointed to the trend in recent years toward increased realization of condensate per Mcf of gas. The trend for the future has limited application to the liquid credit for flowing gas, but we do not rely on this factor and it is not material to our conclusion. The liquid credit we used for new gas-well gas is primarily based upon the questionnaire data which reflects the historical experience of condensate production. The figure we adopted is lower than the amount that could be justified by the latest statistics showing condensate production from the recent discoveries, especially those at greater depths. We believe that our allowance for liquid credit conservatively reflects the condensate derived from the flowing gas-well gas the costs of which we are attempting to verify.

The examiner's computation of the cost of old gas-well gas and our modification of his computation of course reflect the net differences in numerous other items previously discussed in our determination of a new gas-well gas price. A complete comparative summary follows.

	Cost in Cents per Mcf	
	Examiner	Commission
Exploration and Development Costs		
Dry Holes	1.07	1.42
Other Exploratory Costs	1.19	1.59
Allowance for Growth	.83	1.11
Production Operating Expense	2.88	2.70
Net Liquid Credit	(2.68)	(3.10)
Regulatory Expense	.14	.14
Depletion, Depreciation, and Amortization of Production Investment Costs		
Successful Well Costs	2.16	2.42
Lease Acquisition Costs	.57	.64
Cost of Other Production Facilities	.23	.26
Return on Production Investment (at 12%)	3.91	4.38
Return on Working Capital	.20	.35
Subtotal	10.50	11.91
Royalty at 12½%	1.60	1.83
Production Taxes[42]	.72	.90
Total	12.82	14.64

[42] Texas production taxes of 7 percent have been used in this computation. New Mexico taxes are lower, and both cost computations and the ceiling price should be reduced accordingly for gas produced in New Mexico. The amount of production taxes does not include taxes on the royalty payments which are chargeable to the royalty owner. The results however are identical to the alternative method summarized at page 89 in which royalty payments were computed as an integral part of the cost of service and the separate item for production taxes was somewhat higher because it included taxes chargeable to the royalty owner.

It is apparent that the results obtained by using the examiner's method, as adjusted in the light of the Commission's views on liquid credit, return and other items, conform very closely with the results obtained in the Commission's own historical cost computation.

THE PRICE OF FLOWING GAS

On the basis of an historical cost determination, as verified by the examiner's approach, we shall fix a ceiling price for flowing gas rounded off at 14.5 cents per Mcf at 14.65 psia for gas produced and sold in Texas. The ceiling price in Texas includes a 1.01 cent production tax, which we round off to 1.0 cent, leaving a rate less production taxes of 13.5 cents. For gas produced and sold in the three New Mexico counties, Chavez, Lea and Eddy, the ceiling price shall therefore be 13.5 cents per Mcf at 14.65 psia plus the applicable production taxes in effect as of the date of this opinion. In accordance with the earlier discussion, this ceiling price will apply to all casinghead gas, and residue derived therefrom, both old and new, as well as to old gas-well gas and residue gas derived therefrom.

PRICE ADJUSTMENTS TO REFLECT QUALITY DIFFERENTIALS

The importance of quality standards as an integral part of our ceiling price becomes readily apparent if it is recognized that gas is purchased for its energy. The

price of gas cannot be related to volume alone but must be related to units of energy free of impurities and sufficiently compressed to enter the pipeline if it is to serve as a mechanism to assure just and reasonable rates. The presiding examiner pointed up the importance of relating the quality of gas to its price as follows:

> * * * Lowering the quality of the gas is the same as raising its price. If the pipeline purchases gas of lesser quality than previously, bears the cost of additional processing to raise the gas to its former standard, and includes the added costs in its cost of service, the result is the same as if the prices charged for the gas by the producer were raised. A pricing system that fails to insure quality and value is a sieve. [p. 67]

Some of the respondents have urged that no specific price differentials be established to reflect variations in quality. They argue that buyer and seller, after a ceiling price is fixed, will establish lower prices for gas of below standard quality by bargaining.

If we accepted the producers' contention, the burden of securing lower prices to reflect lower quality gas would be on the pipeline, and the record does not support the producers' contention that through bargaining the parties would necessarily agree upon prices for gas with quality deficiencies which were below the ceilings imposed for pipeline quality gas. A large loophole for evasion of

ceiling prices would lie open; a producer receiving the ceiling price for inferior quality gas would be piercing the ceiling prices, insofar as the consuming public is concerned, just as much as if the producer were collecting

an above-ceiling price for pipeline quality gas or deliberately diluting the gas with inert material. In addition, gas now flowing under existing contracts would not be repriced, whatever bargains might be made for the future. Its price would be governed by the existing contract terms, limited only by the applicable area price ceilings. We think, therefore, that in this proceeding we must require the area ceiling prices for new gas-well gas as well as flowing gas to be adjusted for departures from the standards for gas of pipeline quality. We believe that the record in this case provides an ample basis for the quality guidelines we here establish.

A preliminary question is the basis upon which the quality adjustments should be applied. We think these price differences should be predicated upon differences in the quality of gas sold under particular contracts rather than upon an averaging process. Such an approach is fairer to the individual producers, and avoids the possibilities of manipulation which would be inherent in a price system which failed to reflect quality differences in particular transactions.

Quality Standards

The first step in establishing price variations corresponding to variations in the quality of gas is to determine the quality standards which must be met if gas is to command the ceiling price applicable to its particular category. There are several quality factors which require consideration in establishing prices in the Permian Basin and we shall discuss each of them separately.

Sulphur

Sulphur, hydrogen sulphide, and other sulphur compounds are the most prevalent impurities in gas in the Permian Basin. The problem is greater here than in any other area in the country. The generally accepted standard in the Permian Basin, which we here adopt is that gas

which contains more than 10 grains of hydrogen sulphide or 200 grains of total sulphur per Mcf is designated as "sour gas" and is not considered to be of pipeline quality.[43] Gas containing 10 or less grains of hydrogen sulphide and 200 or less grains of total sulphur is known as "sweet gas" and is considered to be of acceptable pipeline quality in this respect. These standards are not only generally accepted in the Permian Basin, but it does not

[43] Total sulphur shall be determined as provided in: "Test for Total Sulphur in Fuel Gases" ASTM Designation: D 1072-56, adopted 1956.

appear that any different standard with respect to sweet and sour gas is applied in other areas.[44]

Water

The record establishes that an accepted standard for pipeline quality gas in the Permian Basin is that the gas shall not contain in the aggregate more than 0.009 pound per Mcf of water, either in the form of liquid or vapor.[45] The prevailing national standard appears to be that gas should contain no more than 0.007 pound of water per Mcf of gas. Even more stringent standards appear in some of the contracts for sale of gas in the Permian Basin.

It may be argued that, since the national average cost has been used in arriving at the ceiling price for new gas-well gas fixed in this proceeding, the national standard for such gas should apply rather than an area standard. Until such time as this Commission has by rule established a different standard, we prefer to adhere to the accepted practices of the industry in the area and we shall consider gas in the Permian Basin containing not more than 0.009 pound of water per Mcf to be of pipeline quality.

---

[44] We are cognizant of the slightly more liberal definition of sweet gas used by the State of Texas.

[45] Water vapor content is to be determined as provided in: "Test for Water Vapor Content of Gaseous Fuels By Measurement of Dew-Point Temperature" ASTM Designation: D 1142-58, adopted 1953, revised 1958.

Carbon Dioxide

Carbon dioxide is found in excessive quantities, sometimes as much as half of total volume, in 2 to 3 percent of the gas produced in the Permian Basin. It is not combustible and so has no value as fuel. Under the present technology, it contributes nothing in the way of liquids and is valueless to the petrochemical industry. It is not merely a diluent which reduces the value of the gas in proportion to the extent that it is present; it combines with H_2O to form a comparatively mild acid which has a corrosive effect on pipelines. When present in large quantities, its removal is required before the remaining gas can be considered to be of standard pipeline quality, and extraction may be costly.

The evidence in the record indicates that where carbon dioxide is a problem in the Permian Basin, it comprises over 5 percent of the volume of the gas. However any amount of carbon dioxide reduces the value of the gas and we believe that the presence of more than 3 percent of useless diluent in the gas sold to a pipeline would require a reduction in the price. Accordingly, for the purpose of this proceeding, a standard for pipeline quality gas shall be that carbon dioxide shall not exceed 3 percent by volume.

Other Impurities

There was no testimony in the record with respect to impurities other than carbon dioxide, water, sulphur,

hydrogen sulphide, and other sulphur compounds. Some filed contracts contain clauses requiring the gas sold under them to be free of oxygen, dust, dirt, gums, and other substances. Precise standards cannot be established with respect to these impurities. The only standard which may fairly be applied, on the basis of this record, is that such impurities will be considered excessive to the point requiring a reduction in the price of the gas if they are present in sufficient amounts so that a pipeline incurs processing costs to remove them from the gas.

— 99 —

Btu Content

The record in this case reveals that in the past the level of Btu content (other than loss of Btu's resulting from excessive carbon dioxide content) has not been a substantial problem in the Permian Basin. Contracts for sales of gas in the Permian Basin generally contain clauses specifying that the Btu content of the gas sold shall not be less than a minimum, generally 1,000 Btu's, and little gas below that level (other than gas containing substantial amounts of carbon dioxide) has been sold in the Permian Basin. Any attempts to evade the ceiling prices for flowing gas imposed herein by reducing the Btu content of the gas below current standards in the area will come to our attention and many be dealt with as the occasion demands. Under these circumstances we see no need to establish any standard Btu

content for flowing gas in the Permian Basin so long as present conditions continue.

Looking to the future, however, we believe that it is important that we implement the general principle that Btu adjustment provisions "are in the public interest", advanced in our recent decision in Texaco, Inc., Opinion No. 464 (decided June 10, 1965). While Btu adjustments have not played a major role in the Permian Basin in the past we believe it important that our price for new gas-well gas reflect the energy content of the gas, which in reality is what the consumer is purchasing. We therefore believe it is necessary and appropriate to provide an upward adjustment for this premium quality feature of benefit to the consumers as well as to provide downward adjustments for deficiencies in quality for new gas-well gas. Such adjustments are to be used in computing the applicable price for new gas-well gas irrespective of whether the underlying contracts contain a Btu adjustment clause. However a producer will of course be limited by his contract if it is below the applicable ceiling as adjusted.

We believe the weighted average Btu content of gas-well gas in the area should generally be used as the guideline for upward adjustments. The weighted average Btu content for gas-well gas in the Permian Basin as shown in Exhibit 118 is 1,042 Btu's per cubic foot. That exhibit reflects the facts for over half of the gas-well gas in the area, and while the precise figure may be somewhat higher

or lower, the exhibit indicates that the weighted average is certainly well above 1,000 Btu's per cubic foot and does not exceed 1,050 Btu's. Accordingly, in computing the quality adjustments to the ceiling prices for new gas-well gas we shall permit an upward Btu price adjustment from a base of 1,050 Btu's per cubic foot on a proportional basis above the ceiling price fixed herein. The record also reveals that a minimum standard for pipeline quality gas in the Permian Basin is 1,000 Btu's per cubic foot. The 1,000 Btu minimum is not a national standard but is based on the evidence of the practice in the Permian Basin. We shall accordingly provide a downward adjustment for new gas-well gas from a base of 1,000 Btu's on a proportional basis from the ceiling price fixed herein.[46] The range of 1,000 to 1,050 Btu in which no adjustment will be required in the Permian Basin is not necessarily controlling for other areas where the record may well suggest a narrower range.

The Btu content of the gas to be used in determining price adjustments can be defined as the total heat value of the standard cubic foot as specified in Opinion No. 464. So that no producer will be penalized twice by the application of a reduction in rate for Btu deficiency in addition to a reduction required by the presence of carbon dioxide or other impurities, the Btu content should be measured after any necessary processing of the gas to remove impurities, as well as after removal of any liquids

[46] For example, new gas-well gas containing 1,155 Btu's will be allowed a 10 percent increase in rate, and new gas-well gas containing 950 Btu's will be subjected to a 5 percent reduction in rate.

for which the buyer pays separately, whether on a percentage basis or otherwise.

— 101 —

Pressure

The question of pressure is more complex. Gas cannot enter a pipeline unless it is under greater pressure than the pipeline pressure at the point of entry. Gas of lower pressure must be compressed to raise its pressure above that of the pipeline which it is entering. It is not the number of pounds by which a given quantity of gas may fall over pipeline pressure that is important, but the number of stages of compression through which the gas must be put in order to raise its pressure sufficiently. The majority of the main-line pipelines in the continental United States operate to maintain a pressure at the compression stations ranging from 800 pounds to 1,000 pounds per square inch (psi) or about 900 psi on the average. Evidence in this case of actual delivery pressures for producers in the Permian Basin indicates that pipeline purchasers in the Permian area have main-line operating pressures averaging about 800 psi. Thus we are presented with the question of whether a national pressure standard of some 900 psi should be adopted here or whether we should use the average pressure in the Permian Basin of about 800 psi.

It could be argued that where national average cost is used in establishing a ceiling price, the average national pressure should also be used in establishing the standards

to which gas priced at the ceiling must conform. However, the prices we fix here are area prices, and may be modified in other areas for factors other than cost. The adoption of a 900 pound pressure standard for the Permian Basin would require a price reduction on all Permian Basin residue gas and nearly all gas-well gas. While delivery of gas at higher pressure would confer some benefits on the pipeline (by reducing the amount of compression needed to move gas along the pipeline) it seems inequitable to penalize the producers and processors who deliver gas at the pressure for which the pipeline is designed and who in many cases could have delivered it at higher pressure if called upon to do so, without additional expense. The physical equipment in the Permian Basin is now largely geared to delivery at 800 pounds pressure. We shall therefore adopt an 800 pound pressure standard for the Permian Basin.

— 102 —

The Amount of Price Adjustment

In accordance with the foregoing, we set forth the following principles to govern price adjustments when a purchaser buys gas which deviates from the standards here established for gas of pipeline quality:

(1) The applicable ceiling price shall be adjusted downward by the net cost of processing the gas to bring it up to standard, by the amount of any applicable upward or downward Btu adjustment (for new gas-well gas only) and by the amount of any sav-

ing or additional expense to the seller from any reduction or increase in taxes or royalty payments resulting therefrom.

(2) If the processing is performed by the purchaser, a reasonable return upon the required investment should be included as a part of the processing cost incurred in bringing the gas up to pipeline quality.

(3) If processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

Procedure

In establishing a procedure for determining the amount of the reduction in the ceiling price applicable in the case of gas with quality deficiencies, our purpose is to impose the minimum regulatory controls required to carry out effectively our responsibilities to assure wholesale customers that the price they pay will be just and reasonable. Accordingly, sales by small producers that are covered by the proposed small producer certificate rule, shall be exempt from such adjustments on the *de minimis* principle, because the burden and expense involved would in most cases exceed the amount of the adjustments. Furthermore, the major producers, processors, and pipelines will be allowed in the first instance to establish among themselves, in accordance with the standards set forth here, the amounts by which ceiling prices should be adjusted in the case of each individual contract which deals with gas which deviates from the quality standards

herein established. If the parties reach agreement that no change from the ceiling price is required or that a specific price adjustment is required, a statement

of the agreed price for the gas shall be filed no later than 90 days from the effective date of this order. The producer as part of the statement shall itemize the amounts and nature of each of the quality adjustments and explain the basis therefor, and set forth the price agreed upon by the parties as representing the applicable ceiling price as adjusted.

If the parties are unable to agree upon any or all of the quality variations of the gas or the costs of remedying defects (except for sales by small producers exempt from these quality adjustments), the required statement must so indicate and the seller must supply the itemized information required to compute the applicable ceiling price as adjusted. The buyer will be given an opportunity to state its position and the Commission will then determine the applicable area rate. Pending such determination, the seller may collect a price not in excess of the unadjusted area ceiling price for the type of gas in question, subject to the obligation to make refund of any excess collected, from the effective date of this order, above the applicable area rate (the ceiling rate reduced by the cost of processing to correct quality deficiencies and, in the case of new gas-well gas, further adjusted for Btu variations) ultimately determined to be proper.

No pipeline will be entitled, as part of its cost of service, to any amounts paid for gas in excess of the applicable ceiling price as adjusted in accordance with the standards and principles set forth in this opinion. The acceptance for filing of any amendment or certificate, or the failure to suspend any rate so established, shall not prevent the application of this rule.

It is our expectation that this procedure will result in the parties determining the proper adjustments in price levels to reflect differences in the quality of gas sold. Should this objective not be realized and should the Commission be confronted with a large number of contests, or should it be found that evasion or abuse is prevalent, it may be necessary to take measures to fix the precise price variations corresponding to variations in gas quality.

— 104 —

PETITIONS FOR SPECIAL EXEMPTION FROM THE AREA RATES

We have already discussed *supra* at pages 11-19 why we believe that maximum area rates can and should be established as the just and reasonable rates applicable generally to the sales of natural gas in the Permian Basin. The question remains what procedure or procedures should be adopted for the benefit of those respondents who, by reason of special circumstances, believe they can demonstrate that they are entitled to variant treatment.

(277,670)

First, we should frame the limits of the problem. We are not here treating sales to be permanently certificated after the effective date of this decision. In the future it would normally not be in the public interest to certificate sales of gas (including gas flowing under temporary certificates) at initial prices above the applicable area rate. While we do not visualize any reason for certifying any new sales at prices above the just and reasonable ceiling price, any producer unwilling to accept a certificate at the appropriate ceiling will have an opportunity to show in the hearing on his certificate application the special circumstances which he believes warrant making an exception in his case in the public interest.

The problem for our immediate attention thus relates solely to gas presently being sold under outstanding certificates. Our decision herein has a double impact on the gas presently flowing in interstate commerce from producers in the Permian Basin. It fixes a price for the future, and it determines the basis for refunds for past periods. We shall first discuss the basis for permitting special exceptions to the area rate with respect to future rates for flowing gas and later discuss the question of relief from refund requirements.

277,671

— 105 —

It would seem clear that where a producer who has contracted for an above-ceiling price can show that his out-of-pocket expenses in connection with the operation of a particular well are greater than the revenues under

the applicable area price, he should be entitled to appropriate relief, and there may be other circumstances where a producer as a matter of law or in the public interest would be entitled to some relief.

We need not and cannot here specify all of the special circumstances which may serve as a basis for exceptions to the area rate. It is clear however that confiscation does not result merely because, as a result of high costs or low production, a given producer cannot, at the area price, recover his expenses for his unsuccessful exploration and development costs and earn the 12 percent overall return on producer investment rate base which we have adopted as the appropriate return to attract capital on an area-wide basis for gas exploration and development. We recognize that any amounts received by the producer for flowing gas above out-of-pocket expenses would be available to finance further exploration, but no producer has a constitutional right to a price for the future which will enable him to expand his venture in the interstate gas business and the inability to earn such allowances at the area ceiling cannot be characterized as confiscation. As the Court of Appeals for the District of Columbia recently observed, "the Commission is not required to subsidize high cost producers with consumers' money." *Atlantic Refining Co.* v. *F.P.C.*, 316 F.2d 677, 680 (CADC, 1963); see also *Callery Properties, Inc. et al.* v. *F.P.C.* 335 F.2d 1004 (CA5, 1964). The same rule certainly applies to the development of reserves which are held off the market for speculative purposes.

Even in situations where producers are able to show that they are entitled to relief from the obligation to con-

tinue to sell flowing gas at the appropriate area ceiling, in most cases it may be sufficient to permit them to abandon their unprofitable sales. Unlike the case of some public utilities which cannot abandon service without harming the public dependent thereon, we will seldom have a situation in which a particular producer's

abandonment of some or all of its sales in the area will significantly affect the purchasing pipeline, to say nothing of the ultimate gas consumer. There may, however, be some exceptional situations where abandonment could be shown to be detrimental to consumers, or where the producer could demonstrate that some other form of relief would best serve the interests of the public as well as his own.

The remaining confiscation question is with respect to refunds for past periods. On a composite basis the area ceiling prices for both flowing and new gas provide a reasonable allowance for exploration and development and production operating expenses in addition to a 12 percent return on the producing investment. As we stated earlier, a claim that it would be confiscatory to require the refund of amounts a producer has collected above the area rate cannot be supported by the fact that a particular producer in the past has chosen to spend more than a reasonable allowance in what proves to be unsuccessful or marginal exploratory efforts or by the fact that unit production costs are high because for speculative purposes

or other reasons the producer has withheld from production gas that he has discovered. On the other hand it seems clear that a producer should not be required to make refunds for past periods which would deprive him of amounts sufficient to cover his out-of-pocket operating expenses in the Permian Basin for such period. We need not consider other situations at this stage of the proceeding; it is sufficient to note that here too we will entertain petitions for special relief, and that the dockets involved will remain subject to the existing interest obligations pending their resolution.

We need not speculate further here as to the exact circumstances in which special relief may be warranted from the area price maximums for some or all of a producer's sales, or the appropriate nature of such relief. Any producer claiming that he is entitled to special relief from the maximum rate set for any of his Permian sales or from the refund obligations imposed herein may file a petition for such relief with the Commission consistent with the general guidelines set forth herein. Any such petition will be disposed of as promptly as possible.

Since the petitioner will bear the burden of showing that he is entitled to special relief the producer (unless authorization is granted for temporary abandonment) will not be relieved of his obligation to continue service at the appropriate just and reasonable rate pending the determination

of his petition. See *The New England Divisions* case, 261 U.S. 184, 198-199 (1923).

CHANGES IN THE AREA RATE

Our adoption here of a two-price vintaging system of fixing just and reasonable producer prices simplifies questions as to the appropriate or permissible methods for changing such prices. The two-price system enables us to provide a higher price for future discoveries if justified by changed circumstances. It is unlike the situation resulting from the utilization of a single price based upon historical costs, where significant changes in conditions may necessitate a change in the just and reasonable price for all gas. For example, an indication that new well drilling costs were increasing might (all other things being equal) demonstrate that a higher price should be set for gas certificated at some date in the future but would not necessarily show that the just and reasonable price we here prescribe for gas already flowing requires revision. Other changes unrelated to the continuing operations under which flowing gas is brought to market will be relevant only to the question of whether a new price should be set to govern future sales, thus permitting price stability for gas already dedicated to the interstate market.

This does not mean that the just and reasonable price for flowing gas can never vary. We have fixed the price of the pre-1961 gas-well gas and all other gas on the basis of the composite cost showing of gas-well gas for the Permian Basin in 1960. Of course if it could be shown that the average rates of take of such gas had

significantly dropped or that the continuing operating costs of the gas wells had increased significantly, it might well be that the maximum just and reasonable price for such gas should

be adjusted. This would also be true for the gas coming into the market since 1960, although the evidence of record indicates that costs have remained remarkably steady during the ensuing years and are likely to remain stable during the moratorium period prescribed herein. Essentially, under the type of pricing we are instituting, the cost of flowing gas-well gas and all casinghead gas and residue gas derived therefrom will tend to remain relatively constant and permit stable rates, even though changing circumstances might demonstrate the need for new and substantially different rates for gas-well gas coming on to the market at later periods.

In this framework, we approach the question of the appropriate mechanism for altering the area rates. We can, of course, in this proceeding fix the just and reasonable price only for gas flowing pursuant to outstanding certificates. We believe that a moratorium for new rate increase filings above the applicable area ceiling prices for a 2½ year period is essential if our decision herein is to achieve effective control over producer prices. In the absence of such a moratorium the producers would be free to file rate increases and continue to collect their producer prices even though they exceeded the just and

reasonable rates herein prescribed. Without a moratorium, the conclusion of one area proceeding would only signal the beginning of the next, and just and reasonable rates for consumers would always be one area proceeding away.

The Supreme Court recently noted the obvious inadequacies of the refund obligation as a protection of the public interest (*F.P.C.* v. *Tennessee Gas Transmission Co.*, 371 U.S. 145, 154, 155 (1962); *F.P.C.* v. *Hunt*, 376 U.S. 515, 524 (1964)). Without the moratorium we have provided the public interest could be protected only to the extent that the Commission could devise procedures to enable it to complete an area proceeding within the 5-month suspension period or shortly thereafter. See *F.P.C.* v. *Tennessee Gas Transmission Co., supra;* cf. *Panhandle Eastern Pipe Line Co.* v. *F.P.C.*, 236 F. 2d 606 (CA3 1956).

277,675

— 109 —

While the Supreme Court's description of a Section 5 producer rate proceeding in the *Catco* case as "well nigh interminable" is, we hope, no longer apt, the more than four-year history of this case, conducted with acute awareness of the running of time, demonstrates that we are dealing with inherently time-consuming proceedings. We expect to complete future area cases in much less time, but we would be unrealistic in the extreme to assume that any rate proceeding could be completed in less than several times the length of the 5-month suspension period. Without the limited moratorium on rate

filings prescribed by our order herein this mammoth proceeding would fix prices for only a 5-month period and the producers could then overturn the Commission's order by a series of new filings to reinstate their pre-existing rates.

It is our view that the filing of rate increases by a natural gas company pursuant to Sections (d) and (e) can be limited either by private contract or as a result of the reasonable exercise of this Commission's authority under Sections 5, 7 and 16 of the Act. Certainly, it would be an anomalous situation if the filing of rate increases could be restricted by private bargaining but not by reasonable exercise of regulatory authority in the public interest. We have exercised such authority in this initial proceeding fixing rates on a group basis under the Natural Gas Act because it is an essential feature of the area approach if it is to achieve effective control over producer prices for the protection of consumers. We believe the 2½ year period is the minimum time required to afford price stability that will be beneficial to consumers and the industry as well. Considering the evidence of stable costs, and the provisions for earlier relief, if warranted, this limited moratorium is not unfair to producers.

The producers nevertheless contend that pursuant to the provisions of Section 4(d) of the Act, a natural gas company has a right to file any contractually authorized rate increase even if the Commission has just held that the maximum just and reasonable price for such sale is of a lesser amount. They argue that the only procedure available

to the Commission is to enter into the suspension and hearing procedure established by Section 4(d), with the company having the right to put the increase into effect subject to refund at the end of the maximum statutory five months' suspension period.

We do not believe that the Commission's powers are so limited that its regulatory efforts must be futile where after a long and full hearing we have determined the just and reasonable rates to be set for the future. The *Mobile* case (*United Gas Pipe Line Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332, 339 (1956)) made clear that:

> * * * § 4(d) is simply a prohibition, not a grant of power. It does not purport to say what is effective to change a contract, any more than § 4(c) purports to define what constitutes a "contract" that may be filed with the Commission. The section says only that a change *cannot* be made without the proper notice to the Commission; it does not say under what circumstances a change *can* be made * * * [emphasis in original]

It is true that despite the Court's explanation of the meaning of Section 4(d) as simply a prohibition on filings, and not a grant of power, the opinions of the Court in *Mobile* and in the subsequent *Memphis* case (*United Gas Pipe Line Co.* v. *Memphis Light, Gas & Water Division*, 358 U.S. 103 (1958)), contain dicta to the effect that a pipeline can file for such increases as

are contractually authorized and after the suspension period, put them into effect subject to refund. See also *Atlantic Refining Co.* v. *Public Service Commission of New York* (CATCO), 360 U.S. 378 (1959). These dicta must be read in context of the issue raised in the cases, which was the effect of restrictions on increased rate filings by pipelines stemming from contractual limitations by the parties in circumstances where the pre-existing rate had not been fixed by the Commission pursuant to its authority to prescribe just and reasonable rates for the future. These cases dealt with regulation on an individual company basis in which there is a long administrative

history of permitting increased rate filings and where the Commission as a matter of policy has never written a moratorium into a rate order. They are entirely consistent with our recent order in *United Gas Pipeline Co.*, RP65-1, ... F.P.C. ....., issued October 22, 1964, where in refusing to reject an increased rate filed by a pipeline we made clear that "the Commission is [not] completely without discretion to impose by rule or by order a reasonable moratorium on the filing of rate increases under Section 4(d) of the Act in circumstances where the orderly administration of the Natural Gas Act makes such conditions necessary."

The authority we assert herein is neither novel nor unique as applied to group rates set after full agency hearing. The ICC operating under a statute containing

(277,677)

language virtually identical to Section 4 of the Natural Gas Act long ago stated that "to say that the Commission's order may be defeated merely by publication and filing of a rate higher than that prescribed by the order is to say also that the shipping public is not entitled to the protection of this Commission's orders during the period they are in force * * * *." (*City of Springfield, Tenn.* v. *Louisville N.R. Co.*, 53 ICC 603, 605, 606 (1919); see *Fifteen Per Cent Case*, 45 ICC 303 (1917).) The CAB has similarly held that a group rate fixed by the Board could only be modified by subsequent Board action and not by a carrier's unilateral filing. *Minimum Rates Applicable to Air Freight* Order No. E-17370, 34 CAB 263 (1961).

The Supreme Court has expressly held in *United States* v. *Corrick*, 298 U.S. 435, 439, 440 (1936), that where the Secretary of Agriculture under the provisions of Section 310 of the Packers & Stockyards Act (7 U.S.C. § 211 (1921)) prescribes "the just and reasonable rate or charge, * * * to be thereafter observed" such rates "become the only lawful rates and so remain until further order of the Secretary" and cannot be altered by the unilateral action of a particular marketing agency pursuant to provisions of Section 306 of the Packers & Stockyards Act (7 U.S.C. § 207). That section is virtually identical with Section 4 of the Natural Gas Act.

277,678

— 112 —

It cannot be argued that the ICC and Packers & Stockyards Acts precedents are not in point because those acts

expressly provide that orders fixing just and reasonable rates "shall continue in force until [the agency's] further order". (see Interstate Commerce Act, § 15(2), 49 U.S.C. § 15(2); (1887); Packers & Stockyards Act, § 313, 7 U.S.C. § 214). The ICC adopted the position noted above before the language in question was introduced into its Act in 1920[47] and the Supreme Court in *Corrick* supported its conclusion not by reference to the different language of Section 313, but by the quoted language of Section 310 which parallels Section 5(a) of the Natural Gas Act and by citing its earlier decision in *Arizona Grocery Co.* v. *Atchison T.&S.F. Ry. Co.*, 284 U.S. 370 (1932), standing for the general proposition that where the agency "declares a specific rate to be the reasonable and lawful rate for the future, it speaks as the legislature and its pronouncement has the force of a statute" (284 U.S. at p. 386).

The absence in the Natural Gas Act of language similar to that found in Section 15(2) of the Interstate Commerce Act and Section 313 of the Packers & Stockyard Act, means only that Commission orders under Section 5(a) do not automatically have the effect of tolling the availability of Section 4 filings (see *United Gas Pipe Line Co., supra*). It leaves the Commission free to exercise its express authority to "fix" by order "the just and reasonable . . . rule, regulation, practice or contract to be thereafter observed and in force" (Section 5(a)) and to "perform any and all acts and to prescribe . . . such

[47] Cf. Section 3 of the Hepburn Act of 1906 (34 Stat. 589) with Section 418 of the Transportation Act of 1920 (41 Stat. 484).

orders, rules and regulations as it may find necessary or appropriate to carry out the provisions of this act" (Section 16); See *Public Service Commission of New York* v. *F.P.C.*, 327 F. 2d 893, 896-897, (CADC, 1964).

277,679

— 113 —

The Commission under Sections 5(a) and 16 of the Natural Gas Act may impose a reasonable moratorium on increased rate filings under Section 4 which are inconsistent with the just and reasonable rates found after hearing, and require that during this period the just and reasonable rates be changed, if at all, solely by modification of its original decision after appropriate proceedings held in that docket. The orderly administration of the Natural Gas Act necessitates that we exercise such authority in fixing the rates for sales by gas producers on an area basis.

It will therefore be our policy to certificate new sales of gas in the future at initial prices no higher than the just and reasonable price for new gas, and upon condition that no increased rate higher than the ceiling price be filed before January 1, 1968 (a 2½-year period which we believe to be the reasonable duration for a moratorium on filings for rates higher than the ceiling prices fixed on the basis of this record), unless within such time, either upon the Commission's own motion or upon an adequately supported petition by some interested party, the Commission at its discretion decides to reopen this proceeding to consider whether a different rate or

rates should be adopted for sales certificated at subsequent periods. We expect that the just and reasonable rate for new gas would constitute the maximum price at which new gas would be initially certified, the so-called "in-line" price, until the just and reasonable rate is changed by the Commission.

As to existing sales, whether they fall within the categories to which the flowing gas or new gas-well gas rates are applicable, we shall, pursuant to our authority under Sections 5 and 16 of the Act, similarly provide against any filing of rate increases above the applicable ceiling price fixed herein before January 1, 1968, but will permit any interested party within such period to file a petition directed to the Commission's discretion, showing why it believes the proceedings should be reopened to consider earlier changes. The Commission reserves the right to reopen the proceeding in its discretion to permit earlier changes in rates in the event of drastically changed circumstances. In any event after the 2½-year period, we shall also permit contractually authorized rate increase filings to be made pursuant to Section 4 for all sales in the area.

MINIMUM RATES

The examiner found that certain contracts in the Permian Basin were "below the revenue standards" he adopted. While the record is not clear on this point many of these contracts presumably were negotiated at a time

CARD 22

when natural gas was a by-product of the search for oil and the interstate markets had not yet developed.

To aid in rectifying the situations where producers had contractually precluded themselves from obtaining an increase in price of their gas, the examiner authorized the seller, with the consent of his buyer, to increase his rates up to the minimum established in the decision; to wit, 9 cents per Mcf of gas-well gas and 7 cents per Mcf for casinghead gas.

277,681

— 115 —

The Supreme Court in *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1956),[48] recognized that this Commission possesses the power to authorize rate increases despite contractual limitations to the contrary. However, the Court was careful to point out that such an order required as a foundation more than the mere fact that, because of an improvident bargain, a utility was receiving less than a fair price for its product. The Court said (at p. 355): "In such circumstances the sole concern of the Commission would seem to be whether the rate is so low as to adversely affect the public interest — as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory."

[48] Though this case involved the Federal Power Act, the Court noted that: "The pertinent provisions of the Federal Power Act, * * * are §§ 205(c), (d), and (e), and 206(a), which are substantially identical to §§ 4(c), (d), and (e), and 5(a), respectively, of the Natural Gas Act." (at pp. 350-351)

It is thus clear that the test of whether rates should be increased is not one of private equities but of the public interest. It is also clear that the examples set forth by the Court are not, and were not intended to be, the only instances where public interest would justify an authorization to increase rates in contravention of a contract. In addition it should be noted that the *Sierra* case was decided in the context of an individual company rather than an area rate approach.

We concur with the examiner in his conclusion that the establishment of minimum rates in this case is in the public interest and that the price impact on the consumer will be *de minimis*. While on the other hand, the establishment of a maximum price for the area is essential so that the ultimate consumer does not pay a price which is excessive in relation to group costs and other relevant considerations, we believe that a minimum price also

constitutes an integral part of the area rate approach. The rate received by a producer must not be so low as to prevent or retard further exploration and thereby decrease possible discovery of gas reserves which will be needed by consumers. The amount of additional revenue so provided, at the most $250,000 annually, will have no significant impact on consumers but the relief afforded the individual producers involved may be important to their continuation in the search for additional gas sup-

plies needed to meet the growing needs of the consuming markets.

Although we have agreed with the examiner's conclusion as to the need for a minimum rate, we believe that his remedy, which would not allow the producer with sub-minimum rates to raise them to the minimum unless he secured the approval of his purchaser, is not sufficient. Renegotiation of contracts resulting in increased rates which do not exceed the area rate would be proper without any action by this Commission, so that the examiner's remedy would avail nothing.

We therefore deem it necessary and appropriate to establish a minimum rate in this area of 9 cents per Mcf for gas of standard pipeline quality, with adjustments from the minimum price to reflect any deviations from the quality standards established herein, and to hold that the minimum rate herein established may be filed without purchaser approval at any time after this order becomes final.

REFUNDS

We shall require appropriate refunds in the case of rates which are the subject of proceedings under Section 4(e) of the Act, and have thus been collected subject to an obligation to refund amounts collected in excess of the just and reasonable rates as here determined. In each case the proper rate level for computing refunds shall be the area rate applicable to the particular category of gas involved, as adjusted by reason of any quality deviations in the particular gas.

The presiding examiner proposed that the total refunds to be made with respect to contracts for the sale of gas-well gas should be computed for each separate year on the basis of whether the industry as a whole had collected an excessive amount for gas-well gas in that year. Under this proposal, if one producer collected revenues from the sale of gas-well gas in excess of his proper prices, he would be required to refund such excess amounts only if it were shown that the industry as a whole in that year had received revenues from gas-well gas in the area in excess of the proper revenues for such gas. The same principle would be applied with respect to residue gas and to casinghead gas. Further, any deficiency in any year in overall industry revenues from any one of the three categories — gas-well gas, residue gas, or casinghead gas — would be used to offset excessive revenues collected for any other category of gas.

The underlying theory of the presiding examiner's approach is that refunds should be ordered only to the extent that overall industry revenues exceed overall industry expenditures in a given year. The briefs on exceptions indicate that many of the parties are not clear as to how this theory might be applied in particular cases.

Several fundamental objections preclude adoption of the examiner's proposed method of computing refunds. We think it would result in inequities among wholesale customers as well as among individual producers. If one

wholesale customer has been overcharged it is of little comfort to him to know that another customer has received a bargain. Conversely, if one producer has collected excessive amounts, he should not be relieved of his responsibility to return the excess by reason of the fact that some other producer collected too little. Furthermore, the administrative difficulties involved in attempting for each year, and each category of sales, to equate industry revenues with industry expenditures, and to allocate the excess revenues among the purchasers, seem almost insurmountable.

277,684

— 118 —

We have established just and reasonable ceiling prices for the Permian area, with adjustments from the ceiling prices in the case of gas which deviates from the quality standards we have established. The applicable ceiling price, including any quality adjustments, is the proper price for gas sold under a particular contract. We think it is proper and equitable to require refunds of amounts collected in excess of the ceiling price for gas sold under each contract. This has been our practice in prior proceedings under the Natural Gas Act, and on this record we see no reason, legal or equitable, to fail to return to the wholesale customers the excess sums they have paid. To the extent that any producer receives a lesser amount than our ceilings permit it is because he has agreed to prices which yield that amount or failed to file for a higher rate.

Refunds will be required only with respect to the rates which are the subject of Section 4(e) proceedings, and only for the periods during which such rates have been collected subject to refund.

A refund procedure must be established. We have determined that price adjustments corresponding to departures from standards shall be left to the parties for initial determination, if they are able to agree. The price applicable to particular gas cannot be finally determined until the parties have determined the quality of gas and the computed corresponding price adjustments. Accordingly, each producer (except small producers, who will be considered below) shall file a computation of refunds due with respect to each rate schedule within 30 days from the date of the filing of an agreement with his purchaser as to the quality of the gas sold and the cost per Mcf of processing such gas to pipeline quality standards. If no such agreement is reached the refund computation is to be filed within 30 days from the date of Commission determination of the quality adjustments. (See pp. 102-103 hereof for procedure).

In the case of Section 4(e) proceedings, the refund computation shall also be made for all periods during which rates were collected subject to refund. With regard to each rate schedule, such computation shall specify the applicable rate or rates as established in accordance with the principles set forth in this opinion (including

any adjustments for quality as prescribed herein), the rate or rates collected during the period subject to refund, the period during which any rate was collected in excess of the proper applicable rate, the volume of gas for which such excess rate was collected, and the amount of refunds due. Interest on such refunds (at the prevailing rate) shall be included in the computation.

Each producer will be directed to retain the refunds to be made by him until further order of the Commission. Such retention shall be in accordance with the option principle established by the Commission in *Humble Oil and Refining Company*, 32 FPC 49, Docket Nos. G-9287, *et al.*, issued July 8, 1964.

The rates for small producer sales as defined in the rule providing for small producer certificates for such sales proposed this date are not required to reflect any quality adjustments either for past periods or for the future. Small producer refund obligations will therefore extend only to refunding amounts

collected subject to refund in excess of the amounts collectible under the base ceiling rates. If a small producer wishes to take advantage of any permitted upward adjustment for new gas-well gas of high Btu content, he will be required to indicate also any offsetting deficiencies in quality of the gas in question by filing the same statements required of large producers.

SMALL PRODUCER PROBLEM

There have been many suggestions, foremost of which are those by Justice Clark dissenting in *Wisconsin* v. *F.P.C.*, 373 U.S. 294, 329-30 (1963), and speaking for the Court in *F.P.C.* v. *Hunt*, 376 U.S. 515 (1964), to the effect that this Commission should consider procedures for the exemption of small producers from regulation. There are many compelling arguments to justify distinctive treatment of small producers. The justification goes beyond the obvious benefits of relieving the small producer of the expense and burden of the regulatory process. Among other considerations, expediting the administrative process and facilitating effective regulation are suggested as additional benefits.

The examiner has set forth a well documented argument for recognizing the special problems of the small producer and affording him separate regulatory treatment. At the very heart of his analysis are two basic propositions which serve to distinguish the small producer from the large. The first is simply a recognition of the characteristic of "smallness," which as the examiner has said means that the typical small producer has limited operations and is thus subject to a greater degree of risk than is a large producer.

The examiner's second proposition is that the small producers, although numerous, account for a relatively small share of the natural gas produced in this country, and that

even without regulation they usually cannot obtain more for their gas than the regulated price we fix for the major producers. In the nation there are over 2,000 small producers as defined by the examiner, *i.e.*, those selling less than 10 million Mcf of gas per year, filing rate schedules with this Commission. They provide only about 15 percent of the total supply of natural gas moving in interstate commerce. The examiner concludes that the exclusion of the small producer from direct price control would thus have a *de minimis* impact on the consumer while the effect on the small producer would be highly beneficial. His procedural device for according exemption was a blanket finding that all the rates of the small producers were just and reasonable.

We agree with the examiner in general that special treatment of the small producer group offers scope for streamlining the regulatory process without the risk of substantial impact on consumer prices. Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators, who contribute a large share of the discoveries of new sources of gas. Easing the burdens of regulation would help to assure their continued participation in the gas production business.

While we are convinced that there is need for distinctive treatment for small producers, which we shall provide herein, we do not believe it is necessary or desirable

to provide outright exemption. We reach this conclusion assuming that exemption is legally permissible despite the mandatory language of Sections 4 and 7 of the Natural Gas Act.[49]

277,688

— 122 —

In our opinion the salutary objectives of those who propose exemption can better be achieved within the framework of regulation. Furthermore, any exemption for small producers would be more an illusion than a reality. As the small producers suggest, the area ceilings we prescribe will tend to set the maximum prices they can obtain for their gas.

A basic consideration in reaching our conclusion in this matter is that the impact of small producer prices on consumers is by no means *de minimis* on an area basis, and is of great impact in some situations. Sales by small producers constitute 80 percent of the gas supply of one pipeline[50] and range from 9 percent to about 60 percent

---

[49] Section 4(a) states in part that "*all* rates and charges" by "any natural gas company shall be just and reasonable." In Section 4(c) it is stated that "Under such rules and regulations as the Commission may prescribe, *every* natural gas company shall file * * * in such form as the Commission may designate, * * * *all* rates and charges * * *."

Section 7(c) provides in part that "No natural-gas company * * * shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission * * * unless there is in force with respect to such natural gas company a certificate of public convenience and necessity * * *."

[50] Kansas-Colorado Utilities Company, see F.P.C. Form 2.

of the supply of the other 25 largest pipelines. While small producers represent only 15 percent of the aggregate interstate gas supply it is obvious they are a substantial factor in the cost of the gas supply of millions of American consumers.

Another consideration which weighs with us is that penetration of rate ceilings, even on a small scale, could be seriously disruptive of a pattern of uniform area ceilings.

The examiner suggested relief for small producers from present filing requirements in the following manner: (1) a general certificate would issue to those natural gas companies which meet the qualifications of a "small producer", and (2) such producers would be required to file annual statements containing information as to their jurisdictional sales. The small producers in this proceeding support these suggestions.

We are interested in affording real relief to the small producers and in providing meaningful measures to clear our dockets and facilitate effective regulation. We recognize the burdens to small producers of complying with the filing requirements promulgated pursuant to Section 7 of the Natural Gas Act before new gas supplies can be connected. Such filings, which are routinely handled by the larger companies can, in the case of a small producer, strain his resources. The time lag, even the few weeks required under our expedited procedures, can deprive a

small producer of badly needed income. In light of these circumstances the Commission finds that it is necessary and appropriate to afford the small producers relief as provided below and we are issuing a notice of proposed rulemaking, this date, to implement our conclusions.

A small producer is thereby defined to be a natural gas company selling jurisdictionally less than 10,000,000 Mcf annually on a nationwide basis. Such a classification will include almost 250 of the filing producers in the Permian Basin and leave about 40 major companies subject to the filing requirements of Section 7 for individual sales. Nationally this breaking point would classify approximately 2,000 producers as small and about 75 as major companies. We believe that the record amply supports this reasonable classification made pursuant to Section 16 of the Act. For this purpose, the combined jurisdictional sales of affiliated companies (as further defined in the rule issued this date) will be considered as the sales of a single producer.

Companies or individuals in the Permian Basin qualifying as small producers will be granted small producer certificates pursuant to Section 7 of the Act authorizing all future small producer sales (as defined therein) in the area at or below the applicable area ceiling rate, thereby eliminating the need to obtain separate certificates for each sale as is presently required. This action will not only relieve the producers and the Commission of a large paperwork problem, it will enable small producers to bring their gas to market without any regulatory delay.

277,690

— 124 —

Sales in areas other than the Permian Basin by small producers will not be eligible for coverage by such certificates until an area rate is fixed therein because the determination of a specific area rate is a prerequisite for the issuance of such certificates.

All producers in the Permian Basin who apply and qualify as small producers under our proposed rule issued this date will be granted special certificates as to their Permian sales which will cover not only any future small producer sales (as defined therein) made within our area ceiling prices, but also all such sales for which a separate certificate has already been issued. Naturally, these certificates will be subject to the limit of 10,000,000 Mcf of annual jurisdictional sales on a nationwide basis and to area rate limitations. Those certificate applications within the ceiling pending before the Commission by small producers in the Permian Basin that come within the proposed rule will be covered within small producer certificates and any applications for certificates above ceiling will be granted conditionally upon acceptance of an initial price no higher than the ceiling.

277,691

— 125 —

Recipients of the small producer certificates will be required only to file annually a simple one-page statement in which they will state the total volume of jurisdictional

sales and certify that all such sales were within the applicable area ceiling. The producers holding such certificates will no longer be compelled to file Forms 301-A or 301-B,[51] nor will they be required to file individual initial rate schedules pursuant to Section 4(c) of the Act for the small producer sales. Furthermore, in light of our decision to accept all rate increases up to the area rate, holders of small producer certificates will not hereafter be required, under Section 4(d) of the Act, to file such changes for their small producer sales as they are made. Section 4(d) requires such filings "Unless the Commission otherwise orders * * *." We believe that inclusion of information pertaining to these changes, in the annual reports of the pipeline purchasers, will satisfy not only the language but also the purpose of Section 4(d). Of course, no increases above the applicable area ceiling will be permitted without the approval of the Commission pursuant to the filing requirements of Section 4(d).

Should a producer cease to be a small producer by virtue of an increase of jurisdictional sales to a level in excess of 10,000,000 Mcf in a year, or should he propose to sell at prices above the area rate, or should he make sales which do not qualify as small producer sales he must abide by the present requirements, *i.e.*, his certificate will not apply to such situations. Specific details of the small producer relief are explained in the Notice of Proposed Rulemaking issued this date.

---

[51] Presently required by the Regulations under the Natural Gas Act, Sections 260.5 and 260.6.

MISCELLANEOUS ISSUES

Favored-Nation and Spiral Escalation Clauses

The Presiding Examiner stated:

> . . . Most favored nations clauses and spiral escalation clauses cause price increases in a contract price to occur without reference to the circumstances or economics of the particular operation, but solely because of what happens under another contract. These clauses contravene the public interest and the basis on which prices have been determined in this decision. They are therefore declared to be inoperative and of no legal effect. No change in a rate resulting from such indeterminate pricing provisions will be permitted to take effect under this decision and order. (Initial Decision, p. 74)

The examiner correctly observed that most favored-nation clauses and spiral escalation clauses are not in accordance with the principles upon which a rate structure should be based. We have proscribed the filing of contracts containing such clauses executed on or after April 2, 1962. (Order No. 242, 27 FPC 339; *F.P.C.* v. *Texaco,* 377 U.S. 33.) We do not think, however, that such clauses in contracts already accepted for filing at the time of our order outlawing such clauses for the future should be denied effect insofar as they serve to permit filings up to the applicable area prices prescribed herein. When the contracts containing such clauses were negotiated such

clauses were a part of the bargain arrived at between the parties. Had they been proscribed at that time, escalation clauses of permissible types might well have been substituted. In any event there is no reason in the public interest to prevent rate adjustments which will permit producers to collect a just and reasonable price for their gas. These indefinite escalation clauses will, of course, like all other escalation clauses, be subject to the moratorium provisions discussed *supra* at pages 107-114 and, as the examiner ruled, such clauses will not be permitted to authorize rate filings above the applicable area rates subsequent to the expiration of the moratorium period.

Application of the Order

This proceeding, instituted under Section 5(a) of the Natural Gas Act, will determine the just and reasonable rates to be hereafter observed and in force for all jurisdictional sales being made under respondents' rate schedules. Such rates will apply as ceilings to all sales of respondents whether they were being made at the time we instituted this proceeding or were begun subsequent thereto. Certain of the respondents argue that our order cannot apply to rates established in contracts filed by such respondents after this proceeding was instituted. The argument has no merit. The evidence in this proceeding is based on a composite showing of the overall production in the area and fixes an area rate specifically designed to be just and reasonable for all jurisdictional sales in the area.

To hold otherwise would require an unending succession of Section 5 area rate proceedings, each covering only the sales instituted prior to the institution of the proceeding. We are not required to engage in any such massive duplication of effort. This proceeding was instituted to determine the just and reasonable rate or rates for the sales of natural gas produced in the Permian Basin subject to the jurisdiction of the Commission (Ordering Paragraph "A" of Order Instituting Hearing, 24 FPC 1121 (1960)). Consistent with the provisions of Section 5(a) of the Act, our Order will apply to all of respondents' sales in the described area. (See *United Gas Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332, 341 (1956)).

A few certificates have been issued since the institution of this proceeding authorizing sales in the Permian area by persons not respondents in this proceeding. Our Order here will not apply to these sales, but the parties making such sales will by separate order be directed to show cause why the area rates should not be applied to them.

Finally, with respect to certain of respondents' sales, increased rates have been filed subsequent to the institution of this proceeding and the dockets involving such increased rates (collected subject to refund) have not been consolidated herein. The above-stated reasons why our determination should apply to newly certificated sales is equally applicable to these nonconsolidated increased rate filings and the record in this proceeding would appear to

be adequate to determine the rates to be hereafter collected for these sales and to determine refund obligations. However, the dockets involving the increased rates were not consolidated herein and the respondents have not been afforded a hearing respecting their refund obligations. Accordingly, we shall not order refunds in these dockets but instead institute a separate proceeding requiring respondents to show cause why the rates here determined should not be utilized in determining their refund obligations.

Examiner's Witness Frazier

Continental (Brief on Exceptions, p. 78) on behalf of the Major Producer Group contends that the presiding examiner improperly called as his own witness Charles H. Frazier, then Director of Development for the Philadelphia Gas Works Division of The United Gas Improvement Company, and that he used Mr. Frazier's testimony as the basis for the dual pricing system, his pricing and location differentials, and rate design. The Major Producer Group argues that the burden of proof is the Commission's and that in the Section 5 part of the proceeding, it is well-settled that the commingling of the investigatory and adjudicatory phases of an administrative proceeding violates due process of law and the specific requirements of the Administrative Procedure Act. They note that Section 1.30(f) of our Rules, like Section 5 of the Administrative Procedure Act, provides that one engaged in the investigatory phase must not participate in the decisional process.

It should first be observed that neither Section 5(c) of the Administrative Procedure Act nor Section 1.30(f)

of our Rules by its terms applies in rate proceedings. Thus, even if it were assumed that the examiner in calling his own witness was acting in an "investigative" role, he

did not violate either the Act or the Rules. More important, however, the examiner's action was not "investigative" but a proper function of the trial examiner in a hearing. Both the Senate and House Committee Reports on the Administrative Procedure Act expressly point out that hearing officers "have the authority and duty — as a court does — to make sure that all necessary evidence is adduced."[52] The Act confers authority for what the examiner has done (see Section 7, *passim*). We also note that the state courts have approved the action of a judge in calling his own witness. *Ramsey* v. *Mading*, 217 Fac. 2d 1041 (Wash. S. Ct.); *Hunt* v. *State*, 248 Ala. 217, 27 So. 2d 186, 193; and *People* v. *Rotello*, 329 Ill. 448, 171 N.W. 540, 542. See also 9 Wigmore, Evidence 267-270; 3 Wigmore, Evidence 151-153; 4 Jones, Evidence 1685.

It is suggested that Witness Frazier may have had an interest in the proceeding because his employer, a gas distributor, though not a party in this proceeding, is an intervener in other area proceedings. This point, however, only goes to the weight to be given his testimony,

[52] Sen. Doc. No. 248, 79th Cong., 2d Sess., page 207. See also House report at page 268.

not its admissibility. If interest in the proceeding were a disqualification most of the evidence in this case would be stricken. See 4 Jones, Evidence, 1865-1966.

Witness Frazier's background and employment status were well known at the time he was called and are a matter of record. Respondents were given a full opportunity to cross-examine Frazier and to bring out anything which would impeach him either by way of challenge to his qualifications as an expert witness or challenge to his views because of his interest. His testimony, of course, is entitled to no more credence because he was called by the examiner rather than by a party. We conclude that the calling of Witness Frazier was proper and has not been shown to have resulted in any prejudice to respondents.

— 130 —

The Commission further finds:

(1) Each of the respondents listed in Parts I and III of Appendix A to this opinion is, and at the time of all past sales with which we are here concerned was, a natural gas company within the meaning of the Natural Gas Act and is engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption, subject to the jurisdiction of this Commission.

(2) Past, present, and proposed sales of natural gas to which the order herein applies are subject to the jurisdiction of this Commission.

(3) Rates for all sales of natural gas, by the producers in Texas Railroad Districts 7-C and 8 and New Mexico counties Lea, Eddy and Chavez which are respondents herein, that are above the applicable area rates prescribed herein, have not been shown to be just and reasonable or otherwise lawful under the provisions of the Natural Gas Act and should be disallowed, and refunds should be required as hereafter provided.

(4) The just and reasonable rates for past, present and proposed sales of natural gas to which this order applies are the applicable area rates set forth in ordering paragraphs (A) and (B) below.

(5) It is necessary and appropriate and in the public interest to establish minimum rates as provided in ordering paragraph (G) for all natural gas produced in the Permian Basin.

(6) Contracts providing for rates in excess of the applicable just and reasonable rates determined herein or below the minimum rates herein established are in that respect unjust and unreasonable.

(7) The moratorium until January 1, 1968, upon the filing of price increases above the just and reasonable rates established herein is necessary to the practical administration of area rate ceilings and the effective price regulation of natural gas producers.

(8) Except as herein granted the exceptions to the initial decision and proposed order should be denied.

The Commission orders, pursuant to Sections (4e) and (5a) of the Natural Gas Act

(A) *The Base Area Rates*

The following base area rates are hereby established, as of the effective date hereinafter defined, as the just and reasonable rates for sales of gas for resale in interstate commerce by the respondents in this proceeding, subject to any applicable adjustments for quality as provided in ordering paragraph (B) hereof:

(1) For new gas-well gas, as defined in this opinion, sold and to be sold pursuant to contracts executed on or after January 1, 1961, and any residue gas derived therefrom:

a. In Texas Railroad Districts No. 7-c and 8 — *16.5 cents per Mcf* (at 14.65 psia).

b. In Lea, Eddy and Chaves Counties in New Mexico — *15.5 cents per Mcf* (at 14.65 psia) plus the applicable state and local production taxes in effect on the effective date hereinafter defined.

(2) For gas-well gas, sold and to be sold pursuant to contracts executed before January 1, 1961, and any residue gas derived therefrom, and for all casinghead gas and any residue gas derived therefrom sold and to be sold:

a. In Texas Railroad Districts No. 7-c and 8—*14.5 cents per Mcf* (at 14.65 psia).

b. In Lea, Eddy and Chaves Counties in New Mexico—*13.5 cents per Mcf* (at 14.65 psia) plus the applicable state and local production taxes in effect on the effective date hereinafter defined.

277,698

— 132 —

(B) *Quality Standards and Adjustments to the Base Area Rates*

(1) The base area rates fixed in ordering paragraph (A) herein shall be adjusted for any deviations from the standards for pipeline quality gas in Texas Railroad Districts Nos. 7-c and 8, and in the New Mexico counties of Lea, Eddy and Chaves, which are hereby established as follows:

a. *Carbon Dioxide:* Pipeline quality gas shall contain not more than 3 percent carbon dioxide by volume.

b. *Hydrogen Sulphide:* Pipeline quality gas shall contain not more than 10 grains of hydrogen sulphide per Mcf of natural gas at 14.73 psia and 60° F.

c. *Total Sulphur:* Pipeline quality gas shall contain not more than 200 grains of total sulphur per Mcf of natural gas at 14.73 psia and 60° F.

d. *H_2O:* Pipeline quality gas shall contain not more than .009 pound of H_2O per Mcf of natural gas at 14.73 psia.

e. *Other Impurities:* Pipeline quality gas shall contain no oxygen, dirt, dust, gum, or other impurity in sufficient amounts to require the buyer to incur processing costs to eliminate such im-

purities in order for the gas to meet either customary commercial standards or the customary requirements of any of the interstate pipelines in the area.

f. *Pressure:* Pipeline quality gas shall be delivered at a pressure of not less than 800 pounds per square inch.

g. *Btu Adjustment:* (For new gas-well gas only). The maximum standard will be 1,050 Btu's per cubic foot at 14.73 psia and 60° F. and the minimum standard will be 1,000 Btu's per cubic foot at 14.73 psia and 60° F. Upward and downward

adjustments of the base area rates will be permitted on a proportional basis as specified at pages 99-100 of this opinion if the Btu content exceeds the maximum standard or is below the minimum standard.

(2) When a purchaser buys gas which deviates from the quality standards established in subparagraph (1) above, the base area rate fixed in ordering paragraph (A) shall be adjusted for any deviations from such standards as follows:

a. The applicable base area rate shall be adjusted downward by the net cost of processing the gas to bring it up to standard.

(i) If the processing is performed by the purchaser, a reasonable return upon the net investment should be included as part of the processing cost incurred in bringing the gas up to pipeline quality.

(ii) If processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

b. The applicable base area rate for new gas-well gas only shall be adjusted downward or upward by the amount of any applicable Btu adjustment and by the concomitant amount of any saving or additional expenses to the seller from any reduction or increase in taxes or royalty payments resulting therefrom.

(C) Applicable area rate, as that term is used herein, shall mean the base area rate established by ordering paragraph (A) or the rate determined after adjustment, if any, of that base area rate for the deviations from the quality standards established by ordering paragraph (B).

(D) The applicable area rate as defined in ordering paragraph (C) above, shall be effective from and after the effective date hereinafter defined and any amounts collected in excess thereof from and after such effective date shall be subject to refund plus interest at 7 percent. In addition,

with respect to the rates involved in the Section 4(e) proceedings set out in Part III of Appendix A, the applicable area rate as defined in paragraph (C) above, shall be effective from the date such Section 4(e) rates were collected subject to refund and all amounts collected under those Section 4(e) rates in excess of the applicable area rate shall be subject to refund from the date such excess was collected plus interest at the rate

specified in the respective Section 4(e) proceeding, in accordance with the provisions of ordering paragraphs (I) and (J) herein.

(E) Within 45 days from the effective date hereinafter defined each respondent shall file a supplement to each applicable rate schedule, effective as of the effective date hereinafter defined, reflecting any reductions required to bring any or all of its rates into conformity with the applicable base area rate established by ordering paragraph (A) herein.

(F)(1) Within 90 days from the effective date hereinafter defined, each respondent listed in Part I or Part III to Appendix A (except those exempted by subparagraph (3) hereof) shall file with the Commission a statement in conformity with Appendix D to this opinion for each rate schedule such respondent has on file with this Commission for the sale of natural gas produced or sold within Texas Railroad District No. 7-c, Texas Railroad District No. 8, or the New Mexico counties of Lea, Eddy or Chaves. Such statement shall set forth either that the gas accords with all pipeline quality standards established herein, or in which respects the gas deviates from the particular quality standards established herein; the agreed cost to the purchaser of processing the gas to bring it to the pipeline quality standards established herein with respect to each quality deviation; any upward or downward Btu adjustment for new gas-well gas; and the resulting applicable area rate for the gas. Such statement shall be signed by both the seller and the purchaser. If the seller and the purchaser

(ii) If processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

b. The applicable base area rate for new gas-well gas only shall be adjusted downward or upward by the amount of any applicable Btu adjustment and by the concomitant amount of any saving or additional expenses to the seller from any reduction or increase in taxes or royalty payments resulting therefrom.

(C) Applicable area rate, as that term is used herein, shall mean the base area rate established by ordering paragraph (A) or the rate determined after adjustment, if any, of that base area rate for the deviations from the quality standards established by ordering paragraph (B).

(D) The applicable area rate as defined in ordering paragraph (C) above, shall be effective from and after the effective date hereinafter defined and any amounts collected in excess thereof from and after such effective date shall be subject to refund plus interest at 7 percent. In addition,

with respect to the rates involved in the Section 4(e) proceedings set out in Part III of Appendix A, the applicable area rate as defined in paragraph (C) above, shall be effective from the date such Section 4(e) rates were collected subject to refund and all amounts collected under those Section 4(e) rates in excess of the applicable area rate shall be subject to refund from the date such excess was collected plus interest at the rate

specified in the respective Section 4(e) proceeding, in accordance with the provisions of ordering paragraphs (I) and (J) herein.

(E) Within 45 days from the effective date hereinafter defined each respondent shall file a supplement to each applicable rate schedule, effective as of the effective date hereinafter defined, reflecting any reductions required to bring any or all of its rates into conformity with the applicable base area rate established by ordering paragraph (A) herein.

(F)(1) Within 90 days from the effective date hereinafter defined, each respondent listed in Part I or Part III to Appendix A (except those exempted by subparagraph (3) hereof) shall file with the Commission a statement in conformity with Appendix D to this opinion for each rate schedule such respondent has on file with this Commission for the sale of natural gas produced or sold within Texas Railroad District No. 7-c, Texas Railroad District No. 8, or the New Mexico counties of Lea, Eddy or Chaves. Such statement shall set forth either that the gas accords with all pipeline quality standards established herein, or in which respects the gas deviates from the particular quality standards established herein; the agreed cost to the purchaser of processing the gas to bring it to the pipeline quality standards established herein with respect to each quality deviation; any upward or downward Btu adjustment for new gas-well gas; and the resulting applicable area rate for the gas. Such statement shall be signed by both the seller and the purchaser. If the seller and the purchaser

are unable to agree upon any or all of the particulars entering into the computation of the applicable area rate, the seller shall file the statement herein required which shall indicate the absence of agreement and supply the information required to compute the applicable area rate as well as the contentions of the parties with respect to the quality and amount of the adjustment for any item in dispute. The purchaser may file a separate statement setting forth its views within the period herein provided.

(2) The statement filed hereunder which reflects full agreement between seller and purchaser shall be deemed accepted by the Commission unless the Commission, within 60 days after such filing, shall otherwise order. In the event of disagreement between the seller and purchaser or, where the Commission otherwise determines that the statement filed is inconsistent with the provisions of ordering paragraph (B) herein, the Commission will, after appropriate proceedings, prescribe the applicable area rate to be applied as of the effective date hereinafter defined.

(3) Any respondent listed in Part I or Part III to Appendix A is exempt from filing the statement required by subparagraph (1) hereof for any sales which are "small producer sales" as defined in the rule providing for small producer certificates proposed this date, if within 45 days from the effective date hereinafter defined such respondent files the information requested in Appendix E to this

opinion required to qualify for a small producer certificate for such sales. If the Commission subsequently finds that such a producer does not qualify as a small producer such applicant shall be required to file the statement required by subparagraph (1) hereof within 90 days after any such Commission finding.

(G) *Minimum Rates*

(1) Minimum rates for natural gas produced in the Permian Basin area are hereby established as follows:

For gas meeting all pipeline quality standards *9 cents per Mcf* at 14.65 psia.

For gas not meeting all pipeline quality standards as established herein *9 cents per Mcf* reduced by the amount of any adjustments for quality as provided in ordering paragraph (B).

(2) All respondents who are currently making sales subject to the jurisdiction of this Commission and produced in Texas Railroad District No. 7-c, Texas Railroad District No. 8, or any of the New Mexico counties of Lea, Eddy or

Chaves, are hereby authorized to apply for increases to the minimum rates fixed in subparagraph (1) hereof. Such applications shall be accompanied by the information required in Appendix D to this opinion, signed by the seller (or the agent or operator). Increases to the established applicable minimum rate will be granted notwithstanding

contractual provisions to the contrary which are hereby modified *pro tanto*.

(H) *Moratorium on Rate Increases*

No respondent listed in Part I and Part III of Appendix A to this opinion shall file any change in rate providing for a price in excess of the applicable area rate prior to (1) subsequent order of the Commission in this proceeding permitting such filing or (2) January 1, 1968, whichever is earlier. All contracts of the respondents listed in Part I of Appendix A relating to sales of natural gas subject to the jurisdiction of this Commission and produced in Texas Railroad District No. 7-c, Texas Railroad District No. 8, or any of the New Mexico counties of Lea, Eddy or Chaves shall be deemed amended, pursuant to Section 5(a) of the Natural Gas Act, by the inclusion of the following language:

> From the effective date of the order of the Federal Power Commission in the Permian Basin Area Rate Proceeding, AR61-1, (therein defined as September 1, 1965), until January 1, 1968, no increase in rates may be filed, except in compliance with a specific order of the Commission for a rate in excess of the applicable area rate as determined pursuant to said proceeding or pursuant to later order of the Commission.

(I) *Refund Reports*

Within 120 days from the effective date hereinafter defined a refund report shall be filed with this Commission in triplicate by each respondent involved in one or more of the Section 4(e) proceedings set out in Part III of Appendix A to this opinion. The report shall set forth

the following information (if more than one rate schedule is involved the respondent shall supply the information for each schedule separately):

(i) The rate collected during the period subject to refund, and the periods during which each rate was collected.

(ii) The volume of gas sold at each such rate.

(iii) The difference between the total amount collected during the period subject to refund and the applicable area rate as defined herein. If seller and buyer do not agree upon the items necessary to the computation of said rate, the seller shall make this computation on the basis of the information supplied by the seller in the statement required by ordering paragraph (F) subject, however, to the terms of subparagraph (2) thereof.

(iv) The interest, at rates as specified in each Section 4(e) proceeding, on the amount collected during said period in excess of the applicable area rate. The interest shall be calculated to the date of the report.

(J) *Treatment of Refunds*

Each respondent shall retain the amounts shown in the report required under ordering paragraph (E) subject to further order of the Commission directing the disposition of those amounts. If a respondent elects to commingle these retained refunds with its general assets and use them for its corporate purposes, and after notice to the Commission it is specifically authorized so to do, it shall pay

interest thereon at the rate of 4.5 percent per annum on all funds thus available from the date of the filing of the refund report to the date on which they are paid over to the person ultimately determined to be entitled thereto in a final order of the Commission. If a respondent elects to deposit the retained refunds in a special escrow account, the respondent shall tender for filing on or before the date of the filing of the refund report an executed Escrow Agreement, conditioned as set out below accompanied by certificate showing service of a copy thereof upon each of its jurisdictional customers. Unless notified to the contrary by the Secretary within 30 days from the date of filing thereof, the Escrow Agreement shall be deemed to be satisfactory and to have been accepted for filing. The Escrow Agreement shall be entered into between respondent and any bank or trust company used as a depositor for funds of the United States Government and the agreement shall be conditioned as follows:

277,704

(1) Respondent, the bank or trust company, and the successors and assigns of each, shall be held and formally bound unto the Federal Power Commission for the use and benefit of those entitled thereto, with respect to all amounts and the interest thereon deposited in a special escrow account, subject to such Agreement, and such bank or trust company shall be bound to pay over to such persons or persons as may be identified and designated by final order of the Commission and in such manner as may

be therein specified, all of any portion of such deposits and the interest thereon.

(2) The bank or trust company may invest and reinvest such deposits in any short-term indebtedness of the United States or any agency thereof or in any form of obligation guaranteed by the United States which is respectively payable within 120 days as the said bank or trust company in the exercise of its sound discretion may select.

(3) Such bank or trust company shall be liable only for such interest as the invested funds described in Paragraph (2) above will earn and no other interest may be collected from it.

(4) Such bank or trust company shall be entitled to such compensation as is fair, reasonable and customary for its services as such, which compensation shall be paid out of the escrow account to such bank or trust company. Said bank or trust company shall likewise be entitled to reimbursement for its reasonable expenses necessarily incurred in the administration of this escrow account, which reimbursement shall be made out of the escrow account.

(5) Such bank or trust company shall report to the Secretary quarterly, certifying the amount deposited in the trust account for the quarterly period.

(K) No respondent shall file hereafter any change in rate providing for a price in excess of the applicable area

where the contractual right to such filing is based upon any contractual provision which would not be permitted by subsections (a), (b) and (c) of Section 154.93 of the Regulations under the Natural Gas Act.

(L) Notwithstanding the issuance of this final order, these proceedings shall remain open for such further action as may be necessary with respect to individual respondents and such other action as may be necessary in the premises.

(M) Except as herein granted the exceptions to the initial decision and proposed order are hereby denied.

(N) The date of issuance of this opinion and order within the meaning of Section 19(a) of the Natural Gas Act is the date shown on page one of the opinion immediately below the title thereof. The term "effective date hereinafter defined" (as it is used in the ordering paragraphs herein) is September 1, 1965.

By the Commission. Commissioner O'Connor filed a separate statement concurring and dissenting on limited issue.

Area Rate Proceeding Claude E. Aikman, *et al.* North Central Oil Corporation, (Operator), *et al.*	Docket Nos. AR61-1 G-18466, *et al.* CI60-435, *et al.*

O'CONNOR, Commissioner, *concurring and dissenting on limited issue:*

(Issued August 5, 1965)

The Commission's decision issued today is a significant event in the evolution of our area rate policies, and, on the basis of the record before us, it establishes just and reasonable rates for natural gas producers in the Permian Basin. It is my opinion that our extensive investigation has been synthesized into a meaningful system of regulation, and, for the purposes of our initial area proceeding, I endorse the consideration of costs. The cost analysis we utilize is a useful and proper determination of the financial requirements of the industry, and the results are defensible. I therefore concur in the Commission's opinion, including, of course, the procedures for implementation of the rates we establish; my dissent is limited to one issue.

While I join for present purposes, I am convinced that the experience gained in this costly and expansive proceeding justifies a simplification of the trial and disposition of future area proceedings. Price control being our objective, it is clear that the interests of producers and consumers can be adequately protected under expedited procedures based upon reasonable market prices. The record in this case fully establishes that the contract price

at which most producers are able and willing to operate is just and reasonable. This standard provides the measure of inducement that has been successful in providing an excellent source of energy for use in all sectors of the Nation. Thereby, any policy that focuses on profits realized, as recommended by some parties before us, would be avoided, and the focus would be on supply elicited, which policy we here endorse. Furthermore, it is preferable to tolerate such imperfections as might result from area regulation in the interest of avoiding complicated cost-plus methodology.

The contract price is the measure of inducement. Composite costs best serve as a check on average field prices to preclude significant price departures. Our judgment should rest primarily on the market place where we can rely on competition to determine just and reasonable rates. In the hope that they will become the rule, I hereby express my additional views and recommendations.

277,707

PRELIMINARY CONSIDERATIONS

In 1954 the Supreme Court made the unexpected determination that this Commission has jurisdiction over the interstate sales of natural gas producers and that it has a corresponding obligation to regulate those sales in the public interest. For fourteen years prior to that decision the Commission had repeatedly rejected the jurisdictional argument, and, due to the obvious difficulty of the task, the Commission had regularly recommended legislation

granting only limited regulation over producers. In 1956 the Congress acquiesced in this view by approving such legislation, only to see it rejected by Presidential veto for reasons totally removed from the merits of the bill itself. Today, more than a quarter-century after the Natural Gas Act was adopted, and eleven years after this Commission was granted jurisdiction over producer sales, a decision has been reached which accommodates to an intent that prices for natural gas be regulated. However, although the law compels an embarkation into price control during peacetime, it does not dictate a single methodology, and herein lie my separate recommendations for future area decisions.

The task of selecting a reasonable approach to regulation that will reflect the practical necessities before us is a difficult one, but cognizance of several factors will make an acquittal of the duty more meaningful. The production of natural gas is an industry in which there is an intricate interplay of special market circumstances. Pipeline control over field prices presents awesome monopsonistic powers. Problems of waste and correlative rights compel state conservation regulation. Shared problems with oil lead to an overlapping of economic interests. Public utility characteristics at the transmission and distribution end go so far as to generate demands for price controls over the producing industry. The absence of traditional public utility characteristics in the production of natural gas presents problems that are directly antithetical to the transmission or distribution of the commodity; there is not the same direct relationship between investment and

output at the crucial focus of the individual company, and there is certainly no legal obligation to provide new services. Reflecting these multifarious consideration, Justice Jackson observed, "If natural gas rates are intelligently to be regulated we must fit our legal principles to the economy of the industry and not try to fit the industry to our books." *F.P.C. v. Hope Natural Gas Co.*, 320 U.S. 591, 650 (1944). In that opinion he emphasized,

> It is necessary to a "reasonable" price for gas that it be anchored to a rate base of any kind? Why did courts in the first place begin valuing "rate bases" in order to "value" something else? The method came into vogue in

> fixing rates for transportation service which the public obtained from common carriers. The public received none of the carrier's physical property but did make some use of it. The carriage was often a monopoly so there were no open market criteria as to reasonableness. The "value" or "cost" of what was put to use in their service by the carrier was not a remote or irrelevant consideration in making such rates. Moreover, the difficulty of appraising an intangible service was thought to be simplified if it could be related to physical property which was visible and measureable and the items of which might have market value. The court hoped to reason from the known to the unknown. But gas fields turn this method topsy turvy. Gas itself is tangible, possessible, and does have a market and a price in the field. The value of the rate base is more elusive than that of gas. It consists of intangibles — leaseholds and freeholds — operated and unoperated — of little use in themselves except as rights to reach and capture gas. The value lies almost wholly in predictions

> of discovery and of price of gas when captured, and bears little relation to cost of tools and supplies and labor to develop it. Gas is what Hope sells and it can be directly priced more reasonably and easily and accurately than the components of a rate base can be valued. Hence the reason for resort to a roundabout way of rate base price fixing does not exist in the case of gas in the field. 320 U.S., 647-48.

Regulatory authority must be employed as the characteristics of the industry dictate. Congress and the courts have refused to confine permissible principles of procedure to a narrow corridor; by granting the Commission flexibility, they implicitly recognized the wisdom of the Justice's words.[1]

By these distinct considerations, the purpose and the method of price regulation is presented in its proper perspective, and they should dictate the results required. Where a compulsory service obligation exists the only regulatory problem is to appraise a service that must, of legal necessity, be rendered. Where the output is direct and constant, the value of the service thus performed, in terms of the allowed rate, can legitimately be referenced to a reasonable yield on the actual costs involved. In the absence of this obligation, however,

the role of appraising the services performed assumes a decidedly different function: the problem becomes that of

[1] See, e.g., *Wisconsin* v. *F.P.C.*, 373 U.S. 294 (1963); *Colorado Interstate Gas Co.* v. *F.P.C.*, 324 U.S. 58 (1945); *F.P.C.* v. *Natural Gas Pipeline Co.*, 315 U.S. 575 (1942); *Bel Oil Corp.* v. *F.P.C.*, 255 F.2d 548 (5th Cir. 1958); *Forest Oil Corp.* v. *F.P.C.*, 263 F.2d 622 (5th Cir. 1959).

fixing a price based, not only upon what must be performed, but primarily upon what will induce the product. The regulatory emphasis shifts. It is not so much actual cost as it is market cost; not only prudent return but incentive prices; not just cost of service but also cost of supply. These multifarious considerations are so well established that there should be no need for further discussion. They were made explicit in our decision to focus on area rate-making and have been consistently reaffirmed. *Phillips Petroleum Company* 24 F.P.C. 537, 542-548 (1960); *aff'd,* 373 U.S. 294, 308-310 (1963). That decision compels thorough consideration of the factors that determine a reasonable market price.

It has been argued that *en masse* cost proceedings contain an inherent incentive for low cost producers since their profits are limited only by ceilings premised on much higher costs. Group cost proceedings may offer more incentives than individual proceedings, but if the history of pipeline production and its regulation by this Commission on an individual cost basis is any indication, cost regulation as a general principle in utility regulation does not provide the necessary system. By such control, there has been a 25 per cent decrease in the ratio of actual pipeline production over a six-year period: in 1957, pipeline production was 11.69 per cent of purchases; in 1958, 10.56 per cent; in 1959, 10.87 per cent; in 1960, 10.38 per cent; in 1961, down to 9.57 per cent; and in 1962, only 8.78 per cent. See *Sales by Producers of Natural Gas to Natural Gas Pipeline Companies* (F.P.C. 1963). These statistics are for individual companies as composited on an annual basis.

It has also been argued that, if total industry costs plus a reasonable return are recovered, then gas will continue to be found. Total costs are not recovered under group cost regulation; the higher cost producers, which must be considered in any statistical compilation, will still not be made whole. Moreover, gas is found by the individual decisions and acts of thousands of producers. To them, incentives must relate to profits available in other sectors of the economy. If the maximum price any one producer can obtain from his production is insufficient, as he might determine *vis-a-vis* his own interests and alternative investments, it is of little concern to him that the ceiling was premised on the larger percentage of the industry's costs. So long as there is a reasonable likelihood that his prices will be reduced below his contract terms or his certificate conditions, he will not have the necessary incentive to commit funds for further exploration.

277,710

I emphasize, in full agreement with our opinion, that the area rates we are to determine have a single, overriding purpose: to control the available supply of natural gas; and those rates have but one utilitarian function: to be high enough, but only high enough, to accomplish this policy function. In the context of area pricing, just and reasonable rates can best be used as a measure to elicit the necessary supply. So viewed, price control is the overriding policy. The function should be accomplished, and the standard should be employed, in the most direct and least dilatory manner possible.

REGULATION BASED SOLELY ON COSTS

The Commission places primary reliance for its answer in this initial case upon cost-plus regulation. This accepted formulation is little more than individual cost of service applied on an area basis to an averaging of composite costs. In making this determination, we must grapple with Gordian problems that do not readily accommodate to precise disentanglement; for our purposes here, cost analysis defies mathematical logic. Nevertheless, the focus in this proceeding on such costs make it both necessary and proper that we determine the financial requirements of the industry.

Costs as a Basis for Comparison

The major emphasis in the Commission opinion on cost-plus regulation appears to stem from a conviction that costs *must always* be the primary basis for regulation. I believe we have more flexibility, particularly for future proceedings, than is suggested there. The leading authority on this issue is *F.P.C.* v. *Hope Natural Gas Company*, 315 U.S. 575, where the Supreme Court declared:

> It is not the theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust or unreasonable, judicial inquiry is at an end. The fact that the method employed to reach that result may contain infirmities is not then important.

The tenor of the above quotation supports the general proposition that regulatory agencies are to be accorded a strong presumption of validity in determinations that

must be based largely on commission expertise. Certainly producer regulation qualifies as a subject matter in which there should be large scope for Commission innovation and adaptation to the economic facts of life in the industry. The Commission opinion, in my view, charts too narrow a course for the future. Cases such as *City of Detroit* v. *F.P.C.*, 230 F. 2d 810 (1956), where the D. C. Circuit Court

reversed a Commission determination which would have allowed a pipeline the field price for its purchases of natural gas from an affiliated producer, do not bind us to costs alone. The Commission had there sought to avoid the complicated and time-consuming "rate-base" method, which is presently relied upon for the flowing gas price albeit on an area basis. The circuit court reversed, holding that the purposes of the Natural Gas Act require that costs be considered; however, the opinion emphasized that this was to be regarded as no more than a starting point. Thus, the Court there stated:

> . . . though we hold that method [the rate base or cost of service method] not to be the only one available under the statute, it is essential in such a case as this, that it be used as a basis of comparison. It has been repeatedly used by the Commission, and repeatedly approved by the courts, as a means of arriving at lawful — "just and reasonable" rates under the Act. Unless it is continued to be used at least as a point of departure, the whole experience under the Act is discarded and no anchor, as it were, is available by which to hold the terms "just and reasonable" to some recognizable meaning.

(277,711)

The above language was relied upon by the Fifth Circuit in another proceeding, *Bel Oil Corporation* v. *F.P.C.*, 255 F. 2d 548 (1958), where that court was faced with an allegation by certain producers that the Commission should base just and reasonable rates on field prices. The court rejected this contention, saying:

> We cannot agree [to] the proposition that the evidence thus far adduced makes out a *prima facie* case of reasonableness of the contract price of 16 cents. We do not hold that the evidence of field price is irrelevant. We do hold that evidence of unregulated prices in the field is not sufficient to warrant a finding by the Commission that a price comparable to them is just and reasonable within the intendment of the Natural Gas Act. *Id.*, at 553.

The Court further observed:

> The regulation of the prices at which thousands of "natural gas companies" may sell to the pipeline companies is a difficult one at best. It is a field which in many respects requires new formulas to test what is just and reasonable.

277,712

Rebutted in efforts to rely solely on contract prices, the Commission commenced the seemingly interminable task of determining just and reasonable rates to be allowed on an individual company cost of service basis for the country's major producers of natural gas. Realizing the futility of the individual cost approach, the Commission made the necessary determination that area rates be utilized. Significantly, the decision marked a step away from the individual company costs; the emphasis shifted to other economic indicia. New formulae for public util-

ity regulation were necessary. It became possible under area pricing that some producers might not be able to operate under ceilings; it also raised the possibility that many producers would receive high rates of return simply because of the success of their operations. The departure signalled the demise of cost-plus regulation for natural gas producers. Recognition was accorded the fundamental difference that exists between the producer of a commodity and the seller of a service. The latter is readily amenable to utility regulation; the former clearly is not. Significantly, the same court that decided *City of Detroit* affirmed the departure from costs in the *Second Phillips* litigation. In 303 F. 2d 308 (D.C. Cir. 1961) Chief Judge Prettyman, author of *City of Detroit,* declared:

> . . . But what of a fair price for a commodity bought and sold by a merchandiser? Almost the whole of the economics of merchandising differs from the economics of public utility service. Are the just and reasonable prices of such a merchandiser limited to fair returns on his own investment and prices paid by him (and, if so, what investment and what prices), or are those prices reasonably measured by the fair prices for the product as measured by the open competitive market for the product, evaluated by Commission expertise and data on the whole of the market operation? Either criterion is a method of regulation. It seems to us that the choice must lie with the Commission. *Id.*, at 388.

In turn, the Supreme Court affirmed the area approach, 373 U.S. 294 (1963). Significantly, it there declared:

> We recognize the unusual difficulties inherent in regulating the price of a commodity such as natural gas. We respect the Commission's considered judg-

ment, backed by sound and persuasive reasoning, that the individual company cost-of-service method is not a feasible or suitable one for regulating the rates of independent producers. We share the Commission's hopes that the area approach may prove to be the ultimate solution. *Id.*, at 310.

277,713

Although repeating assurances at oral argument that "composite cost-of-service data" would be considered, the Court went on to say that *City of Detroit,* insofar as it required cost regulation, is to be distinguished from area pricing because the circuit court did not have before it any questions relating to the area rate method. This precedent leads inexorably to the conclusion that, even though some consideration of costs may be required for an initial area pricing formula, the cost approach need not, in circumstances of workable competition, be the governing methodology. Nevertheless, five years after the area approach was initiated in *Second Phillips,* and over twenty years after the Court observed that "he who would upset the rate order under the [Natural Gas] Act carries the heavy burden of making a convincing showing that it is invalid because it is unjust and unreasonable in its consequences." . . . *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591, at 601 (1944), this Commission retains its attachment to cost-plus. In the light of compelling authority, it must be concluded that fears of judicial review need not be entertained to preclude Commission departure from strict adherence to cost-plus. In this proceeding there has been an extensive investigation into the operations of producers, with all parties having received a thorough opportunity to

present their separate views and to review the evidence presented by others. Beyond a doubt, with due consideration being accorded the many difficulties inherent in any cost analysis of a joint product, it is clear that the prices adopted today bear a close and substantial relation to the weighed average prices negotiated in the field. The cost-plus rate and the negotiated contract rate fall within that zone of reasonableness that is essential to regulation. Therefore, it is not required in future proceedings that costs be the beginning and the end of just and reasonable rates. The time is ripe to abandon costs as the sole referential. Among the alternatives, competition has been shown to be sufficient to provide an appropriate and compelling measure of just and reasonable rates.

Inherent Limitations in Cost-plus Regulation

Cost-plus regulation alone is not an objective, independent determinant for just and reasonable prices for producers. Any determination upon evidence of costs will necessarily depend on numerous pragmatic adjustments that will, without consideration in detail of other relevant factors, permit a certain amount of variation that could otherwise be controlled. It is no difficult matter to appreciate the problem. Staff concedes that "costing for producers of gas is not, and likely never will become, as precise as is customary in utility regulation." The major inherent difficulties are fourfold.

277,714

Fundamentally, the factual and statistical presentations relied upon in the main opinion are but estimates. There

are immense difficulties in the collection, selection, and presentation of data. Voluminous questionnaires are issued, but many go unreturned. Staff Appendix data in the largest of the five size categories is based on 93.8 per cent of the producers. In the next largest group only 30.9 per cent are available. The percentages are dropped drastically to 8.0 per cent in the third group, to 2.7 per cent in the fourth, and to but 0.8 per cent in the smallest. Although the excellent response in the largest category does provide good area cost coverage, there is a notable exception by the absence of crucial exploratory drilling costs. Specifically, unrecorded dry holes are of necessity incomplete. Any meaningful anticipation of probable accuracy is weakened by an absence of fully reliable statistical verity. Perhaps these deficiencies could be cured in the future, but the precipitous decrease for available questionnaire data on the small producer groups presents more fundamental problems, particularly since the small producers drill the greater proportion of exploratory wells. The smaller producers operate on extremely limited resources and are thus less likely to maintain books that would be adequate to provide meaningful replies. While 67 of 68 Appendix B questionnaire responses for the second largest group are acceptable for compositing purposes, 46 of the 105 Appendix C responses were inconsistent or incomplete to the extent that their data was entirely excluded. Consequently, as sales and production volumes decrease data credibility likewise decreases. Exhibit 255, among others, indicates there is an exact inverse relationship between sales volumes and per unit costs; as the former decrease, the latter increase. This statistical inac-

curacy means that primary reliance on questionnaire data places the small producer — the one most likely to be undercut through *enmasse* normative costing — in a triple squeeze: due to the high cost of compilation, a low percentage can submit cost data; a high percentage of the data submitted must thus be rejected; and such responses as finally filter into a composite exhibit must be discredited for low coverage on a voluntary basis.

Despite these inherent deficiencies, the issuance of the questionnaires is not inutile. To the contrary, their submission has been of notable assistance in arriving at rates which are just and reasonable, and in establishing, as evidenced in our opinion, that negotiated field prices are within the permissible zone of reasonableness, even from a cost perspective.

Of necessity, the Commission had to supplement questionnaire data by amplifying the information available from various published sources. Although this reinforces some aspects of

data reliability, other problems arise in proportion. The separate publications are usually limited to the very large operators, and are thus even more restricted than under the questionnaire responses. Coverage of these outside sources is usually national and international, so that expenditures are presented in broad categories that portray many meaningful items in a single dollar total; consequently, specific cost items that should require special regulatory treatment cannot be separately identified for

the Commission's purposes. As various sources are necessarily utilized, approximation of these unknown components is effectively prevented by the obscure or overlapping categorizations used by each source. Statistical probability thus declines and, although such cost analysis provides a "zone of reasonableness" within which the required pragmatic adjustments can properly be made, there is no precise objective standard for the purposes of the industry.

After the cost components are adopted, the circular ceremony known as cost allocation begins. We have avoided some of the pitfalls, but our reliance on even the semblance of allocation requires that we exercise our judgment within a fairly broad range of rates. By definition, allocations occur because certain costs cannot be directly identified with certain functions of the various identifiable products or assets, and allocated costs thus present a distinct existence apart from directly ascertainable costs. Where the ratio to total industry costs is small, the gaps are insignificant; however, as the ratio increases, both the costs and the resulting rates, to the extent directly transferred, become less reliable and more subject to adjustment. As the speculative base becomes more pronounced, the choice of allocation formulae can produce a wider range of rates, but the logical relationship between any resulting rate and the current costs of supply becomes even more remote. Although the courts may have declared that "It is not the theory but the impact of the rate order which counts," I do not believe that merely because the results reached today are reason-

able and have a valid reference to the prevailing market price at the well-head that cost-plus should be employed in the future as the sole referential. The imprecise determinations can only be a transcendent command unduly complicating later proceedings, and the analytic principles evoked can have but the validity of a foregone conclusion.

The difficulties involved in allocations are not hard to appreciate. The allocations problem confronted by the Commission is that of attributing legitimate, but separate, costs to a largely joint product. According to witness Sherwin,

277,716

the costs attributable to associated gas are 100 per cent joint, as that term is technically employed, and, for non-associated gas, 31 per cent joint and 24 per cent shades of joint and common. Thus, even for non-associated gas, only 45 per cent of the costs are directly attributable to the product committed to our jurisdiction. The Commission has previously stated the implications of this:

> While we must make allocations in all rate cases, the amounts involved in electric and gas pipeline cases have been comparatively small, and the allocations relatively simple. In the case of a producer, the amounts involved in the allocations of costs are major in size and extremely difficult to make. The result is that a producer actually could become bankrupt, or could make enormous profits, depending merely upon the methods of allocation used. 24 FPC, at 543-544.

Strict adherence to allocation formulae would produce a spectrum of rates so wide and variant as to lend a sophist's support for the extremes, and as a practical matter to be capable of producing clearly unrealistic results. In such a case, as well as in the case of prescribed rates that come to rest somewhere between the extremes, the supposedly independent determination of legitimate costs is actually based upon pragmatic adjustments of either the formulae employed or, in a guise of expertise and trending, of the deceptively precise mathematical resultants. This certainly is no well-guarded secret:

> When an unrealistic result is reached, the formulae for allocations must be changed, in order to bring about a reasonable result. The allocation methods then become a means of supporting a result already arrived at, rather than a means of arriving at a result which was previously unknown. *Id.*, at 544.

Finally, even after statistical costs are collected, compiled, selected, allocated, and invariably trended and modified, they must still be related to reserve additions before the desired costs per Mcf can be found. An understatement of reserves found causes high per unit costs, and thus results in high rates. An overstatement has the reverse results. Despite the confidentiality attached by producers to their reserve figures, the industry's cooperation in this proceeding prompted them to submit a composite exhibit of estimated reserves for the Permian Basin. In addition, there are numerous published sources for reserves estimates. Nevertheless, such figures are no more than estimates, and their estimation entails a considerable degree of subjectivity. This is revealed on the

record before the Commission as was similarly disclosed in the investigation into Phillips' individual costs. See 24 FPC, at 544.

The statutory function of rate regulation is to arrive at reasonable results, and no criticism can be levelled at the attempt to stay within a zone of reasonableness. The use of composite figures to explain economic behavior is clearly a most useful analytic system; however, reliance on allocations, estimates, and other variations of expertise are not the only independent referentials that are desired or that can be utilized.

To the extent that cost analysis is productive of reasonable results, and with one exception our opinion today meets this judicial standard, it would be most helpful for our regulatory purposes if ascertainment of a producer's investment were to be presented on a basis conforming to sound accounting practices. The derivation of a return allowance is a three-step computation: first, ascertainment of the investment; second, determination of the period of time over which the investment is to be allowed a return; and, third, ascertainment of the rate of return. I concur in the Commission's determination on this issue because, on the record in this case, no other disposition is feasible. However, it appears that the yield concept deserves full consideration in future proceedings as a reasonable alternative that might be preferable to traditional methods.

In a 1963 publication by Arthur Andersen & Company, entitled *Accounting for Oil and Gas Exploration*

Costs, it is concluded that the present practice of the industry of expensing exploration and development costs as incurred is in discord with accounting and economic principles. Written for the limited purpose of discussion and study, the publication recommends that leasing, acquisition, carrying, drilling, geological, and other such costs, as well as general and administrative costs related to exploration and overhead, be capitalized and later amortized on an overall unit-of-production basis as production occurs. It states, "[s]uch aggregate costs include nonproductive exploration costs which, in our opinion, are capital in nature," and later, "[t]hey should be capitalized since they are just as much a part of the cost of the reserves found as are the lease and well equipment on the producing wells." The pamphlet recognizes, however, that ". . . appropriate recognition should be given to such current reductions in income taxes as may result from the current deduction of such capitalized costs for income taxes as incurred. This is essential to a proper determination of costs."

The recommendation in the pamphlet may also be sound for regulatory purposes. At least, as recommended by Staff witness

Spain, that portion of it which advocates full cost accounting for all finding expenditures should be thoroughly explored. Any lesser treatment is a refusal to recognize the full cost of acquiring productive assets. Such cost accounting has been undertaken on a very limited basis by the industry, and it appears that the results have pro-

vided more accurate knowledge of the functioning of the industry and of the results of expenditures. Without going into detail at the present, I believe the true yield method may be shown not to change the rates here established. In any event, it is not possible to utilize this control for our decision today: the record is not adequate, the various recommended returns are not directly transferable, and the industry has not generally accepted the principles involved.

AN APPROPRIATE BASIS FOR DECISION

These limitations inherent in cost-plus producer regulation do not, however, spring only from the allocations and adjustments, nor only from the inherent difficulties of data collection, selection, and compilation, nor only from the resulting deficiencies in the construction of a legitimate costing model, nor only through deemphasis of available reserves estimates. I believe the facts in this case reveal that in the future the Commission need not be confined to cost-plus regulation. The accusation of "drastic inflationary cycles" in wellhead prices in the last twenty years stands rebutted. As a matter of general principle, it is not sound to argue that cost-plus regulation cannot be supplemented because the rise in wellhead prices, experienced in the recent past, was due to producer-dictation of contract prices; that those prices were grossly in excess of cost trends; further, that the wellhead price increase was directly reflected in burner tip increases, albeit four-fold that at the wellhead; and, finally, that any attempt to consider factors in addition to cost-plus regulation would constitute an abdication of

responsibility, and would result only in another round of similar, allegedly violent, price jumps.

The propriety of the price rise since 1945

Any detailed discussion of the accusation of price-dictation by producers will not be undertaken here;[2] however, long

experience with the industry is convincing that, where price dictation exists, it is seldom with the seller. All available information and discussion lead persuasively to the conclusion that field prices are set after vigorous bargaining within a context of numerous restrictive economic forces. More particularly, in the Permian, there has been an essentially monopsonistic environment whereby the transmission company in a particular field would set, on a unilateral basis, the fixed, maximum rate for natural gas in the area. Accomplishing this unilateral price-dictation is particularly possible for a company free of economic constraint. This was the situation for El Paso Natural Gas Company. El Paso not only purchases over 70 per cent of the interstate Permian gas, but it also produces over 15 per cent of its total volumetric purchases. In this connection it should be noted, as was established by the record in *United Gas Pipe Line Com-*

[2] The problems are well-documented in numerous professional journals and academic surveys. Reference is made particularly to MacAvoy's *Price Formulation in Natural Gas Fields,* (Yale University Press, 1962); Neuner's *The Natural Gas Industry; Monopoly and Competition in Field Markets,* (University of Oklahoma Press, 1960); and Cookenboo's *Competition in the Field Market for Natural Gas,* (The Rice Institute Pamphlet, 1958).

pany, Docket No. RP63-1, 31 FPC, at 55 (1964), wellhead prices are uniformly depressed in areas where pipeline production is prevalent. Nevertheless, many have argued that, if transmission companies had possessed any bargaining leverage, the recent rise in gas prices *could not have occurred*. This argument must be rebutted.

It is clear that the wellhead price increases of the 1950's began at levels not even remotely approximate to the cost or value of separately found reserves. No responsible authority disputes this position. As late as 1960, this Commission is on record that:

> . . . rigid adherence to the rate base method will, in many cases, price the producers' gas completely out of market. This fact is now abundantly clear: Regardless of variations in allocations methods, allowance for incentives, and other disputed factors, computations of the cost of natural gas which have been presented in the many cases before us show that natural gas has been, in most instances, substantially underpriced. 24 FPC, at 547.

When the Supreme Court ordered Commission jurisdiction over natural gas producers, gas was not paying its own way in the industry. The problem came to the forefront in 1948 when the Commission's *Natural Gas Investigation* established that gas was being wasted in enormous volumes, that it nevertheless had excellent value as a fuel, and that the most effective practice would be to establish a minimum price on sales of gas to pipelines in order to conserve the resource. It is paradoxical that, four years prior to its *First Phillips* decision, the Supreme Court should approve state-imposed minimum

wellhead prices for natural gas to the end that it would not be wasted. See *Cities Service Gas Co.* v. *Peerless Oil and Gas Co.*, 340 U.S. 179 (1950). This disparity between costs and past prices

is indicated by our opinion today.[3] If the analysis we utilize for new gas is applied to the average wellhead price for natural gas in 1947, the difference between the two is at least 2.4¢, with the average contract price being *below* the cost-plus figure. In 1947 gas sold at an average price of 6.0¢, but the Commission's present approach, if applied then, would have resulted in a price of 8.4¢. It was not until the late 1950's, according to the costs established today, that natural gas prices came to approximate the cost-plus rationale utilized by our opinion. Thus, the price rise of the 1950's resulted primarily from the gradual maturation of the natural gas industry into one where the product sold was paying a just return to the independent producer. Particularly anomalous, in view of allegations of "continuing inflation" of natural gas prices, is the fact that such an increased allowance to provide a return on investment and expenses is the least that should be accorded the producer as a result of his elevation to a "natural gas company" under the Act.

In addition to natural gas coming into its own, there were, in the main, four factors that led to increases. *First*,

[3] It is not possible to relate our present cost analysis in precise manner to past prices, primarily because of the absence of questionnaire data. Nevertheless, industry-wide statistics provide a meaningful basis for comparison.

the sudden rise in interstate demand necessitated, because of our regulatory standards, an equally sudden increase in reserve capacity with a concomitant market allocation to the higher usage. *Second,* the resultant of such demand was an activation of favored nation and spiral escalation clauses. *Third,* there was an extensive renegotiation of escalation clauses by pipelines in order to preclude such a repetition. *Fourth,* a competitive buyer's market existed temporarily when transmission companies entered new purchasing areas to negotiate contracts at prices somewhat above then extant market values. It is of special significance that wellhead increases occurred in the latter instance, particularly in the Permian Basin in the late 1950's, for it indicates that, without a competitive purchasing structure, producers are not able to achieve the higher prices. Thus, taking the average wellhead prices for the Permian in 1947 and 1956, the prices were 4.0¢ and 9.7¢ respectively, which are prices significantly less than the costs that have been established by this proceeding. By the rationale today utilized, this Commission could have established maximum prices of 7.2¢ and 12.5¢ in those two years, and the difference between the costs and what El Paso was then dictating amounts to prices some 30 per cent *below* the new gas ceiling that would have then been required.

277,721

Furthermore, it must be emphasized that there is absolutely no support, apart from a so-called "anarchic inflation" allegation discussed hereinafter, that trans-

mission companies, even though they possess superior bargaining leverage, are, because of an alleged ability to shift the costs without concern, indifferent to using this leverage. This accusation has been clearly refuted, not only by the published authorities cited earlier, but by the record before us. Witness Mayer, who has participated for over thirty-five years in the negotiation of sales contracts for Phillips Petroleum Company which is the largest independent producer of natural gas in the United States, and has been a supervisor in the sales division since 1945, testified as follows:[4]

> Q: Turning first to matters of general rebuttal, I direct your attention to the question of the Examiner occurring during cross-examination of Mr. Frazier at Tr. 231/27,003, lines 1-4, concerning the degree of bargaining between pipelines and producers existing in the past and present in the Permian Basin and ask you to state what your experience has been in this regard.
>
> A: I have been intimately involved in negotiations with the pipeline companies in the Permian Basin for nearly twenty years. *I have yet to see the time that the negotiator for the pipeline didn't drive as hard a bargain as he possibly could.* In my opinion, the pipelines have negotiated, and will continue to negotiate, for the purchase of gas in every way which will result in the greatest benefit to themselves and their customers.

This experience of the industry cannot, as a matter of record, be disputed. Significantly, the Examiner, although not fully persuaded on this matter for the entire period of the 1950's, was able to conclude as follows:

---

[4] Tr., pp. 28,138-139.

> . . . There is presently intense competition between pipelines for the limited growth in city-gate demand. And now that the city-gate price has advanced materially and distributors' costs have increased, competitive price pressures in the ultimates market have resulted in an added cost consciousness on the part of pipelines.

Since we are here fixing rates for the future, the circumstances with which we should be most concerned are reflected in the above conclusion.

277,722

Reliance need not be placed solely on the above. It is more significant that the rise in the price of natural gas can be fully explained, and that this rise has been part of a long-term picture that cannot be overlooked if there is to be a dispassionate analysis of the price-rise argument. The Bureau of Mines has compiled data in its *Minerals Yearbook* into charts that begin with 1940 or 1945. Such data have been used to emphasize the price rise. This limited survey is misleading because it overlooks the experience of wellhead prices over a twenty-year period prior thereto:[5]

[5] Record Exhibit No. 25, Schedule 2. See also Bureau of the Census, *Historical Statistics of the United States* (1960) and subsequent supplements.

(277,722)

Year	Price (¢ per Mcf)	Year	Price (¢ per Mcf)	Year	Price (¢ per Mcf)
1922	11.1	1935	5.8	1948	6.5
1923	10.0	1936	5.5	1949	6.3
1924	9.3	1937	5.1	1950	6.5
1925	9.4	1938	4.9	1951	7.3
1926	9.5	1939	4.9	1952	7.8
1927	8.8	1940	4.5	1953	9.2
1928	8.9	1941	4.9	1954	10.1
1929	8.2	1942	5.1	1955	10.4
1930	7.6	1943	5.2	1956	10.8
1931	7.0	1944	5.1	1957	11.3
1932	6.4	1945	4.9	1958	11.9
1933	6.2	1946	5.3	1959	12.9
1934	6.0	1947	6.0	1960	14.0

This complete presentation reflects the full scope of the price history of natural gas production: a germinal period of relatively high prices followed by successively declining periods which resulted in depressed prices that were extremely low; the low point was reached during wartime when price controls were imposed based on market conditions; and finally, there was a period of successive increases during the post-war period responsive to the increased demand. Significantly, these statistics establish that the moving average price in 1954, when federal producer regulation was imposed, was 1.0¢ lower than that of 1922, and

277,723

the oft-emphasized increase from 1950 to 1960 was but 0.9¢ greater than the seldom emphasized decrease from 1922-1940.

Even the increase from 1945-1960 must be placed in further perspective. Based on *Minerals Yearbook* statistics, the record exhibits reveal the explosive volumetric growth experienced by natural gas sales over the relevant period: in 1935, 1.92 trillion cubic feet; in 1940, 2.66 trillion cubic feet; in 1945, 3.92 trillion cubic feet; in 1950, 6.28 trillion cubic feet; in 1955, 9.41 trillion cubic feet; and, in 1963, 13.88 trillion cubic feet. During this period demand increased over 700 per cent. This growth, when considered with the circumstances that production rates of return on average total capitalization have declined steadily since 1951,[6] and that several large supply areas have developed from what were once considered doubtful prospects, conclusively establish that there is no substance to the proposition that extravagant producer returns resulted in unnecessary exploratory drilling activity during the relevant period. The activity of natural gas production is simply not susceptible to the same precision of cost-control that is possible in most manufacturing and retail operations. Ultimately, unproductive outlays will always be the price of flowing gas, just as flowing gas will always be the product of once doubtful expenditures.

Reflecting a remarkable demand explosion, the high desirability of natural gas as an energy source doubled its relative position in the energy fuels market. Gas supplied but 14.1 per cent of this market in 1946. This increased to 17.6 per cent in 1949, to 20.5 per cent in 1951, to 24.5 per cent in 1954, to 27.6 per cent in

[6] Respondent's Exhibit No. 220, Schedule 11.

1958, and to 29.4 per cent in 1960. While the 1946-1960 rate of growth for coal-lignite and liquid petroleum was a sluggish 2.4 and 4.7 per cent, respectively, natural gas experienced the rapid growth rate of 8.4 per cent.

The effect of this increasing demand on wellhead prices has been thus explained:[7]

> The sharp increase in field prices over the space of a year or so is undoubtedly responsible for much of the political support of price regulation for the industry. Such a rapid rise in prices is, of course, quite possibly compatible with the operation of a competitive market where consumption increases rapidly and where a part of the increase is in higher value uses, as has been shown to be the case in this industry. Total marketed production

> averaged 5.1 trillion cubic feet per year for the country as a whole in the period 1946-1950, compared with 8.8 trillion from 1953-1955, an increase of about 75 per cent, compared with the 86 and 93 per cent increases in price in [Texas Railroad District Number 4 and South Louisiana]. The relative price increases are not appreciably greater than the relative increase in consumption for the nation as a whole, and in these two areas marketed production was probably up more than the national total.

The increasing demand for interstate gas dictated that annual additions not only equal production, but that a reserve cushion also be added as a safety margin. As annual consumption increased, annual findings had to increase at a greater rate. Prices had to rise, not only to

[7] Cookenboo, *op. cit.*, p. 39.

meet rising costs, but also to finance the annual increase in capacity. In other words, prices had to more than recompense the previous investment in order to provide more than current production. The result was the classic reaction of a free market: prices rose, not only to increase capacity in response to demand, but also to limit that demand until deliverability had accelerated.

The price rise has had, and continues to have, two other highly desirable effects upon the disposition of natural gas: it curbed waste, and it deflected gas away from such inferior uses as carbon black production. The record portrays this quite distinct inverse relationship between price and waste:

Year	Average Wellhead Price Seven Southwestern States (¢ per Mcf) Constant (1947-1949) Purchasing Power	Wasted and Vented Seven Southwestern States Per Cent of Net Production
1946	4.1	24.7
1947	3.9	22.7
1948	4.3	15.7
1949	4.5	15.1
1950	4.7	12.2
1951	4.8	10.2
1952	5.6	10.0
1953	6.7	9.1
1954	7.4	7.7
1955	7.6	7.5
1956	7.7	7.6
1957	8.0	6.8
1958	8.7	5.1
1959	9.4	4.4
1960	10.1	4.2

The Bureau of Mines *Minerals Yearbooks* reveal the identical inverse relationship between price and less desirable uses:

Consumption Sources	1940	1945	1950	1955	1963
Residential	16.7	15.6	19.9	23.4	24.5
Commercial	5.1	5.9	6.4	6.4	8.7
Total	21.8	21.5	26.3	30.3	33.2
Oil Field	26.8	23.5	19.7	16.7	14.2
Carbon Black	13.9	11.0	6.8	2.7	.8
Refineries	4.8	8.7	7.6	6.9	5.4
Electric Utilities	6.9	8.4	10.4	12.7	14.6
Other Industrial	25.8	26.9	29.2	30.7	31.8
Total Industrial	78.2	78.5	73.7	69.6	66.8

In evaluating the advisability of placing primary reliance on field-negotiated prices, it is necessary to appreciate that the increase in wellhead prices was but a slight portion of the increase in burner tip prices, and that neither increase was inconsistent with contemporaneous trends. Witness Jordan's exhibit reflects the following relationship between wellhead and burner tip price increases:[8]

Year	Wellhead Prices	Average Value Residential Use	Wellhead Price as a Percent of Residential Value
1950	6.5	69.0	9.4
1951	7.3	76.0	9.6
1952	7.8	83.1	9.4
1953	9.2	86.5	10.6
1954	10.1	89.3	11.3
1955	10.4	88.7	11.7
1956	10.8	91.3	11.8

[8] Respondent's Exhibit No. 42.

Year	Wellhead Prices	Average Value Residential Use	Wellhead Price as a Percent of Residential Value
1957	11.3	93.0	12.2
1958	11.9	98.2	12.1
1959	12.9	101.1	12.8
1960	14.0	103.4	13.5
Increase			
1950-1955	3.9	19.7	19.8
1955-1960	3.6	14.7	24.5
1950-1960	7.5	34.4	21.8

The above clearly establishes that, while the years 1950-1955 saw a 3.9 cent increase in wellhead prices, they also saw a 19.7 cent increase in residential prices. The years 1955-1960 show a similar relationship: a 3.6 cent increase in wellhead prices and a 14.7 cent increase in residential prices. For the entire period, the relationship was 7.5 cents to 34.4 cents, revealing that residential price increases were the result not of wellhead price increases, but, among other things, of increases in the capital costs and expenses of transportation and distribution. The following nationwide figures are important:[9]

These charts are persuasive indicators that producers have not been the cause of "anarchic inflation". To the contrary, the legitimate costs of producing and delivering natural gas have necessarily resulted in price increases which must be borne to the end that a sufficient and assured quantity of gas is available for ultimate users throughout the Nation. Significantly, our opinion today establishes that costs have risen to rates that are no more than is required to provide natural gas service.

The price indices at production and consumption points for various fuels, and a comparison of production point fuel price increases to general indices is conclusive in the cumulative statistical presentation. The record reveals the following:[10]

These data reflect what has been too-lightly disregarded: that the rise in natural gas prices was not excessive in relation to the rise in interstate demand, the rise in wholesale price trends, the rise in price trends for competitive fuels, or the rise in average hourly earnings. They also reveal that criticism cast on the producer for residential price increases was 80 per cent misplaced, and accusations of extraordinary production returns were statistically unsupported. This overall picture is made clear by the chart on page 24. Rather than constituting a justification for rigid cost-plus regulation, the criticism is refuted by the extensive investigation and cross-examina-

tion that has occurred in this case. It must be concluded that natural gas has been earning no more than a fair return on its costs, and the absence of conclusive evidence to the contrary bolsters the presumption that the competitive factor in the field provides, within limitations, the necessary independent determinant to this Commission's regulatory responsibilities.

The absence of producer price-dictation in the Permian Basin

The early necessity for conservation laws in most states was a result of the ruinous competition that was possible in producing fields because of the law of capture. This era of active rivalry among producers is now past, but the opportunity for independent operation which led to state conservation regulation indicates the sense of independence that is common among the operators of producing properties. It is indeed fortunate that these early predatory practices have been eliminated. Furthermore, the prevention of drainage to protect correlative rights and the regulation of production to reflect market demand has not eliminated competition in other aspects of the companies' activities. The primary basis that leads to any presumption of a lack of competition has been the price rise. As discussed earlier, this has been no more than a reasonable rise responsive to high costs, and it was considerably less marked than the increases which resulted in other commodity-oriented industries.

Aside from the overwhelming concentration on costs by Staff and the California distributors, thorough con-

(277,729)

INDEX NUMBERS 1935-1939 = 100

732d

sideration of the competition issue has been clouded in a failure to make precise definitions. The problems of description and categorization result from the various meanings attached to the concept of competition. In my view competition means a buyer is free to purchase alternative sources of a product from relatively small sellers acting independently of each other.

However, in addition to the price rise emphasis, certain parties improperly assume monopolistic motivations. This assumption necessarily rests on the classical model of only two sellers of equal power; it thereby overlooks the environment in which enterprise operates: that of sellers of different size subject to a multitude of economic conditions, all of which combine to make any final price the subject of numerous considerations which regulators can at best estimate. More evidence is needed than a restricted competitive model. Consideration must be given to relative size, to numbers of companies, to ability to enter the market, to any business arrangements between various sellers and buyers, and to the countless other factors that make up a market. Of particular

significance to the producing industry are such special market conditions as acreage controls, flaring rules, and the prevention of lapse of the lease. The question is one of the power of a seller or group of sellers to dictate a price that is divorced from costs. This condition does not exist in the Permian Basin. It is clear that there is such a measure of effective competition that in future proceedings producers can be accorded a relative degree of independence to the end that contract prices determine the ceiling price we set for natural gas.

On the record before us, there is no evidence of monopolistic power possessed by producers in the Permian Basin. The issue, though properly raised by the producers, has gone unnoticed by the other parties. Respondents have met the burden of proof on the competition issue. Staff and the California intervenors have not. The state of the record is such that Respondents have made every possible showing of competition, and, further, they have shown that this competition is sufficient, under a majority of the contracts, to provide a meaningful methodology for determination of just and reasonable rates. It is no answer to say that the producing industry has not met its burden. The burden of proof is not solely on Respondents. Although this proceeding involves Section 4(e), filings, where the burden is expressly placed on producers, it is essentially a Section 5(a) proceeding in which our Staff must make the proper showing. Nevertheless, this case cannot turn on the burden of proof. There is sufficient evidence on all issues.

Furthermore, that this is a regulatory proceeding does not detract from thorough consideration of relevant economic evidence to ascertain whether producers exercise undue powers over price. Certainly there is no basis for a presumption that there is no competition. The ramifications of the order we issue today require comprehensive and meaningful treatment of this issue.

Briefly, the record shows that, of all producers in the Permian, 361 were named in the order initiating this proceeding, but no one of these sells over eight per cent of the gas produced on a national basis. In addition, at least 2,280 producers in the Permian Basin supply gas to processing plants under percentage contracts. In the aggregate, there were 54 producers in 1960 who sold over ten million Mcf of gas per year. In the Permian Basin there are 20 producers selling some 80% of the gas produced. These numbers and sizes necessarily raise the presumption that there is such a degree of self-interested rivalry and of independent action as to preclude a presumption of concerted action. On the other hand, there is not a scintilla of evidence that any of the producers have ever acted collusively; they have not exercised their power in a manner harmful to the competitive market. There has been no parallelism in prices to indicate action by any producers to

control price. This stands out clearly:[11]

Year	Company	Number of Contracts	Price Range
1953	El Paso Natural Gas	45	9.0¢-10.0¢
1954	El Paso Natural Gas	80	8.5¢-10.0¢
	Permian Basin Pipeline (Northern Natural Gas)	6	9.0¢-10.5¢
1955	El Paso Natural Gas	32	8.5¢-10.0¢
	Northern Natural Gas	2	9.5¢-15.0¢
1956	El Paso Natural Gas	47	7.5¢-10.0¢

[11] Respondent's Exhibit No. 25, Schedules 12 and 13.

Such a vast range in prices over the period of almost a decade certainly is suggestive of the fact that all producers, or even the major sellers do not exercise effective monopoly powers.

277,732

There is relative ease of entry into the business. Such discrimination as may exist comes, not from producers, but pipelines. Further, it must be emphasized that such factors as a rapid growth rate, excess capacity, and meeting the prices of a rival are conditions to be expected in a market that is rapidly expanding and coming into its own. The opening of markets and the high rate of technical progress usually characteristic of such a situation make for uncertainty as to the most profitable policies. Any uncertainty of prices under contracts, even when Transwestern broke El Paso's monopoly, reflects no more than unprecedented demand and not monopoly control by producers.

The sole non-competitive factor has been the long-term contract, required by this Commission as a condition precedent to certification. Early uncertainty as to the proper prices for natural gas and particularly its use as a waste product acerbated this twenty-year pricing policy by compelling producers to insist on various indefinite escalation clauses to the end that, once stable prices were realized at a level that returned costs to the producer, each seller would so benefit. These clauses have been negotiated in the Permian since at least 1945 when El Paso contracted with Phillips for a sale of gas

at 3.5¢ per Mcf, but subject to indefinite escalation based upon El Paso's resale rates at the California border. Since the middle of the last decade, such indefinite escalations have been uniformly condemned. The following comment is relevant:[12]

> Many witnesses appearing before the committee, particularly those representing distributing interests and consumer areas, maintained that escalation clauses in existing contracts, unless their operation is controlled in some effective manner, could result in very large increases in the cost of gas to consumers —
>
> **277,733**
>
> particularly in view of the fact that a contract for natural gas usually runs for 20 years or more, and a large proportion of the contracts presently in effect were entered into in recent years . . .
>
> It is provided . . . that where a rate increase is based on a price increase resulting from the operation of an escalation clause [except the so-called step-up and tax-increase clauses] in an existing contract the Commission may not consider as an operating expense for the purchase of such natural gas any part of the increase in price which results in a price in excess of the reasonable market price therefore.

We have endorsed the above recommendation by prohibiting the prospective operation of such clauses.[13] Our

[12] Report of the Committee on Interstate and Foreign Commerce; to amend the Natural Gas Act, as amended; House Report 992, p. 9 (84th Congress, 1st Session, 1955).

[13] See the *Pure Oil Company*, 25 FPC 383 (1961); Order Nos. 232 and 232-A, 25 FPC 379, 609 (1961), amending Sections 154.91(a) and 154.93 of the Commission's Regulations under the Natural Gas Act.

opinion today permits their further operation only to the extent they were negotiated in past periods and in any event such escalations cannot exceed the ceiling rates. Looking to the future the extensive impact of limited price increases in new contracts cannot approach the increases realized in the last decade. Thus, by this determination, there is a solution to the single factor that has compromised workable competition.

Finally, in determining the competition issue, it is relevant to consider an energy market broader than the natural gas industry of the Permian Basin. It is clear that natural gas is presently sold at a level competitive with other fuels and sources of energy. This is particularly the case on a national basis, and is the result of continuing economies in the coal and electric industries. If our analysis is expanded beyond the Permian to take cognizance of this national energy market, there is evidence of those conditions that would indicate restrictive economic forces. There are alternative energy sources to provide an independent

determinative of prices. The consumer's individual outlay does not restrict his freedom to select alternative sources; the energy market is in a state of equilibrium. For this reason, if no other, transmission companies cannot disregard the prices paid to producers, and, particularly for the future, it cannot be assumed that the pipelines do not have the same interest in their investment as the distributors have in their related investment.

Reliance on the price rise to justify a conclusion of producer price-dictation must falter in the face of overwhelming evidence that this rise was parallel to the rise in all other price indices, that the price rise reflected the elevation in the value of natural gas to a level that would return to the producer his reasonable costs, and that there is competition sufficient for our regulatory purposes. For these reasons, I rely upon the reasonable market prices in addition to the cost considerations in our decision.

JUST AND REASONABLE RATES BASED ON CONTRACTS

Far from undercutting our power to impose effective price ceilings, a price-demand approach would retain flexibility and would still present a direct relationship between cost considerations and the price ceiling. In view of the cost presentation herein, it appears that in the future reliance on competitive forces should be sufficient. The independent operation of substantial parts of the market will provide an average price accommodating to the mandate that controls be imposed upon prices for natural gas. To the extent possible, one part of an essentially joint product will be regulated in a manner responsive to the needs of both the industry and the consumer. So long as most producers can operate under a compulsory price ceiling, the supplies will be available, and by that ceiling the consumer will be protected from price escalations that are not acceptable. The question becomes one of methodology. Although it might be preferable to enact legislation to abandon any effort at

price control other than such reasonable restraints as might be imposed upon pipelines, such limited controls are not totally removed from a method that has proven successful in the last few years.

Relevance of our in-line pricing policies

Following the Supreme Court's mandate in *Atlantic Refining Company* v. *F.P.C.* (*CATCO*), 360 U.S. 378 (1959), the Commission has followed a course in Section 7 proceedings of fixing ceilings at reasonable rates relevant to the existing market. It has thereby centered its attention on the weighted average prices under contracts which provide for the sale of substantial volumes of natural gas in interstate commerce. Indefinite escalation provisions have been removed, and rate increase moratoria have been imposed. Attention has been directed to permanent and temporary certificates covering contract rates, and the Commission has strenuously resisted all attempts to interject cost presentations submitted on an individual company basis. It has thus been successful

in effectuating, simply, quickly, and with minimal disruption, what five years of agitation and uncertainty, fraught with numerous procedural disruptions, can scarcely improve upon: fixed rates that are sufficiently high to induce adequate reserve accretions and yet with provisions for rate increases that would be so gradual that any unpredictable economic disruption at the distribution end of the natural gas industry would be precluded. Al-

though the procedure was notably unrefined, it has likewise proven to be remarkably efficacious. The in-line procedure took the notable step of avoiding cost-plus producer regulation and thereby illustrated that a "sane, sensical, and effective" course to producer regulation was available. Significantly, it represented initial development of the policies we adopt today. Nevertheless, since in-line proceedings arise under Section 7, it is appropriate that there be a more thorough analysis of contract prices when consideration is given the standards of Sections 5(a) and 4(e). Thus, the Ninth Circuit has stated that the provisions of Section 7 for certificates of public convenience and necessity do "not mean that before certificating such a sale the Commission must determine that the proposed initial price is just and reasonable [by Section 5(a) and 4(e)]." *United Gas Improvement Co.* v. *F.P.C.*, 283 F.2d 817, 822 (9th Cir. 1961).

The record in this case provides substantial evidence that in the future we should perfect a system of producer regulation that considers costs, but relies on the competitive forces, which in themselves provide an independent determinant to prices apart from what producers might prefer to dictate. Thus, the logical focus of producer regulation on an area basis lies in the negotiated field contracts. They are executed under circumstances of market compulsion after full consideration by persons intimately associated with the industry of all the factors that a regulatory agency can only estimate. These contract prices provide a privately-litigated answer to the question of what rates will be necessary to get the gas out of the ground. Any meaningfull system of regula-

tion would appraise the level of these prices as determined by arm's length bargaining in a competitive market. The analysis should include intrastate prices for that market will provide useful information for comparative purposes. While it is to be expected that regulation will distort a competitive market, contracts continue to be negotiated above these ceilings, and in-line price conditions are refused by producers in favor of other markets. Finally, since costs now approximate revenues, it should follow that competitive prices would accordingly be in-line.

277,736

The focus on contracts would remain constant unless there were important departures in direct relation to current experiences and projections of production volumes, exploration and development expenditures, drilling success ratios, market demand reserve additions, and the general cost indicia of the national economy. Of these several economic indicia, the single most important one is the reserves added each year. This is the crucial measure of the ability of just and reasonable rates to elicit the necessary supply. For present purposes it is apparent that field negotiations have been successful in eliciting supply, and that no specific reserves to production ratio should be required. The other important economic indicia are exploration and development expenditures and drilling success ratios. Both are joint costs of the oil and gas industry, but substantial deviations of either over the long term will require corresponding rate adjustments. Necessarily, both relate to the supply

elicited. It is these relationships that can best assist us in a determination of whether regulatory controls are successful in meeting current and projected needs. If adequate reserves were being elicited, an uncomplicated, practical decision would be one which imposed a single ceiling approximating the initial price mode or median of new contracts. If additions were excessive, based on current ratios, the ceiling could be lowered to inhibit exploration and dedication of further volumes to interstate commerce. If additions were deficient, the single ceiling would be adjusted proportionately upward, and, if the reserve posture required even more drastic remedies, contract rates could be increased upward pursuant to Section 5(a) as construed in *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1956). Finally, if specific rates were unduly discriminatory or preferential in specific cases they could be adjusted within the purport of just and reasonable rates.

Such a policy could be implemented with a maximum of time and expense. The regulatory burden would be greatly relieved, and Federal expenses would concomitantly be reduced. Although an orderly conclusion of pending area rate cases is presently required, contracts should provide an expeditious basis for setting just and reasonable rates in all other producing areas. Ancillary benefits would follow as cost-plus thinking is de-emphasized. More meaningful reserve data would be obtained. Difficult allocations could be of more limited impact. Cost questionnaires, indicative of whether trends in wellhead prices were approximating general indices,

would be far more simple and consequently far less expensive to complete. Since prices would be established expeditiously, they would be maintained current without resort to figures and testimony that are five years old. This would be achieved in addition to our current policy, clearly the most consumer-conscious yet effected, of imposing increased limitations to maintain current prices with provisions for filing for moderate increases in accordance with market determinations and other general economic trends.

277,737

The Reasonable Market Prices:

Subject to these additional views on the course we should take in establishing just and reasonable area rates for the Permian Basin, I concur fully in the Commission's opinion. Our opinion establishes that profit-oriented costs and supply oriented contracts do not, in the aggregate, depart in any significant manner from each other. To the contrary, an analysis of market prices establishes that contracts have apparently approached costs for the natural gas industry in the Permian, and, for the past few years, have maintained a level close to the cost analysis we here adopt. This is a significant stabilization. Thereby, a market price has been established which provides a reasonable measure of the rate necessary to elicit supply. From the record in this proceeding, for the period with which we are concerned, the overwhelming volumes of gas-well gas are sold under new contracts at the weighted average price of approximately 16.5¢. Con-

sidering this close proximity of the contract average to composite costs, it is clear that, by either standard, the rates we prescribe for the Permian Basin are just and reasonable.

The record establishes that, for all filed contracts in a seven-year period before and after 1960, there was a range in prices from 2.15 to 18.0¢.[14] The weighted average price for these contracts, based on volume, was 14.20¢ for 1962. This price is based on the initial contract price, and it is not shown what adjustments, if any, were provided for quality, taxes, and other circumstances. These have a definite impact on the regulatory rate we must establish. More particularly, as of early 1962, approximately one-half of the volumes sold was at an upward range from 15.0¢ to 17.0¢. Under various periodic escalations this price could be increased, by the end of 1968, to a price ranging from 16.0¢ to 18.0¢, with the overwhelming volumes being sold at prices approaching 18.0¢. Since we here intend price control up to an earlier date, Respondent's contract testimony is commensurate with the just and reasonable rate for the period. Other testimony establishes that, for contracts dated subsequent to 1960 but prior to the middle of 1963, the base prices range from 9.0¢ to 17.0¢ for gas-well gas, with the larger volumes flowing at rates ranging from 15.5¢ to 17.0¢ with the largest volumes at 16.0¢.[15] Based upon this survey of base prices under contracts, some as reduced under certificate conditions and accepted

[14] Respondent's Exhibit No. 252.

[15] Staff's Exhibit No. 317A.

by producers, the 16.5¢ rate established by our cost analysis is clearly within the range of contract prices.

There are limitations in relying solely on the above evidence, primarily because various adjustments for deviations from the standards for pipeline gas are not necessarily reflected in the contract price for new gas-well gas. The weighted average contract price for gas-well gas is 14.76¢, apparently after certain proportionate adjustments to reflect deficiencies.[16] Among others, these deficiencies include excessive sulphur and hydrogen sulfide content, excessive water content, below

277,738

standard pressure, and excessive carbon dioxide in the gas. From the record it appears that the possible range for specific adjustments will be from three to five cents; however, for all adjustments that might be necessary, the reasonable amount of the average adjustment will be in a range of from 1.0¢ to 1.7¢.[17] Adding this adjustment to the average weighted price of 14.76¢ a ceiling is indicated of from 16.0¢ to just below 16.5¢. In accordance with a policy of rounding upward, this would mean that a price of 16.5¢ is the just and reasonable rate for new gas well gas.

---

[16] Staff's Exhibit No. 334.

[17] A precise adjustment for quality cannot be ascertained from the contract exhibits in this proceeding. The Examiner made a general determination that one cent would be appropriate. See Examiner's Decision, pp. 69-73. Subject to developments under the quality adjustment procedures, we establish, the range is presently appropriate.

(277,738)

Further analysis of the record evidence supports the above conclusion.[18] Since the contract prices must be considered in the light of the quality of gas sold, it appears clear that, of the limited volumes of gas sold at pipeline quality standards, the 16.5¢ rate is clearly in line. The highest price for new gas-well gas is 17.0¢, which was paid for an estimated annual volume of 2,126,400 Mcf under six rate schedules. All of this gas appears to meet pipeline quality standards, except for 180,000 Mcf of gas sold under one contract allowing a lower Btu content and containing no specification as to water content. A larger quantity of new gas-well gas was sold at 16.0¢ — 6,149,336 Mcf to El Paso, 9,751,680 Mcf to Transwestern, 2,444,772 Mcf to Northern, and 958,320 Mcf to West Texas Gathering Company. All contracts for sales to West Texas Gathering Company would allow delivery of "sour" gas. The 16.0¢ price might have been higher had the gas been required to be of pipeline quality. These contracts are silent with respect to water content. Contracts governing the 2,444,772 Mcf sold to Northern provided for a minimum Btu content ranging between 950 and 1,000 and had no provision with respect to water content. These contract provisions do not reveal the actual quality of gas delivered, but again it appears that the 16.0¢ price would probably have been higher for higher quality gas. It is indicated that a 16.0¢ price paid by Transwestern was negotiated despite variations in the quality of the gas. Some 420,000 Mcf sold under three contracts is subject

[18] Staff's Exhibit No. 334.

to contract provisions requiring that the gas meet all pipeline quality standards save that the contract is silent with respect to water. The actual water content of the gas delivered cannot be determined. The remainder of the gas appears to be below standard in either pressure or in hydrogen sulphide content. Some 1,108,000 Mcf of this gas may also be deficient in Btu content, and about 6,475,000 Mcf of this gas moves under contracts which provide no standard with respect to water. The El Paso contracts at 16.0¢ are uniform in fixing delivery pressure at 1,000 pounds but are silent on most of the other quality standards.

277,739

At the contract price of 15.0¢, estimated annual volumes of 8,433,048 Mcf of new gas-well gas were sold to El Paso and 2,007,324 Mcf to Northern. The 26 El Paso contracts at this level are, with two exceptions, silent as to water content. Eleven of them require pipeline standards with respect to sulphur and hydrogen sulphide. One is silent on this subject, and the remaining 14, totaling nearly 3.5 million Mcf, do not require pipeline standards with respect to sulphur. Pressure appears to be below pipeline standards in the case of the majority of the 15.0¢ gas sold to El Paso, and possible Btu content deficiencies are indicated with respect to about one-third of this gas. The three contracts at 15.0¢ for sale of new gas-well gas to Northern provide for pipeline quality standards in all respects save that no standard was provided with respect to water content. Again we have no

information as to the actual water content of the gas delivered. From the above it must be concluded that new gas-well gas delivered at prices below 15.0¢ is, from the record before us, deficient with respect to one or more quality standards.

Attention should be called to the fact that the prices set forth in this exhibit are not for all the market sales of gas in the Permian Basin Area. No information was included in this record as to particular non-jurisdictional sales although some attempt was made by the Staff to show that the average non-jurisdictional prices were lower than jurisdictional prices. I emphasize that such intrastate conditions of the market are relevant considerations to area pricing. Taking all these factors into consideration upon the evidence presented, it must be concluded that our price of 16.5¢ set for new gas-well gas is appropriate; therefore, a just and reasonable rate is established.

Despite the validity of the 15.5¢ base price (exclusive of State taxes) for new gas-well gas, it is not acceptable to the extent that there is not a full upward adjustment for high Btu content.

It is clear that the quality of a particular volume of natural gas has a definite impact on the value we should assign to that gas. Consumers are interested, not in Mcf's, but in the heating units derived therefrom. For variations from what is required to supply consumers adequate therms of gas, there should be proportionate adjustments. On the basis of the record before us it is a matter that is not readily susceptible to resolution, and,

to determine the full extent of the adjustments that might be necessary, we have ordered procedures for negotiation of these matters.

It appears that natural gas from the Permian Basin is generally deficient in many of the standards required for pipeline quality as we have proposed in R-200, noticed at 18 FR 2.60, 2.61 (1961). A large amount of sour gas is found, there are several fields with large amounts of carbon dioxide, and low pressures are common. These deficiencies are to be reflected in downward adjustments from our base prices. On the other hand,

277,740

Permian gas does have one quality — Btu content — that is apparently higher than is delivered to pipelines in other producing areas. I dissent from the anomalous position of requiring full downward adjustments for all quality deficiencies while denying to producers a right to obtain meaningful upward adjustment for the single quality standard that is above pipeline quality. I emphasize that this dual standard attacks the validity of our cost analysis since, absent proper upward adjustments, it is possible that producers will not recover their legitimate costs.

In our recent decision in *Texaco Inc.*, Opinion No. 464 (issued June 10, 1965), we determined that, for the Hugoton-Anadarko producing areas, 1000 Btu's was the standard for pipeline quality there. Significantly, we relied on the contract terms, although Staff had favored

a weighted average base of approximately 1020 Btu's. It is appropriate to adopt area standards, but this being an area proceeding, all relevant circumstances should be considered. It is far from clear that the area standard for new gas-well gas is at 1050 Btu's. The weighted average for new gas-well gas is 1042, but this average is derived by excluding carbon dioxide volumes; if the latter are included the weighted average is lowered to 1034 or lower. Furthermore, it should be noted that the weighted average for all gas flowing in 1960 appears to be at 1039 Btu's. If our attention is directed to the contract requirements of the pipelines, which is the standard for determining all the quality deficiencies, it is clear that the minimum required is 1000 Btu's or lower. The standard Btu provision imposed by the transmission companies for purposes of price adjustments or rejection is between 1000 and 950 Btu's, but the preponderance of the contracts requires 1000. The opinion is thereby left with an obvious gap of 50 Btu's by which producers are denied the benefits of the gas they sell. If we compare the area standard with the national standard, it is clearly at 1000 Btu's, as we have proposed in R-200. Finally, it appears that the 50 Btu gap is important solely to the California distributors as a result of the high Btu content in the gas delivered to them at the California border. The reasons for this high standard are not known; certainly no producer participated in the negotiations leading to these sales. Rather than approve a practice of unknown origin, I would rely on the uniform contract standard for the Permian area, for the Nation, and for our proposed R-200

to set an upward adjustment from 1000 Btu's for new gas-well gas.

There are major difficulties in basing regulation on contracts while adopting the directionality thesis. Under price-demand split-level pricing should be avoided. In addition, since the natural gas industry generates a large portion of its own capital, it thereby underwrites current exploration by the older production. Reinvestment is an accepted and necessary feature of the industry, and the revenues it receives must be a source of funds for continued and increased nationwide exploration and development. We can be assured that the needed gas will not be found unless we acknowledge a proper role to reinvestment. This conclusion is particularly compelling during a transition to effective just and reasonable rates. We must condition our determination today to developments under a two-price system. Directionality is presently acceptable as an exploratory device of the industry. Because of the variance in elasticity between casinghead gas and gas-well gas, price can be utilized as a device to elicit supply; however, such regulation must be premised on a two-price system to reflect

market conditions. In these circumstances, the selection of a dividing line between old and new production can be made. In view of the necessary role of reinvestment and of the long pendency of these proceedings, the division date should be drawn between the years when reinvestment was the sole reliance and when directionality had

begun to establish itself. Since this had occurred by 1960, I accordingly join in the division date for old and new gas. For the test year, the weighted average price for all flowing gas-well gas was below 14.5¢. Again, the record is deficient as to the quality of this gas. The record does establish that the weighted average revenues received for all gas-well gas flowing in 1960 was 13.05¢.[19] Applying an appropriate upward adjustment for quality deficiencies a price in the range of 14.0¢ to 14.5¢ is established. It is noted that this is a different standard for determining a price for old gas-well gas than for new. Nevertheless, it is an appropriate standard for determining a regulatory rate reflecting the price at which a majority of producers are able and willing to sell gas for a period encompassing several years during which costs were apparently being recovered. This is offset by the less demanding standard required for new gas-well gas to the end that an appropriate incentive is utilized. Further, the 14.5¢ ceiling applies to new casinghead gas and to residue gas from non-gas-well gas reservoirs. This reflects the relative inelasticity of those types of gas. Therefore, it can be concluded on the present record that the cost-plus rate of 14.5¢ for flowing gas is the just and reasonable rate, and I accordingly support the rate design prescribed. For future proceedings our opinion should lend support to this simpler and more realistic approach.

---

[19] Staff Exhibit No. 175, Schedule No. 1. It should be noted that the average initial price for gas-well gas sold in 1960 is 13.2¢. See Staff Exhibit No. 118.

It follows from my dissent as to the appropriate Btu standard that I also dissent from the determination to permit an upward Btu adjustment only for new gas-well gas. The fact that tremendous volumes of high Btu content gas are sold in residue gas, in casinghead gas, and in old gas-well gas is not considered, although our quality standards otherwise apply to all types of gas. I cannot condone this discriminatory determination. Upward Btu adjustment from a base of 1000 should be applied to all gas from the Permian Basin. I would note that the additional revenues to the producers as a result of the 1050 standard will apparently be so minimal as to be meaningless. The better course would be to avoid any standard pending developments under the quality adjustment procedures.

Although I believe a more complete discussion of just and reasonable market prices should have been added to supplement the reliance solely on cost-plus, I support the rationale in the main opinion. The cost analysis there employed is not only reasonable; more important, it is a feasible synthesis of the cost evidence before us. Such costs are most useful as a basis for comparison to the contract prices. Our proceeding has established a significant point: there is no substantial difference between market and costs in the Permian. Either method is presently permissible

for purposes of area ratemaking. Accordingly, with the single exception of the Btu standard, I join in the procedures recommended for applying and enforcing the prices determined here today.

Area Rate Proceeding Claude E. Aikman, *et al.* North Central Oil Corporation (Operator), *et al.*	*Docket Nos.* AR61-1 G-18466, *et al.* CI60-435, *et al.*

(Issued August 5, 1965)

ROSS, Commissioner, *concurring and dissenting on limited issue:*

The instant decision represents, in my opinion, a noteworthy advance toward the goal of effective producer regulation and one which, with but one exception, I fully support. In addition to the Examiner and the parties, we are indeed indebted to our Staff and our predecessors on the Commission for their ingenuity in suggesting the concept of the area approach and for beginning this case.

The decision properly recognizes that the basic purpose of the Commission's rate regulation is to assure for the consumers of this nation an adequate supply of gas at reasonable prices. In the course of developing a methodology to meet this objective the majority significantly expresses a flexible and receptive attitude towards

certain issues that were not adequately developed by the parties in this first attempt at area producer regulation, notably capitalization of E & D costs and the usefulness of econometric presentations. My principal purpose in writing this separate statement is to emphasize and focus attention on the changes forecast by the majority, and to suggest future potential refinements in both the methodology and basic data.

While the decision is essentially sound, there can be little dispute that the margin of error will be narrowed as more complete and meaningful data are made available. Surely regulators should not be expected to vouch for absolute accuracy of their predictions without comprehensive and comprehensible gas reserve information.

Since the advent of electronic computers, econometrics has become increasingly useful in many fields as a tool for analyzing complicated economic problems. For the first time in a proceeding before this Commission, an attempt was made to analyze and test the complex interaction of regulatory and market factors with the aid of such advanced statistical and mathematical techniques. The Staff's econometric studies, commonly referred to as the Wein model, were a commendable effort to clarify the supply-eliciting function of natural gas field prices. This is one of the strongly contested and critical issues in this proceeding. The producers, drawing mainly on an analogy with unregulated competitive markets, argued that higher gas prices will elicit larger supplies. The Staff, on the other hand, stressed the inherent limitation on the industry's ability to respond to change in gas prices.

According to the Staff's presentation, the economic determinants of future gas supply include not only the price of gas, which is being fixed in this proceeding, but also various other factors such as the determinants of market demand, the price of oil, and the success ratio in exploratory drilling.

One valuable feature of the Staff's studies is the attempt to identify and quantify both the direct incentive effect of price on exploratory activity and the indirect "feedback" effects on supply due to the price elasticity of gas demand under conditions of interfuel competition in the market place. These opposing effects, as well as the independent effect of oil prices on exploratory activity, cannot be assessed profitably in the abstract, i.e., by gut reaction, but should be quantified, if at all possible, in the interest of more informed regulation under the Natural Gas Act. An example of this questioning attitude is Staff's refusal to accept automatically the proposition that the supply-eliciting function of price in unregulated competitive markets, where price is the result of the push and pull of impersonal market forces, is duplicated in the gas producing industry.

In the long run, I am confident that such analyses will provide fresh insights into the behavior of natural gas supply. I am also confident that this modern economic tool, as it becomes better known, will be adopted by the industry for its own use. Inevitably, this will result in a better understanding of the industry both for the manager, the regulator and the consumer.

In view of the fact that directionality with a two price system has been accepted by the Commission, it is inappropriate for this reason alone to use the results of Staff's studies. Their usefulness in the context of this case has been to cause everyone to wonder about and question the heretofore unchallenged hypotheses of the petroleum industry. When better developed, I am sure the results will provide both a practical and *legal* foundation for better gas producer regulation. I am therefore looking forward to the continuing use and refinement of the application of econometric and other advanced analytical techniques to the difficult task of producer regulation in future proceedings. Surely we should strive for more objective evaluation of economic matters in contrast to relying on our "feel" in such situations.

In view of the basic approach adopted in the decision, the desirability of establishing future area rates in the context of a nation-wide proceeding — from both an economic and administrative standpoint — is strikingly confirmed. The price for new gas is based entirely on a nation-wide rationale and on nation-wide data. This same

basis is used to support the price determined for all other gas. As the decision concludes, the search for gas is conducted on a national basis. This is true not only with respect to producers but increasingly regarding the pipelines as well. The evaluation of location on price, the importance of which the decision affirms, can be determined much more effectively — if not exclusively — in

a proceeding which considers the interrelationships of the various areas of supply with the markets they serve.

From a purely administrative point of view, a nationwide proceeding is a practical necessity. This marks only the first area case, which covers three producing areas. At this time final decisions in the three pending area cases involving eight producing areas are far from imminent; yet a further consideration of Permian rates will be due in a relatively brief two and one-half years. At this rate of progress, a review of Southern Louisiana rates could be due even before the Hugoton-Anadarko cases are concluded. It is easy to see that the Commission could well become involved in the determination and redetermination of the rates for but a fraction of the producing areas in the country, and never complete the job of determining the rates for all of the producing areas. Either this will be the result, or the Commission as well as the industry and other interested parties will be required to add tremendously to their staffs.

Considering area rates within the framework of a national proceeding would also obviate the necessity of plowing the same old ground time and time and time again. Area proceedings involve substantial time and cost not only for the parties but also for the Commission and its staff. While separate area proceedings have advantages for the first couple of cases, the law of diminishing returns rapidly takes over.

Another aspect of our decision which is ripe for further consideration concerns a method of pricing new gas, com-

monly referred to as project accounting. This method visualizes a project consisting of the finding of a given volume of non-associated gas reserves by the drilling effort in a specific test year (e.g., 1960) and the subsequent production of that gas over an assumed depletion period. All necessary outlays to acquire the capital assets (i.e., the reserves), together with an appropriate return on the investment over its productive life, are assumed to be recovered through the revenues traceable to the initial investment. Cash production expenses related to the lifting of the gas to the wellhead are also estimated and added to the investment charges to arrive at a total cost per Mcf to be recouped on a unit-of-production basis over the depletion period. This cost model, which capitalizes all investment outlays relating to the acquisition of the asset and then

allows a return thereon during its period of commitment, requires what is sometimes called a "true yield". The a ceptable method of determining such a rate is an investor-demand type of study focusing on the "capital attraction" rate or the experienced cost of borrowing in the capital market. This is the rate of return standard that is commonly applied by the Commission in regulating natural gas pipelines and electric utilities.

This method can be compared with that employed by the Examiner and adopted by the Commission which is probably best characterized as a form of cross-section accounting. Under the latter method, the costs are esti-

mated for the volumes produced in a given year, assuming equal production from a universe of gas producing properties equally distributed by vintages (thus cross-cutting all vintage projects). Further, under a convention of accounting in the petroleum producing industry, but without logic in economic costing, the cost model of the distributors capitalizes only the costs directly associated with productive properties, which is only a portion of the total cash outlays made in acquisition of the reserves. Outlays for dry holes and other expenditures not directly associated with successful properties are presumed to be expensed in the year of outlay, rather than to be recovered in future years from the revenues of producing properties discovered in the course of a general exploratory effort. Thus, E & D expenses, not related to the production or output of the given year, are substituted for those E & D outlays of previous years which were incurred in connection with the successful exploratory efforts and recouped in the given year when the reserves are being produced. Cash production expense, depreciation, depletion, and amortization expenses, and a return on investment computed on a cross-section basis are also charged on a unit-of-production basis.

In selecting a cost model for new-gas well gas, consideration must be given to the fundamental character of the economic costing problem. Unit costs of production for any commodity or service can only be arrived at by a careful matching of all necessary inputs with the associated output. This matching must, because of the time value of money, adequately reflect the timing as well

as the cost of all inputs. Inputs allowed must strictly relate causally to the output and all such inputs, with their timing, must be fully represented. The project method of accounting meets this basic requirement. In contrast, the other method expenses the portion of the capital outlays which relates to unproductive properties as if they were current operating costs, even though that portion is inseparable, at the initial planning stage, from the successful E & D outlays. Such expensing practices can lead to a distortion of the investors' allowed return from revenues generated by the initial investment.

277,747

In addition, an ancillary benefit of the project method lies in the fact that the somewhat discomforting aspect of "Adjustment for Exploration in Excess of Production", which seems to charge current rate payers for additions to a company's capital assets, is avoided.

This costing approach of capitalizing unsuccessful as well as successful well costs has substantial support within the accounting profession. Arthur Andersen & Co. has enunciated this position clearly and forcefully:

> "The purpose of exploratory activity is to discover oil and gas reserves for future use. Discoveries, however, are unlikely without the incurrence of some exploration costs for unsuccessful ventures. Such costs are necessary in the search for and discovery of new deposits of oil and gas reserves. Exploration costs for unsuccessful ventures are as much a part of the cost of the oil and gas discovered and produced as are the direct costs of productive wells.

"Only a portion of the oil and gas reserves discovered is likely to be produced and sold in a given year. The matching of related costs and revenues logically requires that the portion of all costs, including exploration costs, applicable to the oil and gas currently produced be charged to expense in the period of production.

"Because of the hazardous and speculative nature of the oil and gas industry, most companies have expensed their exploration costs as incurred. This practice has ignored the real capital nature of these costs, and has resulted in financial statements that do not show the total cost of the oil and gas reserves or of the current production therefrom. When exploration costs are charged to expense as incurred, profits are reduced or losses are shown in the exploratory years, because a substantial portion of the costs then being charged off does not relate to the income of the current period but to the income to be derived from future production of oil or gas."[1]

In addition, an excerpt from *Asset Accounting*, by William A. Paton, 1952 edition (pages 440 and 441) states as follows:

"In developing a wasting asset the costs of all explorations may be capitalized, even if some specific operations don't pan out, as long as the program is being carried on in a reasonable manner in the light of prevailing standards and techniques.

277,748

In the development of an oil lease, for example, several dry holes may be dug for each operation that proves to be productive. In this situation the cost of

[1] *Accounting for Oil and Gas Exploration Costs*, Subject File OI 2220, Item 124, Arthur Andersen & Co., January 1963, page 4.

> the dry holes may be regarded as a part of the cost of the activities that resulted favorably; like the falsework used in the creation of a building they represent preliminary operations necessary to the end result."

It should be emphasized, however, that this is not an endless road as the previous source cautions.

> "This interpretation, of course, must not be pushed to the point of justifying as assets the cost of development operations not warranted in the first place or long continued without success." (Paton, *Asset Accounting*, Ibid.)

Thus, while it may be appropriate to capitalize those unsuccessful ventures which can be related to the finding of successful production, this should not be interpreted as a blank check for loading the rate base with any other costs which have no bearing on productive properties.

Despite the seeming advantages of the project cost model, the record in this proceeding contains a meager amount of evidence directed to estimating a true yield rate of return and relatively much more directed to finding a rate of return under the comparable earnings test which is employed in the cross-section accounting method. With some reluctance in view of the size of the record here, I nevertheless conclude that the evidence on the critical aspect of rate of return on a true yield basis is not adequate to support the use of this method in this case.

My sole exception to the decision relates to the date of division between new and old gas which the majority fix to be January 1, 1961. I dissent to that finding because

it is fundamentally inconsistent with the very basis of the two-price system adopted by the majority. This system was first advanced by witness Kahn and applied by Roseman. Implicit and explicit in their testimony, and as the majority emphasize, the purpose of the two-price system; the purpose of a higher price for new gas, is to provide the incentive to find necessary new reserves. It is a rate designed to encourage the finding of gas in the future, for the future.

The majority's decision repeatedly emphasizes this rationale:

277,749

> "*Looking to the future* we are establishing a pricing system that will encourage the industry to expand and perfect its ability to drill directionally so that revenues from gas consumers can increasingly be devoted to finding additional gas reserves." (p. 29) (emphasis added)
>
> "The incentive is built into the two-price system. *It provides a price for the future* related to current and future costs and payable only to producers who discover gas-well gas and dedicate their discoveries to the interstate market. (p. 29) (emphasis added)
>
> "If a one-price system were to be adopted, average historical costs — not the highest current costs — would necessarily serve as its foundation, and we have no assurance that such a price would elicit the investments at current cost levels which are needed to bring forth adequate new supplies of gas-well gas." (p. 30)
>
> ". . . if such a ceiling were fixed high enough to elicit new gas-well supplies it would result in windfall profits for all other gas and if fixed low enough

to reflect costs for old gas it would not assure adequate supplies for the future." (p. 30)

". . . bring forth needed gas supplies in the future and this fact supports our conclusion to fix a higher ceiling for new gas-well gas which will encourage exploration at deeper horizons directed toward finding gas." (p. 32)

"The separate price we fix herein for new gas-well gas in the Permian Basin should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies." (p. 32)

It requires no lengthy citations from Webster's dictionary for one to understand that incentive or encouragement relates to the future — not to the past. No matter how hard it tries, the Commission simply cannot incite or encourage a producer to find and dedicate gas to interstate commerce which he is already selling, has been selling for up to four and one-half years, and for which he would need a specific order from the Commission before being free to discontinue.

277,750

Insofar as the majority relies on the issuance of the Policy Statement, the decision strikes a sharp blow at a basic purpose of the Natural Gas Act and the regulatory process. This Statement was issued without notice, without hearing, without any opportunity whatsoever for interested parties to comment. Reliance on such a Statement, the basis of which is devoid of support in the record, is improper. This is especially true since the Statement itself recited:

> "It is anticipated that these differences in price levels will be reduced and eventually eliminated as subsequent experience brings about revisions in the prices in the various areas."

How ironic it must seem to the consumers of this nation that the opposite is true — that our "subsequent experience" is viewed in the light of the Policy Statement.

Looking to the future, it is easy to see that this approach will result in a crazy-quilt maze of old and new gas prices, depending on irrelevant factors such as the length of time required to try the case, and the particular test year used. Thus, "new" gas-well gas can be four and one-half years old in Permian; but in South Louisiana, assuming (but not predicting) a final decision in 1967, "new" gas-well gas will be nearly seven years old! This is some legacy.

Irrespective of how this aspect of the decision is viewed, it makes no sense. I therefore dissent to this aspect of the decision. In my view, the new gas price should relate to gas sold under contracts executed after the date of this decision.

In response to this position which was advanced by the California intervenors, the majority has no rebuttal. It simply states: "We believe, however, that the intervenors' argument proves too much . . . "

Lastly, in order to avoid any future misunderstanding, I wish to note my disagreement with the modifications of the Examiner's method of determining the old gas price as set out in the majority's decision.

In summary, this opinion is a beginning — albeit a good beginning — toward implementing our responsibilities to establish just and reasonable producer rates. I believe that with improvements, including those here suggested which the Commission indicates a willingness to consider, we will make further progress toward achieving a fair and effective system of producer regulation.

/s/ CHARLES R. ROSS
Charles R. Ross, Commissioner

277,751

Area Rate Proceeding Claude E. Aikman, *et al.* North Central Oil Corporation (Operator), *et al.*	*Docket Nos.* G-18466, *et al.* CI60-435, *et al.*

(Issued August 5, 1965)

BLACK, Commissioner, *Concurring:*

I join in today's historic decision but wish to express briefly my separate views with regard to the Commission's determination of rate of return.

In the final analysis the allowance for rate of return is a judgment consideration. With some reluctance I concur in the Commission's exercise of judgment that on the evidence before us 12% is not excessive. I do not feel, however, that the record strongly supports such a consideration.

Because of the great numbers of producers who are affected by our decision in this proceeding and in the area rate cases to follow, the importance of a careful rate of return determination cannot be over emphasized. Translated into terms of the price of Permian gas, the difference between Staff's recommended 9.5% and the Commission's 12% is about 1.5¢ per Mcf for both new gas-well gas and flowing gas. This means about $11 million *annually* to jurisdictional purchasers of Permian gas, or nearly $4.5 million for every percentage point of rate of return.

Serious deficiencies exist in the presentation both of respondents and of the staff on the rate of return question.

The Examiner's basis for adopting a 12% rate of return is equally unsatisfactory. It is based on the earnings experience of nine "highly successful" non-integrated companies whose sales represent only about 4.5% of all jurisdictional sales made in the Permian Basin. Of these nine companies (which in my view is a woefully inadequate number to constitute a representative sampling) only three producers are primarily responsible for bringing the earnings up to the 12% average. And of these three, two were the smallest of any of the exhibit companies. Their total 1960 United States pipeline sales were, respectively, 5.2 million Mcf and 3.2 million Mcf. Their Permian Basin sales were, similarly, but an infinitesimal part of the total. It is apparently conceded that the non-integrated producer is not typical of Permian Basin gas producers;

indeed, the conclusion is unavoidable. Respondents' witness stated on the record that the typical producer is the large integrated company, and that the non-integrated producers constitute a class that is constantly diminishing in number. It is inappropriate that they should have been separated out as the standard for employment of the comparable earnings test. They simply are not comparable.

The Commission avoids any discussion of the adequacy of the non-integrated producer as a basis for comparison and instead rests our case entirely on a discussion of the risks of natural gas production cast in the most general

terms. My colleagues employ as the starting point the rates of return allowed jurisdictional pipeline companies, which fall into the range between 6.0% and 6.5%, and then seek to establish that natural gas production is a riskier business than natural gas transmission. I agree; but the translation of this added risk in terms of percentage points of return on investment has only marginal support in the record and we should acknowledge this to be the fact.

The principal risk which characterizes the operations of the independent producer is, as the main opinion properly notes, the dry hole — or non-commercial well — risk. The Commission points out that we are allowing the recovery of dryhole and associated costs as operating expenses in determining the area price for gas, but goes on to observe that "the uncertainty whether productivity will meet the industry average nevertheless remains as a risk for *each individual producer* . . . ." We are not, of course, making rates on an individual basis. A return of 12% will not obviate the risk of each individual producer in the Permian Basin; nor for that matter will a 50% return. On the Commission's reasoning it could be argued that we would have to allow a rate of return which would cover the least successful operation in the area. A basic rationale of the area-pricing approach as noted more than once in the Commission's opinion is its inherent incentive to exploration. While individual producers may not, in fact, earn a given return on their investment, by the same token no individual producer is *restricted* to a particular return. Efficient, prudent man-

agement — or just plain good luck — can produce a return which in the context of individual company rate making would be termed vastly excessive. But under our approach such companies can keep the fruits of their good fortune.

277,753

We are making rates for the industry as a whole, and the Commission properly observes that "there is a degree of predictability to production operations as evidenced by the fact that the industry as a whole has maintained over extended periods a consistent record of new discoveries and added reserves."

The main opinion effectively disposes of the producers' case for a 16-18% rate of return, and I will not comment further. I do, however, wish to address myself briefly to Staff's approach, which was joined by the California distributor intervenors, with the hope that the records in future area proceedings will provide the Commission with guidance to decide the proper rate of return on a more informed basis.

Staff's evidence, related to over-all earnings experience on total capital, includes the following:

(1) A national group of 35 companies, including both integrated and non-integrated oil and gas producers accounting for some 60% of reported 1960 pipeline sales in the United States. The simple average earnings of this group for the years 1957-1961 amounted to 9.5%, the median 8.8% and the weighted average 9.3%.

(277,753)

(2) A selection of 31 companies in the Permian Basin (again including both integrated and non-integrated producers) selling 81% of all the gas sold in the Permian Basin in 1960. The same averaging techniques as applied to the national group produced returns of 9.5%, 8.9% and 9.3%, respectively.

Staff also made use of data published by financial institutions, notably the Chase Manhattan Bank and the First National City Bank of New York. The results (both for total manufacturing and for petroleum production and refining) are not markedly different than those produced by Staff's special studies. These statistics, together with information taken from the well-known *Fortune* magazine study of the 500 largest industrial companies, address themselves separately to a return on equity capital. Although today's Commission opinion does not speak in terms of a return on equity, it is nonetheless a traditional and important tool in arriving at a proper rate of return. Using Staff's selected integrated and non-integrated companies, an over-all rate of return of 12% translates into 13.5% return on equity, assuming an equity ratio of 85%.

277,754

Chase Manhattan's group of companies (including Staff's selection) for the entire period 1934-1961 earned 9.44% on average total capital and 10.46% on average equity capital. For the five-year period 1957-1961 earnings on average total capital were 9.56% and 10.44% on average equity capital.

The First National City Bank figures, which included data for a large number of companies representing total manufacturing and a substantial group (124 in 1961) of petroleum production and refining companies, show for the petroleum companies a return of 9.66% on equity for the entire period 1925-1961 and 10.88% for the five-year period 1957-1961.

The *Fortune* study discloses an average of the mean rates of profit on equity for the petroleum industry to have been 8.88% for the years 1957-1961.

I cite these figures, not in an attempt to establish that the Commission's rate of return determination is erroneous, because I recognize that these statistics are in many respects not comparable and are likely subject to a variety of infirmities which make them inappropriate for the Commission to rely heavily on. My purpose is to indicate my belief that an over-all rate of return allowance of 12% is very probably a generous one.

In my view the principal infirmity in Staff's approach is the assumption that the unallocated earnings of the integrated producers necessarily reflects the level of earnings and thus the appropriate rate of return for the separate function of their gas production departments. Staff's position that the non-production operations of the integrated producers are riskier than those of gas production rests largely on argument. While it is true that the far-flung and diverse operations of the large integrated producers may be at least as risky over all as the production of natural gas, the record does not affirmatively support such a conclusion.

The Commission opinion asserts that "integrated returns are relevant to the instant issue" but notes that "Without a departmental segregation of costs and revenues, it is impossible to calculate production department returns."

Whether such a segregation can be made on another record or whether some other reliable means can be devised more accurately to reflect the earnings of gas producers on their jurisdictional investment, I express no opinion. I

only emphasize my strong hope that the Commission's determination of rate of return will not be understood as some kind of immutable standard which we have developed in this pilot decision, or that it will discourage the vigorous and imaginative prosecution of the rate of return case in future area rate proceedings.

Perhaps the most important single reason for a liberal rate of return allowance in the Permian Basin is that the greater part of Permian gas is substantially below pipeline quality. The Commission has provided for downward price adjustments to reflect these quality differentials with the result that much of the gas sold will not command the ceiling prices we have established.[1] The very strong likelihood that the producers will continue

[1] It should be noted, of course, that our allowance of upward adjustments in price to reflect heat value in excess of 1,050 Btu's without a corresponding downward adjustment until Btu content falls below 1,000 undeniably constitutes something of an offset to the producers' risk.

to find large amounts of substandard gas is characterized by the main opinion as a risk factor, and I agree that it is appropriate to reflect this special risk in rate of return, which may well be sufficient to justify a return allowance of 12%.

With the reservations noted above, I expressly concur.

/s/ DAVID S. BLACK
David S. Black, Commissioner

APPENDIX A, AR61-1, *et al.*

PARTIES AND PROCEEDING CONSOLIDATED[1]

Part I

The order of December 23, 1960, made the following parties Respondents:

Abell, George T.
Ackers, D. E.
Ada Oil Co.
Adams & Ray
Aikman, Claud E.
Aldrich & Fullingim
Amerada Petroleum Corp.
American Trading & Production Corporation.
Anderson-Prichard Oil Corp. (now Union Texas Petroleum, A Division of Allied Chemical Corporation)
Antweil, Morris R.
Bayview Oil Corp.
Beach, Mrs. R. G.
Bell Petroleum Co.
Benedum-Trees Oil Co.
Bird, Ethel W.
Black, Henry Drilling Co., Inc.
Blackwood & Nichols Co.
Blackwood, F. G.
Blanco Oil Co.
Bond Oil Corp.
Bradley, Albert
British-American Oil Producing Co., The
Brown & Key, Inc.

[1] With names of record as of June 30, 1965.

(277,756)

Ard Drilling Co., The
Argo Oil Corporation (now The Atlantic Refining Company)
Ashland Oil & Refining Co.
Atlantic Refining Co., The
August, John J.
Aurora Gasoline Co.

Hanlon-Boyle, Inc.
Howard, Alvin H. & D. E. Vasser
Indian Royalty Company
Kerr-McGee Oil Industries, Inc.
Maracaibo Oil Exploration Corp.
Mosser, H. J.
Poff, H. Bryan
Ryan, Katherine
Snowden, James H.
Tela Corporation
Terrill, J. W.
Young, Marshall R.

277,762

Part III

The following proceedings involving proposed increases in rates were consolidated. Proceedings marked with "*" are consolidated only insofar as they pertain to the Permian Basin, New Mexico and Texas Railroad Commission Districts Nos. 7-C and 8 areas. Regarding proceedings marked with "**", there remains open the question of the contractual support of the respondents to make the increased rate filings. This question will be determined in Amerada Petroleum Corporation, *et al.*,

APPENDIX B, Docket Nos. AR61-1, et al.

The following discussion from the presiding examiner's initial decision, Appendix B, pages 84-85, is adopted by the Commission:

E. DRY HOLE COSTS

Roseman and Park divide dry hole costs on the basis of the relationship between successful oil and gas well footage averaged over a period of years. While this method might not be suitable for dealing with the dry hole costs of an individual company due to the variations in annual success ratios and productivity of successful drilling, as Respondent witness Porter showed, these variations tend to be minimized in the magnitude of the industry's total effort over a period of years. Therefore these witnesses' basic approach is sound on the industry level.

For the period 1955-60, Park determines the average annual dry hole footage and successful footage, separately for exploratory and developmental footage. This shows that 6.4 feet of dry holes were drilled for each successful exploratory foot, and 0.3 feet per successful developmental foot. These numbers are multiplied by the average annual gas footage, broken down between exploration and development, thus arriving at the total dry hole footage to be borne by gas well gas. The total is then multiplied by the JAS 1960 average cost per foot for dry holes. The result is divided by the average annual reserve additions of gas well gas to produce 1.56 cents per Mcf for dry holes. Park thus allocates dry hole costs

in proportion to the relationship between successful gas footage and total successful footage.

Roseman also divides his dry hole footage between gas and oil in proportion to successful gas and oil footage, separately for "wildcat"[3] and other footage. He derives a combined ratio of 0.898 feet of dry hole per successful gas well footage as the weighted average for the period 1951-61. (The corresponding ratio for Park for the period 1955-60 is 0.891.) Then he takes the cost per dry hole foot drilled from the Census for 1958 and after adjustment computes the cost per Mcf of dry holes drilled.

Roseman makes three adjustments to the dry hole foot cost figure of $8.91, the Census figure for 1958.

The Appendix figures show a decline of 3.5 percent in dry hole drilling costs from the peak year 1958 to 1960. For the reasons previously given, it is appropriate to adjust the 1958 Census level by the trend actually experienced by the constant sample of companies in the Appendix. This adjustment reduces the cost per dry hole foot to $8.60 per foot.

Roseman makes a second adjustment to take account of the fact that gas wells are typically deeper and therefore more expensive than oil wells. Using the *Oil and Gas Journal* figures which show drilling footage by depth and by well type, and Appendix data which shows the

[3] *World Oil*, on which Park and Roseman rely for allocating dry hole costs, provides a breakdown between "wildcat" and total drilling. It appears that the term exploratory as used here by Park corresponds to the term "wildcat" used in *World Oil*.

Appendix cost per foot for 1960 in the various depth ranges, he finds that the average cost per foot of dry holes allocated to gas was 12 percent greater than it would have been, if depth had been disregarded.

Again, analysis of the figures allocated to gas by Roseman on the basis of successful wells at various depth ranges, indicates that the footage allotted to gas is 4 percent less than if, disregarding depth ranges, the allocation were made simply on the ratio of total successful gas well to oil well footage. This

is a statistical indication that deeper wells tend to have a higher success ratio. The combination of the second and third adjustments, an increase in cost of 12 percent for greater depth and a reduction of 4 percent for greater success ratio, results in an upward adjustment of 8.28 percent.

The adjusted cost per foot figure is $9.31 per foot which produces a cost of 1.42 cents per Mcf.

Roseman's trended Census cost per foot is preferred to Park's JAS cost. The JAS sample average cost reflects the overrepresentation of large producers, their deeper than average drilling, and consequent higher than average cost per foot. Roseman's adjustments which reflect the effects of depth and success ratios for gas wells are sound refinements. For these reasons Roseman's estimate of 1.42 cents is accepted.

The following discussion from the presiding examiner's

initial decision, Appendix B, pages 80-83, is adopted by the Commission:

B. LEASE ACQUISITION COSTS

Park, Roseman and Sherwin estimate lease acquisition costs for gas well gas on the basis of the relationship between lease acquisition costs and successful well drilling costs.

Data on leasehold acquisition costs in relation to successful drilling costs are available from the Staff Appendices B and C, the *Joint Association Survey* and the Chase Manhattan Bank's *Annual Analysis of the Petroleum Industry 1961* (Chase). Ratios between leasehold acquisition costs and successful drilling costs cannot be computed from the Chase data alone because the Chase drilling costs include lease equipment costs which cannot be broken out. However, the Chase figures for lease acquisition costs are separate. Roseman used this data and related it to the trended Census drilling costs (the Chase-Census results). The ratios from the above sources are shown for recent years below.

There is difficulty in using the data on this subject.

1. Lease acquisitions vary considerably from year to year and are significantly influenced by Federal offshore lease sales at which large blocks are sold at irregular intervals, chiefly to large producers. As shown below, the expenditures for leaseholds by the small producers have been stable in relation to drilling costs, while the expenditures of the large producers have varied significantly. Given the variability in the ratios, it is desirable to consider the results

Ratio of lease acquisition costs to successful well costs (percent)

	JAS	Roseman	Staff summaries	
			Respondents Over 10 million	Respondents Under 10 million
	(1)	(2)	(3)	(4)

N.A. = Not available.

for a number of consecutive years. The JAS does not report any results for 1957 and 1958. The Chase-Census figures are available over a span of years and the Appendix data covers 1956-60.

* * *

To relate lease acquisitions to drilling cost, Roseman estimated drilling costs for oil and gas separately from the

Census for 1958 and trended these results on the basis of the Appendix A experienced costs from 1957-60. The per foot results for oil and gas were applied to the total footage drilled of oil and gas wells as reported in *World Oil*, to obtain the total drilling costs for each year. As previously discussed, trending the drilling data on the basis of the trends shown in the Appendix A is a sound method for determining trends in drilling costs. Trending the 1958 drilling costs downward increases the ratio of lease acquisition costs to drilling costs. Roseman then relates the industry wide lease acquisition data of the Chase analysis to the trended industry drilling costs. He considers the annual ratios from 1955-61 * *

and correctly found no trend. He then determines the weighted average ratio for the years 1957-60 to be 26.4 percent, which provides a representative sample of years in which lease acquisition costs were at high and low levels. Applying this percentage to his drilling cost of 2.88 cents per Mcf for successful gas wells, determined from the first step, yields 0.76 cents per Mcf.

Sherwin's estimate for the relationship between lease acquisition costs and successful well costs is in the range of 33 to 37 percent. He begins with the Appendix data which for the years 1956-60 average 42 percent for the large producers and 26 percent for the small producers. He also considers the lower estimates of JAS and Chase. JAS doesn't cover the years 1957 and 1958, which the other estimates show were the two lowest years in any of the series. It is evident from the preceding table that for all the years JAS is available 1955, 1956, 1959, 1960,

1961, its ratios are never more than two percentage points higher than the Chase-Census ratios.

Sherwin's major reliance is the Appendix data for the large producers. The ratios for these large producers are much higher than either the JAS or the Chase-Census ratios. The ratio of 67 percent for 1960 is 29 percentage points above the JAS figure for that year and 30 points above the Chase-Census ratio. This last variance is probably due in part to extensive purchases by large producers of offshore leases at the federal sales occurring that year. Such lease sales are in the main confined to large producers and their affiliates, and are generally in large amounts. These transactions are reflected to a greater degree in the Appendix results for the large producers than in the JAS or the Chase-Census results, because the national Appendix data underrepresent the small companies to a greater extent than the other two. Sherwin's upper limit of 37 percent is based in the main on an apparent trend in the results for the large Appendix producers for 1958, 1959 and 1960, 39 percent, 43 and 67 percent, respectively, although on other occasions he criticizes the use of Appendix data even for trending purposes. During this same period there is no trend in the ratios of the Appendix small producers. That three years is too short a period to establish a trend for this purpose is shown by the downward movement in 1961 for both the JAS and the Chase-Census ratios. In March 1962 there were large sales of offshore leases, and the 1962 data will probably reflect this, but the whole picture still indicates variability but no trend. Sherwin's estimate,

being based largely on the least representative data, is rejected.

277,785

Witness Park combines his estimate for lease acquisitions with that for lease facilities. He estimates that these two items should amount to 50 percent of his already determined drilling costs per Mcf. Park's estimate is based in large part on his judgment and experience as an official of Texaco. He considered the JAS average results for these items for the years when this survey was published and the 1956-60 Staff average results for all Appendix B producers. Both show a ratio of 59 percent for lease acquisition costs and lease production facilities in relation to drilling costs. Park first adjusts this percentage downward to reflect the fact that lease production facilities are more extensive on oil leases. He then adjusts the percentage upward to a lesser extent to take account of the fact that gas wells are more widely spaced and drain a greater acreage than oil wells. These two judgment adjustments resulted in a net downward adjustment to 50 percent, of which Park assigns 40 percent for lease acquisitions and 10 percent to lease production facilities.

Park's 40 percent figure is higher than the JAS average ratio. Moreover, as previously noted, the JAS was not published for the years which the Chase-Census and Appendix ratios indicate were the two lowest in their respective series, 1957 and 1958. And, as previously noted, the JAS average is probably too high because it is overweighted by large companies whose acquisition

costs are a higher proportion of well drilling costs than is true for the small companies. The average ratio for the years 1956-60 for all the Appendix B companies is 42 percent. The upward bias in the ratios resulting from the unrepresentativeness of Staff's companies has been discussed.

Park's upward adjustment is based on his experience that the spacing of gas wells is typically wider than for oil and therefore uses more acreage. He also gives his opinion that gas acreage is not correspondingly cheaper than oil acreage. He cites no study or data in support of his conclusion. He does not appear to have considered the relative values of oil or gas prospects. Park does not mention the factor that the drilling cost for gas wells is typically greater than for oil wells because of the greater depth of gas wells. This would tend to offset the effects in the relationship of possibly higher acquisition costs for gas acreage.

The record contains a single study which indicates that the cost of lease acquisitions for gas has not exceeded those for oil. In Schedule 7 of his Exhibit 224, Roseman relates the capital accounts for lease investment to the investment in lease and well equipment plus drilling cost for successful wells, classified by lease types. In other words he takes the gross historical investment in lease acquisitions for successful gas aid oil leases, and relates this amount to the corresponding gross historical investment in successful wells and lease equipment. The study shows that lease acquisition investment was 22 percent for gas leases and 20 percent for oil leases. There

is no dispute that lease facility costs on successful oil leases are generally considerably greater than on gas properties. Hence it is probable that if the ratios were limited to the capital accounts for lease acquisition and successful wells, excluding the lease facilities, they would show that the ratio for gas leases was the same as or lower than for oil leases. In any event, the study indicates that the ratio of investment in lease acquisitions to total investment for successful leases is not significantly greater for gas than for oil. This study covers productive leaseholds only. The witness concludes that this limitation doesn't affect the comparison. There is no reason to expect that the respective ratios for oil and gas leases would be changed if leaseholds which are acquired and never go into production were to be included.

There is no evidence that recent investment in gas or oil leases would change the above ratios.

While not conclusive, this study indicates that it is a reasonable hypothesis that the ratio of lease acquisition costs to drilling costs is not significantly different for gas than for oil leases.

It is concluded that Roseman's estimate based on the Chase-Census ratio furnishes the most reasonable estimate for lease acquisition costs. Applying Roseman's ratio to his drilling costs yields 0.76 cents.

277,786

An analysis of the percentages in the table at the bottom of page 2 of this appendix setting out ratios of lease

acquisition costs to successful well costs indicates additional grounds for supporting the presiding examiner's determination of lease acquisition costs. As the examiner noted, in each year for which JAS percentages are available they correspond closely to the Roseman percentages. In 1955 the two figures were the same; in 1956 the JAS figure was one percentage point higher; in 1959, 1960, and 1961 the JAS figure is higher by two percentage points. For 1957 and 1958 no JAS figures are available but the close correlation of the figures of JAS and Roseman for the years in which data is available would indicate that if JAS figures had been available for 1957 and 1958, they would have been close to the Roseman figures of 20 percent for 1957 and 23 percent for 1958. This would indicate than an average of the available JAS figures would be misleading and that a more representative average could be obtained by including figures for 1957 and 1958, based on the observed relationship to Roseman's figures. With this adjustment, the average of the JAS figures would be 28.5 percent, as compared with the 33 percent which is the average of JAS figures actually available. It seems clear therefore that the Roseman figures of 26.4 are not too low and we agree with the examiner that they should be accepted for the purpose of computing the lease acquisition cost.

APPENDIX C, Docket Nos. AR61-1, *et al.*

DETAILED ISSUES IN COMPUTING THE COST OF OLD GAS-WELL GAS

In this appendix we shall discuss in more detail several of the issues raised in connection with the historical cost of service determination of the cost for flowing gas at pages 78-89.

Gas-Well Gas Produced from Combination Leases

Basic to the determination of production costs for old gas-well gas is the question of which lease categories should be included in the determination of such costs. There is no controversy over the inclusion of leases covering dry gas as well as gas condensate with and without lease separation. An issue has been raised, however, with respect to the inclusion of the so-called "combination lease", a term used to classify leases producing, or capable of producing, from both oil and gas reservoirs.

In computing its composite cost of gas-well gas, the Staff included data relating to gas-well gas from the combination leases for both production costs and for its E&D allowance. The producers concur in Staff's method insofar as it relates to E&D but contend that data from combination leases should be excluded from consideration in the production expenses and investment costs of gas-well gas because they involve unnecessary and unreliable additional allocations. The examiner pointed out that large amounts of gas-well gas are produced from the

combination leases and that there are economies of joint operation which should be reflected in the costs.

Our decision to base the price of flowing gas upon the cost of gas-well gas was based in part on an effort to minimize the number and complexity of the necessary allocations. Furthermore, because the liquids represent a much smaller portion of the total in gas-well gas than in oil-well gas,

277,788

such a cost is less dependent on allocations and more nearly represents an objective cost for the gas. With this in mind we must observe that to compute the corresponding production expenses and investment costs attributable to gas-well gas on the combination leases will require two distinct stages of allocations. The first stage is to divide the combination lease costs between all gas and all liquids by the use of the relative cost method. This must be done for all gas-well gas. However, there must then be a further breakdown of the costs assigned to gas between dry gas, condensate gas, with and without lease separation, and casinghead gas. This is a complex process, involving allocation formulas which are necessarily subject to dispute. Only when this step is taken can costs related to gas-well gas from combination leases be computed. If combination leases are excluded from the compilation of production costs the more complex two-stage allocation is avoided.

To utilize the costs of combination leases in determining production costs would involve the additional allocations which we believed should be avoided and would

thus defeat a major purpose of limiting the cost to non-associated gas. There is nothing in the record to support the examiner's suggestion that somehow gas-well gas can be produced more economically on a combination lease. We believe the production expense and investment data for gas-well leases which cover some two-thirds of the gas-well gas produced in the area is fully representative of the costs for gas-well gas. Accordingly, combination leases will be excluded from the production cost computation of gas-well gas.

The use of combination leases in the computation of E&D, however, presents no further allocation problem. There are no E&D expenses directly associated with the combination leases. All that is needed to make the E&D computation are the volumes of liquid and gas produced from each type of well, and such volumes are available. Accordingly, we find that the data from the combination leases should be included in the calculation of E&D, which is consistent with the positions taken by both staff and respondents.

277,789

Allocation of Overheads

In addition to the costs directly associated with the producing leases there are certain costs which are incurred in connection with the producers' overall activities. These are corporate general costs and expenses, area and district costs and expenses, prepaid taxes and insurance, corporate general net investment, area and district net investment, and materials and supplies. Such overheads must first be allocated between operating functions (such

as production and E&D), then between lease types, and finally between the gas and liquid products. There is no controversy about the allocation between operating functions, which was performed in most instances by the reporting companies themselves. The specific issue concerning these overhead expenses is the allocation of such costs between the various types of leases.

The Staff allocated these overhead expenses to leases on the basis of direct lease costs and expenses, exclusive of DD&A (depreciation, depletion and amortization) for items which are expensed, and on the basis of relative gross investment in the leases for capital items and the materials and supplies. On the other hand the Major Producer Group would add DD&A to the direct lease cost and expenses as a basis for allocating the common, or overhead, expenses and would use net investment in the leases as the basis for allocating capital items and the materials and supplies.

The examiner adopted staff's methods of allocation, and we affirm the examiner's finding. First, as to the issue whether the overhead expenses should be spread over all of the direct expenses including DD&A, it is clear that they should not. Overhead expenses are largely supervisory expenses and have no bearing on DD&A, which are bookkeeping entries to reflect the use of the investment. They should be allocated on the basis of direct expenses being supervised, which are exclusive of DD&A.

The second question is whether to use gross or net investment as the basis for allocating capital items and materials and supplies, two of the items in the overhead

category. In allocating the common investment items, gross investment more closely reflects management supervision than net investment which is affected by the amount of gas or oil already produced. The same is true for materials and supplies because such expenses continue regardless of whether the investment has been reduced by depreciation and depletion. We shall, therefore, allocate these two items on the basis of gross investment.

277,790

Reinjected Volumes

An important question relating to the volumes used in computing the cost of flowing gas is the treatment of gas that is produced from the well, but is reinjected for the purpose of improving operating efficiency and increasing the recovery of liquids. If the reinjected volumes are included the effect is to reduce the unit cost of gas sold below what it would have been if costs were applied only to volumes sold, and the volumes produced but reinjected were disregarded. This is true because the same costs would be spread over a greater volume.

Respondents maintain that reinjection operations relate only to cash production expenses, and that except for these expenses all other costs should be computed on the basis of the volumes sold, which would be a smaller volume (and at higher cost) than if the total volume produced including the volumes subsequently reinjected were used. On the other hand staff maintains that all costs — cash productions cost, DD&A, return on investment

and exploration costs — should be applied to total volumes produced regardless of their disposition.

The use of total production volume, rather than sales volume, in computing the cost per Mcf assures that the share of total production costs related to the liquids derived from reinjected gas are in fact borne by liquids. For example, costs of recycling include investment in reinjection wells and other equipment, which should be borne by the liquids. In our opinion the use of production volumes, an approach which was adopted by the examiner, is the proper one. The cost of obtaining the liquids is not confined to the current expense of lifting, processing, and reinjecting the gas; all the other expenses, such as production investment and the like, are necessary as well. If they were not incurred, there would be no gas to recycle for the benefit of the liquids.

The conclusion is in accord with our prior decision on this issue in *H. L. Hunt, et al.*, 28 FPC 897 (1962). In that case the Commission stated that production volumes rather than sales volumes should be used in cost computation, and specifically mentioned recycled gas as included in production volumes.

277,791

* * * For example gas that is recycled, gas used for off-lease purposes, gas used by other departments in drilling or production, and gas shifted to company gathering systems or plants all represent situations in which substantial volumes of gas may have been produced but would not be included in sales volumes.

The overstatement of the unit cost of single product gas inherent in the use of sales volumes also distorts the allocation of joint product costs. For example it is obvious that under the relative cost method too much of the joint production costs will be allocated to gas if the production cost of gas-well gas has been overstated. [.902]

Application of Relative Cost Method

A. *General Approach*

As a preliminary matter we are confronted with a dispute over methodology. Phillips' Witness Cramer presented a variant of the relative cost method which has been referred to as the "Y" Ratio method. The relative cost method relies on an allocation ratio based on single product costs, but the "Y" Ratio method includes in its base the costs and production of joint products, which are the very costs to be allocated by the ratio to be derived.

The "Y" Ratio method requires the use of a cubic equation and results in a mathematical formulation that is solved with a computer. Complicated formulas, even mathematical ones, do not necessarily produce meaningful results. We are persuaded that the method proposed by Witness Cramer creates only an illusion of precision and is less meaningful than the relative cost method of allocation. Under these circumstances we agree with the examiner that no reason has been shown to adopt this method.

In applying the relative-cost method there are three detailed issues on which staff and the producer-respondents differ. One is whether gas condensate leases should be included in the gas leg, a second is whether shut-in

leases should be included in the oil and gas legs, and the third is whether the joint products should be allocated on the basis of gross investment rather than on the basis of net investment.

277,792

B. *Gas Condensate Leases*

The Staff in deriving a gas leg added to the dry gas leases, the gas-condensate leases without lease separation but excluded the gas-condensate where lease separation occurred. Respondents argue that all condensate gas, both where lease separation took place and where it did not, should be included in the gas leg. In support of their position respondents urge that there is no difference from an operating and well investment standpoint between gas condensate leases and the dry gas leases which were included, and that all the gas condensate leases should be included to reflect representative conditions relating to production on joint product leases, because otherwise the gas leg is too small to be representative.

Essentially the respondents argue that all gas condensate production should be included in the gas leg because gas condensate and dry gas leases are similar. Their argument misses the point. Obviously if there is sufficient dry gas to provide a representative gas leg, no gas condensate at all should be added. If not, the issue is the extent to which gas-condensate lease types need be added to achieve representative conditions.

Producers responding to the Commission questionnaire for the major producers (Appendix B) produced

41,652,569 Mcf of dry gas in the Permian Basin in 1960, about 4 percent of their total gas production in that area. In computing the Permian Basin gas leg of such producers, staff added to this dry gas production 1,271,495 Mcf of gas-condensate gas produced by them from leases without lease separation.

In the past, in cases dealing with individual companies, the Commission has considered that a dry gas leg representing as little as 4 percent of the total gas production of a company was an inadequate sample, and has indicated that there should be added to the gas leg a portion of the gas condensate production for the purpose of obtaining a larger sample. *H. L. Hunt, et al., supra; Hunt Oil Company, et al., supra; Union Producing Co., et al., supra.* In none of these cases, however, did the amount of dry gas production approach

the 41,652,569 Mcf of dry gas which would be the sample here if the gas leg were restricted to dry gas. Also, in the three cases cited, we were dealing with the nationwide production of individual companies and the only practicable method of enlarging the sample was to depart from a strictly single product leg and include a portion of the company's gas condensate production. In the present proceeding, however, if it were determined that the 41,652,569 Mcf of dry gas produced by the major producers in the Permian Basin were an inadequate sample it would still be possible to maintain an all dry gas leg by using the national production of dry gas by the same

companies. Although the nationwide production of dry gas by these companies is only approximately 13 percent of their total gas production, it amounts to 862,395,237 Mcf annually, a production several times larger than all of that used in computing the gas leg in *Phillips Petroleum Company, supra,* (226,681,178 Mcf). There is no question that the 862,395,237 Mcf is a sufficient volume for an adequate sample.

The total costs allocated to gas by the relative cost method vary only in a negligible amount, whether national production or Permian Basin production of dry gas is used as the sample. The Staff's inclusion of gas condensate without lease separation also has little effect. The computations of production costs are as follows:

Type of gas leg used	Gas-well gas Costs in Cents per Mcf (at 12% rate of return)
Nationwide Dry Gas Production[1]	9.136
Permian Basin Dry Gas Production	9.157
Permian Basin Dry Gas + Gas Condensate Without Lease Separation	9.161

[1] This computation has been made using Permian Basin cost data but applying an allocation ratio derived from national statistics. We reassert that for flowing gas the area costs are to be used in computing production costs. The use of the national dry gas volumes would be for the sole purpose of developing allocation ratios.

It will be noted that the costs, as computed on the basis of an allocation ratio derived from national production, differ by approximately .02 cent per Mcf from the compu-

tation of such costs derived from the ratio of dry gas production in the Permian Basin, and that the ratio derived from Permian Basin production is more favorable to the producer-respondents. The computation actually used by the Staff, which included gas condensate without lease separation in determining the allocation ratio, varies from the determination made on the basis of the Permian dry gas only by approximately .004 cent, and, again, the miniscule difference is favorable to the producer-respondents.

We think that if there is an insufficient area dry gas leg the use of national dry gas production would be preferable to the inclusion of gas condensate production for the purpose of determining the allocation ratio. However, where an area gas leg is derived from dry gas volumes of 41,652,569 and where the use of national dry gas production would produce a result equivalent to use of the area dry gas production, we believe it is proper to use the area production leg. Since the inclusion in the gas leg of the small amount of gas condensate by staff resulted in such an insignificant difference in cost, for the purposes of this case we will adopt Staff's computation. Regardless of which of these two computations we choose, it would not alter the cost sufficiently to affect the price of old gas-well gas as herein determined.

C. *Shut-in Leases*

Staff in computing its gas leg and oil leg excluded shut-in leases for purposes of determining the allocation percentages, although the actual cost of the shut-in leases in the joint lease category is, of course, included in the

joint cost when the allocations are applied. Respondent-producers contend that shut-in leases should be included in determining the allocation percentages, because they are part of the cost of producing gas and shut-in oil leases are part of the cost of producing oil. The issue has been previously determined by this Commission. "Non-producing properties should not be included in ascertaining the oil and gas legs for allocation of the joint production costs." *Hunt Oil Co., et al.*, 28 FPC 623, 624 (1962). Shut-in lease costs are not representative of the production costs of either gas wells or oil wells because they are essentially non-producers. Their inclusion in the oil and gas legs would distort an otherwise representative single product cost factor and thus defeat the underlying principle behind the relative cost allocation method.

277,795

D. *Gross or Net Investment*

In computing the gas leg and oil leg for determining the relative cost of the joint production, the separate costs of each product must include an element of return on investment. Rather than using net investment, Staff would allocate the return allowance on the joint production on the basis of gross investment in leases producing separate single products. Respondents would use net investment. They argue that the use of gross investment overlooks the fact that this particular use of the relative cost theory is applied to production investment for the sole purpose of computing a return on investment, and

that such return is computed on net investment, not gross investment.

The fact that the purpose of the allocation is to compute a return on investment is irrelevant, the test being which method more nearly reflects the operating facts of the joint production. The basic fact which raises the issue between gross and net investment is that oil-only leases are generally more depleted than dry gas leases.[2] Thus, using net investment would tend to assign less cost to oil and more to gas than if gross investment is used. On joint product leases (except some combination leases), the depletion rate is the same for liquids as for gas. Allocation on the basis of the gross investment more nearly reflects that fact. If net investment is used as the basis for the allocation it would impose a comparatively greater burden on gas than oil because of the relatively lower net investment of the oil-only leases which are more depleted. Its use would not reflect the true state of affairs on many joint product leases. We shall, therefore, use gross investment for this allocation.

277,796

Lease Play Allowance

In our calculation of working capital for new gas, we included an additional allowance for lease play over and above the working capital allowance which would be

[2] Oil leases average 62 percent depletion, nationally, and 55 percent in the Permian Basin, contrasted with an average depletion for dry gas leases of 40 percent nationally and 37 percent in the Permian Basin.

justified under the traditional utility method.[3] The question arises as to whether this additional allowance should be permitted in the cost computation for flowing gas. In *Hunt Oil Company*, 28 FPC 623 (1962) and in *Union Producing Company*, 31 FPC 41 (1963) the Commission denied lease play allowances on the ground that since a year-end rate base was being utilized such an allowance was unwarranted. The rationale for this finding was that any money expended to obtain leases during the year would receive a full year's return, even though such properties may have been purchased late in the year. These cases were not precedents for excluding a lease play allowance under our new gas calculation since an average-year rate base and not a year-end rate base was being used. However, in the development of our composite cost of service for flowing gas, we are using a year-end rate base. Accordingly, in view of the findings made in the *Union Producing* and *Hunt* cases no additional allowance for lease plays is included in the cost calculation for flowing gas.

[3] In our computation of the new gas cost, there is a separate classification for working capital. In the development of a composite cost of service the working capital allowance is not set out separately but is combined with investment in property under the separate cost computation for production cost and E&D cost.

Computation of E&D Allowance

The Commission utilized the modified Btu method in allocating E&D costs. In its application of this method the Commission used an economic factor of 3.5 for lease liquids and 1.0 for all gas. The E&D costs related to the Appendix "B" respondents are set out on the following page of this appendix. The results are summarized below.

E&D Allocated to Gas-Well Gas

	Cost (Return at 12%)	Unit Cost (Return at 12%) ¢ per Mcf
Expense	$167,036,961	3.46¢
Return[4]	30,010,322	0.62
	$197,047,283	4.08¢

[4] In the costing of old gas, certain costs classified as E&D costs are "capitalized" and made part of an E&D rate base, while certain items are "expensed." In deriving the cost of new gas, no items except "expensed" items were classified as E&D, and, therefore, no separate E&D rate base was developed. All new gas cost items which were capitalized, regardless of whether they were applicable to E&D or production, were put into the production investment rate base. This distinction between old and new gas is one of accounting classification. The final cost computation under either method is not affected by this difference.

NOTE:
THE TERMS HEREIN ARE THOSE USED IN THE OPINION OF THE FEDERAL POWER COMMISSION IN PERMIAN BASIN AREA RATE PROCEEDING, AR61-1. NEW GAS-WELL GAS IS NATURAL GAS DERIVED FROM GAS WELLS MOVING UNDER CONTRACTS DATED ON OR AFTER JANUARY 1, 1961. THE BURDEN IS UPON A PRODUCER TO ESTABLISH THAT PARTICULAR GAS IS NEW GAS-WELL GAS OR RESIDUE GAS DERIVED THEREFROM, AND ALSO TO ESTABLISH THE PERCENTAGE OF SUCH GAS PRESENT IN A SALE OF MIXED GAS.

* Btu price adjustment to be applied in case of new gas well gas only.

APPLICATION FOR SMALL PRODUCER CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Section 157.40 of Regulations)

NOTE: Independent Producers of natural gas whose total jurisdictional sales on a nationwide basis for the preceding year, combined with those of " affiliated producers, " were not in excess of 10,000,000 Mcf may file the information called for in the following format (in four copies, to the Federal Power Commission, Washington D.C., 20426.) Include volume of gas paid for but not taken under prepayment clauses or otherwise, and volumes of gas sold under other independent producer rate schedules in the proportion that the independent producer seeking to come with Section 157.40 has an interest in such sales. Do not include sales made pursuant to percentage sales contracts. If insufficient space is given for a complete answer, continue the answer on the reverse side, noting the relevant number.

	Docket Nos.
Area Rate Proceeding	AR61-1, *et al.*
North Central Oil Corporation (Operator), *et al.*	CI60-435
Socony Mobil Oil Company, Inc.	CI61-34
Robert T. Brown (Operator), *et al.*	CI61-733
Texaco Inc.	CI61-879

ORDER ISSUING CERTIFICATES
(Issued August 5, 1965)

By Opinion No. 468 and order in this proceeding issued concurrently with this order we have prescribed the just and reasonable rates for jurisdictional sales of natural gas in the Permian Basin area. There are four applications for certificates of public convenience and necessity which were consolidated in this proceeding and these are the subject of the present order. Temporary certificates have been granted to all four applicants and the gas is now flowing in interstate commerce.

The only issue presented by the applications is the initial price at which the gas is to be certificated. As we stated in Opinion No. 468, the just and reasonable area rate fixed therein constitutes the "in line" price required

by the public convenience and necessity in granting permanent certificates. All of the applications involve "flowing gas" as defined in Opinion No. 468, produced in Texas. The applicable area rate is 14.5 cents per Mcf at 14.65 psia adjusted to reflect any quality deficiencies in the gas and we shall therefore grant the certificates conditioned to an initial price no higher than the applicable area rates. The certificates shall be subject to the moratorium on any rate increase filing in excess of the applicable area rate prior to January 1, 1968, as provided in Opinion No. 468, pp. 107-113.

277,802

Each of the certificate applications has a somewhat different history from the others and also differs in its contract provisions. We shall therefore discuss each of them separately.

The proposed rate schedule of *North Central Oil Company* (Operator), *et al.*, Docket No. CI60-435, contains provisions specifying that the gas must equal or exceed in every particular the pipeline quality standards established in Opinion No. 468. A permanent certificate will therefore be issued in this docket providing for an initial price of 14.5 cents per Mcf at 14.65 psia. The temporary certificate contained no refund condition but a rate increase was filed during the period of the temporary. The increased rate was suspended pursuant to Section 4(e) and has subsequently been collected subject to refund, Docket No. RI65-288. The last-mentioned docket has not been consolidated herein and accordingly the question of refunds in that proceeding will be disposed of

pursuant to the Order to Show Cause issued this date. The question of whether refunds should be ordered during the period of the temporary when no express refund obligation was operative, but prior to the effective date of the proposed increased rate, will be deferred until our decision of the same issue in Skelly[1] and Amerada[2].

Robert T. Brown (Operator), et al., Docket No. CI61-733 involves sales made under a temporary certificate without an express refund condition. The related contract contains provisions requiring gas moving under it to equal or exceed pipeline quality standards in all respects save for hydrogen sulphide and total sulphur. The permanent

certificate will provide for an initial price computed by modifying the ceiling price of 14.5 cents per Mcf by deducting therefrom the cost of processing the gas to meet the pipeline quality standards for the Permian Basin. Accordingly the producer (unless these sales qualify as small producer sales as defined in the rule proposed this date providing for small producer certificates for such sales) shall, within 90 days of the effective date of this order, file a statement which shall state either that the gas accords with all pipeline quality standards established in Opinion No. 468 or in which respects the gas deviates from such standards, the agreed cost to the buyer of processing the gas to bring it to the quality standards with

[1] Skelly Oil Company, Docket Nos. G-18638, *et al.*

[2] Amerada Petroleum Corporation, *et al.*, Docket Nos. CI62-1544, *et al.*

respect to each quality defect, and the resulting rate for the gas. Such statement shall be signed by both seller and buyer. However, if the seller and buyer are unable to agree upon any or all of the particulars entering into the computation of the proper price, the seller must so indicate in the statement and supply the information required to compute the applicable area rate as adjusted as well as the contentions of the parties with respect to the quality and amount of the adjustment as any item in dispute. The buyer may file a separate statement setting forth its views within such period. In such event the Commission will then determine the amount of the quality deduction. As in the case of *North Central Oil Corporation (Operator) et al., supra,* the determination of any refunds which may be due for the period of the temporary, when no express refund conditions were in effect, shall be deferred.

The applications of *Socony Mobil Oil Company, Inc.,* (Socony), Docket No. CI61-34, and *Texaco Inc.,* Docket No. CI61-879, involve so-called Spraberry or El Paso contracts. In accordance with the principles established in Opinion No. 468, the applicable area rate will be applied to the volumes of residue gas taken into the purchaser's pipeline under these contracts. The contracts provide that there shall be a reduction in the price paid for such residue gas if treatment of the casinghead stream received by the buyer is necessary to remove sulphur. The cost of such treatment and the cost of any other necessary treatment of the casinghead stream to bring the gas to pipeline quality, aside from those processing costs incurred in removing the liquids, must be deducted

from the ceiling price of 14.5 cents per Mcf to determine the applicable area rate. The certificates granted in these two dockets will be conditioned upon a filing by the producer within 90 days of the effective date of this order of a statement as to quality of the casinghead gas and cost

of treating (or an estimate if no agreement is reached) as described above and further conditioned upon an initial price equal to the applicable rate established by deduction from 14.5 cents per Mcf of the cost of treating the gas to pipeline quality standards as such cost is determined by agreement of the parties or by the Commission. During the time they were operating under these temporary certificates both Socony and Texaco Inc. filed for rate increases which were suspended and are now in effect subject to refund. Computations of the refunds due for the period during which these rates have been collected subject to refund will be dealt with in the Section 4(e) proceedings—Docket Nos. RI65-209 and RI65-115.

Socony succeeded to a temporary certificate which contained a refund condition. Texaco Inc. succeeded to a temporary certificate without refund condition. Accordingly, Socony will be required to submit a computation of all excess amounts collected for the entire period of operations under the temporary certificate except the time during which the Section 4(e) proceeding was pending, and to make refund of those amounts with interest. For the reasons previously stated, Texaco Inc. will not be required at this time to make any refunds for the period when there was no express refund condition.

All certificates issued herein shall be subject to a moratorium against rate increases prior to January 1, 1968, unless such increases are authorized by later order of the Commission.

The Commission finds:

(1) Each applicant for a certificate of public convenience and necessity listed in Appendix A hereto is a natural-gas company within the meaning of the Natural Gas Act as an independent producer of natural gas, as that term is defined in section 154.91(a) of the Commission's Regulations, engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption and such sales together with the construction and operation of any facilities therefor are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(2) Each applicant listed in Appendix A hereto is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

277,805

(3) The sale of natural gas as proposed herein by each applicant listed in Appendix A hereto together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor are required by the public convenience and necessity and a certificate authorizing the same should issue to each of them upon the terms and conditions of the order herein,

which terms and conditions are required by the public convenience and necessity.

(4) Except as granted in the order in Opinion No. 468 the exceptions of the applicants listed in Appendix A hereto to the presiding examiner's initial decision and proposed order should be denied.

The Commission orders:

(A) Certificates of public convenience and necessity are issued, upon the terms and conditions of this order, authorizing the sales by the applicants listed in Appendix A to this opinion of natural gas in interstate commerce for resale, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary for such sales, all as hereinbefore described and as more fully described in the respective applications, amendments, supplements and exhibits in this proceeding.

(B) The certificates granted in paragraph (A) above are not transferable and shall be effective only so long as the applicants continue the acts or operations hereby authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations and orders of the Commission.

(C) The grant of the certificates issued in paragraph (A) above shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act or Part 154 or Part 157 of the Commission's Regulations thereunder, and

is without prejudice to any findings or orders which have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the respective applicants. Further, our action in this proceeding shall not foreclose or prejudice any future proceedings or objections relating to the operation of any price or related provisions in the gas purchase contracts herein involved. The grant of the certificates aforesaid for service to the particular customers involved shall not imply approval of all the terms of the respective contracts, particularly as to the cessation of service upon termination of said contracts, as provided by Section 7(b) of the Natural Gas Act. The grant of the certificates aforesaid shall not be construed to preclude the imposition of any sanctions pursuant to the provisions of the Natural Gas Act for the unauthorized commencement of any sales of natural gas subject to said certificates.

(D) The notice provisions of Section 154.94(b) and the detailed submittal subprovisions of Section 154.94(f) of the Commission's Regulations Under the Natural Gas Act are waived insofar as they apply to any reductions in rates hereby ordered.

(E) The certificate granted to North Central Oil Corporation (Operator), *et al.*, is conditioned upon a total initial price, including tax reimbursement, of 14.5 cents per Mcf at 14.65 psia, and within 30 days of the effective date of this order North Central shall file a supplement to its presently filed rate schedule reflecting the con-

ditioned price as the initial price in lieu of the initial price provided in the present rate schedule.

(F) The certificates granted to the applicants, other than North Central Oil Corporation (Operator), *et al.*, are hereby conditioned to a total initial price, including tax reimbursement, no greater than the applicable base area rate of 14.5 cents per Mcf at 14.65 psia subject to further reductions, effective as of the effective date of this order, for any quality deviations as determined pursuant to ordering paragraph (G) hereof, and further conditioned upon the filing by the respective applicants within 30 days of the determination of such rate of a supplement to its filed rate schedule reflecting the applicable area rate in lieu of any rate provided in the rate schedule then on file, and further conditioned upon refunds being made with interest by each applicant of the difference between the applicable area rate and any rate in excess thereof collected subsequent to the effective date of this order. The manner and time of such refunds shall be determined by the Commission in a later order.

277,807

(G) The certificate hereby granted to each applicant listed in Appendix A hereto, other than North Central Oil Corporation (Operator) et al., is issued upon the condition that such applicant (unless the sale qualifies as a small producer sale pursuant to the proposed rule issued this date) shall file, within 90 days of the effective date of this order, a statement that the gas accords with all pipeline quality standards established in Opinion No. 468 or in which respects the gas deviates from such standards,

the agreed cost to the buyer of processing the gas to bring it to the quality standards with respect to each quality defect and the resulting rate for the gas. Such statement shall be signed by both seller and buyer. However, if the seller and buyer are unable to agree upon any or all of the particulars entering into the computation of the proper price, the seller must so indicate in the statement and supply the information required to compute the applicable area rate as adjusted as well as the contentions of the parties with respect to the quality and amount of the adjustment as any item in dispute. The buyer may file a separate statement setting forth its views within such period.

(H) The certificate granted to Socony Mobil Oil Company, Inc. is issued upon the condition that the said applicant shall file within 120 days of the effective date of this order a report in triplicate with this Commission of the refunds due each buyer by reason of the collection by said applicant and its predecessor of rates in excess of the applicable area rate during the period in which such excess rates were collected prior to the effective date of the rate which is the subject of the present proceeding in Docket No. RI65-209.

277,808

(I) Socony Mobil Oil Company, Inc. shall retain the amounts shown in the report required under (H) above, subject to further order of the Commission directing the disposition of those amounts. If said applicant elects to commingle these retained refunds with its general assets and use them for its corporate purposes, it shall pay

interest thereon at the rate of 7 percent per annum on all funds thus available from the date of the filing of the refund report to the date on which they are paid over to the person ultimately determined to be entitled thereto in a final order of the Commission. If the applicant elects to deposit the retained refunds in a special escrow account, the respondent shall tender for filing on or before the date of the filing of the refund report an executed Escrow Agreement, conditioned as set out below accompanied by certificate showing service of a copy thereof upon each of its jurisdictional customers. Unless notified to the contrary by the Secretary within 30 days from the date of filing thereof, the Escrow Agreement shall be deemed to be satisfactory and to have been accepted for filing. The Escrow Agreement shall be entered into between respondent and any bank or trust company used as a depositor for funds of the United States Government and the agreement shall be conditioned as follows:

(1) Respondent, the bank or trust company, and the successors and assigns of each, shall be held and formally bound unto the Federal Power Commission for the use and benefit of those entitled thereto, with respect to all amounts and the interest thereon deposited in a special escrow account, subject to such Agreement, and such bank or trust company shall be bound to pay over to such person or persons as may be identified and designated by final order of the Commission and in such manner as may be therein specified, all of any portion of such deposits and the interest thereon.

(2) The bank or trust company may invest and re-invest such deposits in any short-term indebtedness of the United States or an agency thereof or in any form of obligation guaranteed by the United States which is, respectively, payable within 120 days as the said bank or trust company in the exercise of its sound discretion may select.

(3) Such bank or trust company shall be liable only for such interest as the invested funds described in Paragraph (2) above will earn and no other interest may be collected from it.

(4) Such bank or trust company shall be entitled to such compensation as is fair, reasonable and customary for its services as such, which compensation shall be paid out of the escrow account to such bank or trust company. Said bank or trust company shall likewise be entitled to reimbursement for its reasonable expenses necessarily incurred in the administration of this escrow account, which reimbursement shall be made out of the escrow account.

(5) Such bank or trust company shall report to the Secretary of this Commission quarterly, certifying the amount deposited in the trust account for the quarterly period.

(J) The decision whether refunds should be ordered as a condition of the permanent certificate of applicants, other than Socony Mobil Oil Company, Inc., listed in Appendix A hereto is deferred for subsequent determination. Such certificates shall issue at the present time subject to the condition that the subsequent determination of the Commission with respect to such refunds shall then be incorporated in each such certificate as a condition thereof.

(K) The certificate granted to each applicant listed in Appendix A hereto is issued upon the condition that the applicant shall not file any change in rate providing for

a price in excess of the applicable area rate prior to (1) subsequent order of the Commission in this proceeding permitting such filing or (2) January 1, 1968, whichever is earlier.

(L) The certificate of each applicant listed in Appendix A is issued upon the condition that the proposed rate schedule of the applicant shall be amended by the inclusion of the following language:

> "From the effective date of the order of the Federal Power Commission in the Permian Basin Area Rate Proceeding AR61-1, until January 1, 1968, no increase in rates may be filed, except in compliance with a specific order of the Commission, at a rate in excess of the applicable area rate as determined pursuant to said proceeding or pursuant to later order of the Commission. Applicable area rate, as that term is used herein, shall mean the rate to be determined after all adjustments from the ceiling price because of deviations from the pipeline quality standards established in the aforesaid order of the Commission."

(M) Except as herein granted the exceptions to the initial decision and proposed order are hereby denied.

By the Commission.

(SEAL)

Joseph H. Gutride,
Secretary.

OPINION NO. 468-A

DENYING APPLICATIONS FOR REHEARING OF OPINION NO. 468

(Issued October 4, 1965)

SWIDLER, Chairman:

On August 5, 1965, the Commission issued its Opinion No. 468 in the above-entitled proceeding. Applications for rehearing have been filed by various parties. The applications in part consist of a repetition of contentions which were fully considered in the course of reaching the determinations embodied in Opinion No. 468. However, the applications have persuaded us that certain modifications are required in the quality standards prescribed in Opinion No. 468. In addition we wish to clarify certain findings in the opinion with respect to which questions have been raised and to respond to certain contentions not previously advanced.

Initially we note and reject the contention by the respondent Phillips Petroleum Company and by Independent Petroleum Association of America that the participation of Commissioner Black and the Chairman in the Opinion and Order herein was improper because they had demonstrated bias and prejudgment on the issue whether competition among producers can be relied upon to justify their contract prices as just and reasonable under the standards of the Natural Gas Act. Nothing which has transpired since the release of Opinion No. 447, in which we rejected an earlier motion to disqualify Commissioner Black, leads us to doubt the correctness of our

conclusion there. The views expressed therein are equally applicable to the attempt, belatedly and retroactively, to disqualify the Chairman on the basis of his speech of September 22, 1964, to the Independent Natural Gas Association of America of which we take notice.[1]

[1] Speaking personally, I am unaware of any bias or prejudgment on the issue of competition or any other issue in this proceeding. It would have been impossible for me to have worked four years as a member and Chairman of the Commission without acquiring some knowledge of the economic forces which affect natural gas pricing and forming opinions on how they operate. I have formed and expressed some opinions on the questions raised by proposed legislation to repeal FPC regulation over sales by gas producers in interstate commerce. My speech to INGAA expressed my belief that the Natural Gas Act as interpreted by the Supreme Court to apply to gas producers is necessary to protect the interests of the consuming public and made clear that on this legislative question I had not been persuaded by the arguments that competition between producers was an adequate substitute for regulation. These views on the need for producer regulation, however, did not prevent me from fairly evaluating the evidence in this proceeding bearing on the weight to be given to competition in determining the standards for fixing just and reasonable area rates. — JCS

Quality Standards

We shall now discuss three changes and clarifications which we are making in the quality standards:

Pressure

Several producer-applicants argue that the standard of 800 pounds pressure for pipeline quality gas is not realistic, pointing out that most of the gas delivered in the Permian Basin in 1960 was delivered below that pressure. We agree. While the record supports our conclusion that 800 pounds is the pressure generally employed in the principal mainline segment of the pipelines in the Permian Basin, our conclusion did not give sufficient weight to the pipeline systems operated in the Permian Basin at much lower pressure and to the

actual delivery standards in the area. Upon further consideration we believe that a pressure standard of 500 pounds would more nearly reflect the pressure at which gas is delivered to the pipeline systems in the Permian Basin.

Shell Oil Company (Shell) posed the problem of the unfairness of a quality deduction for sales of gas which the producer is ready and able to deliver at pressures higher than those at which the buyer can accept gas. We think that this point is also well taken. The delivery pressure for purposes of quality adjustments shall be the pressure at which the seller is ready and able to deliver gas into the buyers' facilities without further compression, even if such pressure must be reduced so that it can

be conveniently accepted by the buyers' established facilities at the point of delivery. Our previous order will be modified in this respect.

Btu Adjustment for Flowing Gas

In Opinion No. 468 we specified a Btu adjustment for new gas-well but did not do so for flowing gas. Upon reconsideration we are persuaded by the producers' argument that there is no adequate justification for this difference in treatment, and we agree that the price for both new gas-well gas and flowing gas should be related to its energy content. The producers correctly point out that otherwise the quality adjustments on flowing gas would operate in only one direction. There would be no upward adjustment for gas rich in energy, but which would nevertheless be subject to a downward adjustment because of excessive sulphur or low pressure. We believe the reasons stated for applying the Btu content standard to new gas-well gas apply equally to flowing gas and our previous order will be modified accordingly.

The Btu adjustment will be applied to the area base rate before price adjustments for quality. In view of the fact that a majority of contracts for gas-well gas provide for a payment for liquids removed by the purchaser, Btu content should be measured after the removal of such liquids where such payment is made.[2] To measure Btu's prior to extraction of the liquids and then pay a bonus for high Btu content in the form of liquids would be a double payment.

[2] The same principle would also apply in the case of similar contracts for residue or casinghead gas.

278,707

Carbon Dioxide Adjustments

Under Opinion No. 468 a producer with gas containing excessive amounts of carbon dioxide is paid on the basis of the volume of gas remaining after deduction of the above standard volumes of carbon dioxide. The application of the Btu adjustment provision to flowing gas makes possible a somewhat simpler handling of rates in contracts containing a high percentage of carbon dioxide. In addition to the method described above, we can now provide the producers with the alternative of pricing their gas on the basis of the volume actually delivered to the pipeline which still contains the carbon dioxide provided that the Btu content of the gas is also measured at that time. In these circumstances gas consumers will not be paying for carbon dioxide because the Btu content will be considerably below the minimum 1,000 Btu content established as an area standard in this proceeding and the price will be reduced accordingly.

Under either alternative the pipelines' cost of processing actually incurred to remove the carbon dioxide should be deducted from the area base rate to determine the applicable ceiling price. If the producer prefers to price his gas on the basis of the volume remaining after the carbon dioxide is removed, the Btu content for purposes of the adjustment provided herein shall be measured on the basis of the volume of gas after such removal and the total amount to be paid for gas should also be computed on the volume of gas remaining after the carbon dioxide has been removed.

Recovery of Processing Costs by the Pipelines

In setting forth the procedures in Opinion No. 468 for determining the amount of the reductions from the base price to reflect processing costs to bring the gas up to our quality standards, we provided that we would accept agreements between the producer and the pipeline as to the extent of the processing costs involved. It has been suggested that the likelihood of reaching agreement in most cases has been impaired by an indication in the opinion that if a pipeline agreed with producers upon the amounts of processing costs it could not thereafter claim more as part of its cost of service. We did not intend such an arbitrary rule. We

recognize, of course, that no negotiated cost can be expected to be absolutely accurate, that costs may vary over the years, that legitimate processing costs may be incurred to bring the gas up to a quality standard higher than we are prescribing for rate adjustment purposes, that some processing facilities must incorporate reserve capacity for use in pipeline operations, and that there are other legitimate processing costs that may be in incurred by a pipeline not accounted for in the negotiated price.

We emphasize our desire to encourage agreement between the parties as to the proper amounts to be paid or deducted for quality adjustments. While we do not intend to permit the agreements between producers and pipelines to be used for the purpose of establishing arti-

ficially low processing costs, with the pipeline and ultimately the consumer making up the difference, we will approve all such agreements which reflect a good faith effort to approximate the processing costs involved, and accept for the pipelines' rate purposes the adjustments computed thereunder. In reaching such agreements the parties may utilize average processing costs where cost data for individual contracts are not readily available. No pipeline need fear that any such agreement will prejudice its claims to its legitimate costs not covered by the agreement.

New Gas-Well Gas From Committed Acreage

The producers contend that frequently there may prove to be extensive gas deposits at horizons below those already tapped by oil or gas wells. They strongly argue that the development of acreage now committed under old gas contracts may be inhibited if future discoveries of gas-well gas from such acreage do not command the higher ceiling for new gas-well gas. We believe this point deserves further consideration.

There is merit to the contention that the basis for classifying additional discoveries of gas-well gas from deeper reservoirs should not depend solely on whether there has been prior dedication but rather on whether such classification will encourage the directional search for gas. The issue is thus whether the new gas-well gas ceiling is needed in the public interest for gas from committed acreage. One factor to be considered is that lease acquisition costs have already been incurred in connec-

tion with committed acreage. Another relevant question is how much information as to the existence of gas at lower levels is provided by wells that have already been drilled.

278,709

On a full record, the producers may well be able to demonstrate that gas discovered in new reservoirs separate from existing reservoirs and at lower depths should command the new gas ceiling irrespective of prior dedications. On this record, however, the issue was not developed by the parties sufficiently to serve as a basis for departing from our past policy of applying the new gas price only to gas that has not yet been committed to the interstate market.

We believe the issue should be fully developed in the *Hugoton-Anadarko* case, AR64-1, and any change in policy will be applied prospectively to the Permian Basin.

Revenues v. Costs

A major argument presented in the several producer applications for rehearing is that, because of the quality adjustments (presumably even as we are modifying them herein), the Commission has not fixed area rates at a level high enough to produce overall revenues which would in the aggregate match producer "costs." The argument fails to take account of the fact that the cost of gas-well gas that served as a yardstick for establishing the area rate includes a twelve percent rate of return (amounting to about 5 cents per Mcf) which the Commission expressly indicated was set at this figure in part

(and in the case of flowing gas, where the problem of low-quality gas is more pronounced, in large part) in order to compensate for the risk of finding gas of less than pipeline quality.

The producer's "revenue deficiency" argument is also in error in assuming that the flowing gas costs 14.5 cents per Mcf, or that the Commission so found. The Commission used the cost of flowing gas-well gas as the basic yardstick for fixing the price of all flowing gas (for the reasons stated in Opinion No. 468, pp. 70-77). While the cost of residue gas cannot be found with the precision requisite to serve as a basis for fixing ceiling prices, the evidence in the record makes clear that with respect to casinghead gas and residue gas derived therefrom (which together make up by far the largest share of the Permian gas subject to quality adjustments)

the costs are substantially below the 14.5 cents per Mcf ceiling price. For one thing the price includes a 4.08 cents allowance for exploration and development expense even though such gas was largely found as a by-product of the search for oil. For another, there would be no reason to allow producers a 12 percent rate of return on their investment for processing residue gas since the investment in processing plants and equipment is subject to few of the special risks incurred by those who explore for and develop reserves of gas.

We do not mean to suggest that the E&D allowance and the profit which we have provided for flowing gas is not fully justified, but we believe it is relevant to point

out that these two items, which account for 9.0 cents of the 14.5 cents price for flowing gas, are based in part on justifications other than cost, and provide ample allowance for the risk that low-quality gas in the area may not command the full area price.

It is relevant also in any comparison of revenues and costs in the Permian Basin to consider the additional producer revenues under the *Spraberry* contracts which govern the sale of approximately 20 percent of the gas sold in the Permian Basin. Under these contracts the producers will receive, in addition to the ceiling price for residue gas, substantial payments for the liquids which the pipelines extract from the unprocessed gas. The record does not reveal the precise amount of such revenues but the contracts and billing statements on file with the Commission confirm that they are substantial.

The producers' comparison of revenues and costs also fails to reflect a substantial amount of revenue which we did not take into account in any way in computing the cost of old gas-well gas, and which we may have underestimated in determining the new gas-well gas price. We refer to the payments received by the sellers of gas-well gas for liquid hydrocarbons extracted from the gas by the pipelines. El Paso points out in its application for clarification that these liquid credits approximate on the average 0.6 cents to 0.8 cents per Mcf in the Permian Basin. This may be contrasted with the plant liquid credit of 0.2 cents based on nationwide statistics used in computing the cost of new gas-well gas and the absence of any such credit against costs in the flowing gas computation.

The precise amount of the plant liquid credit which El Paso states it pays to the producers is not verified by evidence in the record although the contracts for the sale of gas-well gas in the area reveal that such payments are generally made. In these circumstances we do not believe it appropriate to adjust the cost to reflect this undetermined amount of additional producer revenue. However, it is clear that this revenue, which is separate and apart from payments for excess Btu's in the gas after removal of liquids, tends to offset any reduction in aggregate revenues due to downward quality adjustments.

The application by the Major Producers refers to "the Commission's finding that jurisdictional revenues will equate to jurisdictional costs." The Commission made no such finding. Obviously the Commission cannot allow higher rates to offset "revenue deficiencies" resulting from producer contract prices below the area ceiling. The Major Producers' own petition states that the "revenue deficiencies" resulting from these contractural limitations amounts to 0.76 cents per Mcf. It would be contrary to all regulatory principles to permit prices in excess of an otherwise just and reasonable rate for certain purchases merely because other sales had been voluntarily made at below full cost as herein determined.

It is argued that because it is impossible to quantify exactly the extent of quality discounts there can be no basis for determining the validity of the Commission's rate of return determination either as a whole or to the

extent that it purports to reflect the risk of quality deficiency. The record does not leave us as much in the dark in this matter as the producers would have us believe. As Commissioner O'Connor stated in his concurring opinion, the record indicates that for gas-well gas under Opinion No. 468 "the reasonable amount of the average adjustment will be in a range of from 1.0 cents to 1.7 cents." With the changes we have here made with respect to quality standards, the average adjustments for gas-well gas will range from 0.7 cents to 1.5 cents, reduced by the additional revenue for plant liquids and the effect of the Btu adjustment.

278,712

As to the flowing gas, the additional upward adjustment for gas with a Btu content of more than 1,050 Btu, coupled with the change in pressure standards substantially reduces the amount of downward adjustments. We have already noted the offsetting revenues to the producers from liquid credits and the fact that the cost of residue and casinghead (the bulk of the gas in the area) is substantially lower than the 14.5 cents price.

While it is true that neither the amount of the downward quality adjustments or the offsetting sources of additional revenue can be determined precisely, we are convinced that the record fully justifies the Commission's judgment that the ceiling prices we have fixed "provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur" in the Permian Basin.

Flowing Residue Gas-Cost and Price

It has been stated in the applications of several producer-respondents that the price of residue gas derived from casinghead gas should be fixed at a higher price because the record contains evidence which would establish this cost at a level above the 14.5 cents per Mcf based on gas-well gas costs. The record does not support this argument. On the contrary, while a precise cost computation of residue gas cannot be made with sufficient assurance of accuracy to serve as a basis for fixing prices the evidence demonstrates that the cost of residue gas is lower than the cost of flowing gas-well gas. The defects in the evidence which the producers cite were pointed out by the examiner. (Initial Decision, pages 103-107.) The staff in its exceptions agreed with the examiner's downward adjustment of its figures. Without passing on the merits of the evidence it certainly does not support a higher price for residue gas.

The Differing Base Rates in Texas and New Mexico

Some of the applicants appear to have misunderstood the nature of our determination in fixing base rates for Texas production inclusive of production taxes, while fixing base rates for New Mexico to which present New Mexico taxes may be added. At the present time taxes in New Mexico are not

uniform, and different sales of natural gas within that state may be subject to quite different taxes. In the State of Texas, on the other hand, a production tax of 7 percent

applies uniformly to all sales. It is possible, therefore, to compute base rates including taxes which would be applicable to all Permian Basin production within the State of Texas. Since this is not possible with respect to New Mexico production, a different formula is used. The net result, however, is precisely the same for the two states — in each case the present taxes are included in computing the total prices which may be charged. This is not a determination that any and all taxes which the State of New Mexico may choose to impose in the future may be added to New Mexico base prices.

In its petition for rehearing El Paso requests the Commission to clarify whether in computing the applicable state and local production taxes for New Mexico there should be included the New Mexico Oil and Gas Ad Valorem Production Tax. The records of this proceeding show that such a tax is a property tax, not a production tax, and as such was included in our computation of the cost of finding and producing gas. Accordingly such tax shall not be included in computing the applicable New Mexico production taxes.

Refund Below the Last Clean Rate

First raised by Skelly, and repeated in other applications, is the contention that "the Commission's refund order exceeds its refund authority under Section 4(e) which is limited to the increased increment in the rate between the time the suspended increased rate is made effective and the date of the Commission's final order in the suspension proceeding." With this contention we

need not deal at this time, since no such situation has been presented as resulting from our order herein. It will be time enough to deal with this issue when and if it is established that any refunds below the last clean rate are required.

Classification of Gas on Basis of Contract Date

It has also been contended that contracts should not be classified as contracts for new or old gas by reason of the date of the contract, but rather on the basis of the date the gas was first committed to interstate commerce, assuming commitment occurred at a later date. We have chosen the

date set forth in the contract because that date is precise, definite and certain, whereas the date of commitment of gas to interstate commerce is less easy of ascertainment. We therefore do not believe any change in our decision on this issue is warranted.

Refunds — Pipeline Verification

We agree with El Paso that a condition should be attached to the refund requirement that it should be required that the purchaser verify the refund calculations, and the order accompanying this opinion will so provide.

Method of Rate Determination

Some confusion apparently exists with respect to the method of determining the proper price under a given contract. If a producer has a contract calling for a stated

price with specified increases for additional Btu content or specified deductions for certain quality deficiencies, the contract price is to be computed as though no price regulation existed. As a second step it will be necessary to compute the applicable area rate for the gas sold under the contract, without regard to the contract price provisions. The area rate will be the applicable base rate plus or minus the quality adjustments allowed or required by our decision and order. The proper rate to be charged and collected under the contract will be the contract price if it does not exceed the applicable area rate. If it exceeds the applicable area rate the latter will apply.[3]

278,715

Rates Involved in Application of Order to Unconsolidated Section 4(e) Proceedings

In the Addendum to its Supplemental Application for Rehearing Shell inquiries whether ordering paragraph (E) of Opinion No. 468 applies to pending Section 4(e) proceedings not consolidated herein but which are subject to the Order to Show Cause issued in conjunction with Opinion No. 468. Paragraph (E) as previously

[3] For example, if a contract for new gas-well gas provides for a price of 16.0 cents with a proportionate upward Btu adjustment for Btu's in excess of 1,000 per Mcf, and the gas contains 1,030 Btu's per Mcf, the contract price would be 16.48 cents, assuming there are no other adjustments called for under the contract. The applicable area rate in Texas would be 16.5 cents per Mcf — the area base price with no upward or downward Btu adjustment, since 1,030 Btu's is in the range between 1,000 and 1,050. The proper rate chargeable under the contract would be 16.48 cents. If the same contract were for old gas-well gas produced in Texas the proper rate would be 14.5 cents since the applicable area rate would be lower than the contract rate.

modified requires that a supplement be filed by November 15, 1965, to each filed rate schedule in excess of the area base rate reflecting reductions to conform the filed rate to the area base rate. Pursuant to section 5(a) of the Act we have ordered all rate schedules of respondents which are in excess of area base rates to be reduced in conformity with paragraph (E). The fact that a respondent's rate schedule may be subject to an unconsolidated section 4(e) proceeding for a past period does not relieve respondent of filing a supplement in conformity with paragraph (E). The only remaining function of the unconsolidated section 4(e) proceeding is with respect to refunds for past periods to which the section 5(a) proceedings do not apply.

Requests for Stay of Order

A number of the producers have requested a stay of all or some of the ordering paragraphs of Opinion No. 468, until after completion of contemplated judicial review proceedings. Section 19(c) of the Natural Gas Act makes it clear a stay is not warranted for the sole reason that judicial review is to be sought. At a minimum, parties seeking a stay should demonstrate that any injuries they suffer, absent a stay, would be irreparable and would outweigh the irreparable injury to the public from granting the stay. See, *e.g.*, *Virginia Petroleum Jobbers Association* v. *F.P.C.*, 259 F. 2d 921 (CADC); *Associated Securities Corp.* v. *S.E.C.*, 283 F. 2d 773 (CA10); *Tennessee Gas Transmission Co.* v. *F.P.C.*, 283 F. 2d 729 (CA5).

The producers failed to make such a showing. If the order were set aside, the producers would not be precluded from recovering the difference between the rates collected and the rate which the producers should have been permitted to collect.[4] The Commission, in the event of judicial reversal, would have adequate authority, including power to fix future rates, to take any necessary corrective action to protect not only the producers but also the pipeline purchasers.

In any event, even a showing of irreparable injury would normally not be sufficient in itself to warrant a stay of a rate reduction or moratorium order when it is outweighed by the detriment to the public. As the courts have held (*e.g., Virginia Jobbers Association* v. *F.P.C.*, 259 F.2d 921 (CADC)), the effect of a stay on other interested parties and the public interest are of at least equal significance to the impact on private parties of its denial. In this case, grant of stay would mean the continued collection of rates which we have found, after careful consideration, to be excessive. Even if all such amounts were subject to refund requirements, it is well recognized that the protection afforded through the re-

[4] *Hunt Oil Company, et al.*, in their motion for stay, recognize this in their alternative suggestion that some of the ordering paragraphs, including paragraph (H), imposing the rate increase moratorium, be made effective "upon the express condition that to the extent that they are not judicially affirmed, if judicial review is sought thereon, they will be null and void *ab initio* and appropriate redress procedures would be adopted by the Commission to rectify any detriment which the Movants might suffer as a result of compliance with the Ordering Paragraphs which are subsequently reversed or modified."

fund procedure will not give full protection to the ultimate consumers. *F.P.C.* v. *Tennessee Gas Transmission Co.*, 371 U.S. 145, 154-155; *F.P.C.* v. *Hunt*, 376 U.S. 515, 524-525. We need not repeat the discussion set forth in Opinion No. 468 of why the moratorium of rate increases above the ceiling prices is essential. A stay of the moratorium would mean its elimination. As we observed

"Without a moratorium, the conclusion of one area proceeding would only signal the beginning of the next, and just and reasonable rates for consumers would always be one area proceeding away." [Opinion No. 468, p. 108]

Delay in giving effect to the ordered rate reduction in this case will be doubly injurious to the California consumer to whom most of the Permian gas is delivered, because it is our understanding that the Southern California distributing companies which purchase gas from El Paso and Transwestern also purchase substantial quantities of gas from California producers under long-term contracts in which the price is geared to the weighted average California border price for wholesale gas and is adjusted to reflect the border price in effect January 1 of each year. See *Re Pacific Lighting Gas Supply Co.*, 44 PUR 3d 177, 184 (Calif. P.U.C., 1962). Thus, a stay of the ordered rate reductions and the consequent delay in pipeline rate reductions would result in unrecoverable losses to the California distributing companies and presumably their customers. The Court of Appeals for the Fifth Circuit expressly took this factor into account in denying El Paso's request to stay the rate reductions ordered by us

in October 1962, *El Paso Natural Gas Co.* v. *F.P.C.*, CA5, No. 20180, December 21, 1962 (unreported).

Several producers also base their request in part on the assertion that, absent a stay, complex problems relating to royalty payments and state tax payments will have been created. It is not shown that such problems would cause irreparable harm. Moreover, as applicants recognize, any stay that might be issued should be on condition that all rates required to be reduced under Opinion No. 468 be collected subject to refund obligations at least for the period starting September 1, 1965, the effective date of Opinion No. 468. In view of this, it would not appear that an immediate rate reduction, with the opportunity for recoupment of undercharges in the event of judicial modification or reversal of our order, would create more complex problems with respect to royalty and tax payments than would exist with respect to the collection of rates subject to refund, pursuant to either a stay condition or existing requirements.

In these circumstances, the requested stay of the ordered rate reductions and the moratorium on increased rates would be totally unwarranted.

Even though the Opinion No. 468 does not require refunds to be made for rates collected prior to September 1, 1965, until further Commission action is taken, it is appropriate to indicate now that we will not take such further action until at least after the decision by the Court of Appeals which reviews Opinion No. 468. We

recognize that with respect to rates collected subject to refund for as much as 8 years prior to Opinion No. 468, the various inadequacies of the refund procedure as they relate to this case cannot be avoided even by immediate refunds. The prompt effectuation of just and reasonable rates for the future is of primary importance and the deferral of refunds due will provide additional insurance that our order in this respect cannot result in irreparable injury to the producers. Postponement of further Commission action requiring refunds is therefore deemed appropriate.

Other Matters

Certain producers presented contentions which related to their individual circumstances. Without suggesting that these contentions stated adequate grounds for special relief under Opinion No. 468 it is clear that they do not state any basis for modification of our area rate order which is of general application.

Numerous other arguments were advanced by producers in their application for rehearing but they have all been adequately disposed of by the full discussions supporting our findings and order in Opinion No. 468. The applications, therefore, should be denied except insofar as we have modified our order as provided herein.

278,719

The Commission further finds:

(1) The quality standards and adjustments to the base area rates set forth in Opinion No. 468 and accompanying order should be modified as provided in the ordering provisions hereinafter set forth.

(2) The applications for rehearing and accompanying motions set forth no new facts or principles of law which either were not fully considered by the Commission when it adopted Opinion No. 468 and its accompanying order, or which now being considered warrant any change in, vacation or modification of such order, except as set forth herein.

(3) Good cause has not been shown for reopening this proceeding for receipt of additional evidence.

The Commission orders:

(A) Each and every reference in Opinion No. 468 or its accompanying order, or in Opinion No. 468-A or this accompanying order, to Texas Railroad District No. 8 shall be considered to include both the present Texas Railroad Districts 8 and 8-A.

(B) Paragraph (B) of the order issued together with Opinion No. 468 shall be amended to read as follows:

"(B) *Quality Standards and Adjustments to the Base Area Rates*

(1) The base area rates fixed in ordering paragraph (A) herein shall be adjusted for any deviations from the standards for pipeline quality gas in Texas Railroad District Nos. 7-c and 8, and in the New Mexico counties of Lea, Eddy and Chaves, which are hereby established as follows:

a. *Carbon Dioxide:* Pipeline quality gas shall contain not more than 3 percent carbon dioxide by volume.

b. *Hydrogen Sulphide:* Pipeline quality gas shall contain not more than 10 grains of hydrogen sulphide per Mcf of natural gas at 14.73 psia and 60° F.

c. *Total Sulphur:* Pipeline quality gas shall contain not more than 200 grains of total sulphur per Mcf of natural gas at 14.73 psia and 60° F.

d. *H_2O:* Pipeline quality gas shall contain not more than .009 pound of H_2O per Mcf of natural gas at 14.73 psia.

e. *Other Impurities:* Pipeline quality gas shall contain no oxygen, dirt, dust, gum, or other impurity in sufficient amounts to require the buyer to incur processing costs to eliminate such impurities in order for the gas to meet either customary commercial standards or the customary requirements of any of the interstate pipelines in the area.

f. *Pressure:* Pipeline quality gas shall be delivered at a pressure of not less than 500 pounds per square inch gauge.

g. *Btu Adjustment:* The maximum standard will be 1,050 Btu's per cubic foot at 14.73 psia and 60° F. and the minimum standard will be 1,000 Btu's per cubic foot at 14.73 psia and 60° F. Upward and downward adjustments of the base area rates will be on a proportional basis as specified at pages 99-100 of Opinion No. 468 if the Btu content exceeds the maximum standard or is below the minimum standard.

(2) When a purchaser buys gas which deviates from the quality standards established in subparagraph (1) above, the base area rate fixed in ordering paragraph (A) shall be adjusted for any deviations from such standards as follows:

a. The applicable base area rate shall be adjusted downward by the net cost, actually in-

curred prior to ultimate consumption, of processing the gas to bring it up to standard.

278,721

(i) If the processing is performed by the purchaser, a reasonable return upon the net investment should be included as part of the processing cost incurred in bringing the gas up to pipeline quality.

(ii) If such processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

(iii) If the seller is ready and able to deliver natural gas into buyer's facilities without further compression, at pressures higher than the pressure at which the buyers' facilities available at the point of delivery can accept such gas, any downward adjustment for the cost of compression shall be limited to the cost of such compression as is incurred to raise the pressure of the gas from the pressure at which the seller is ready and able to deliver it up to the pressure standard of 500 psig.

b. The applicable base area rate shall be adjusted downward or upward by the amount of any applicable Btu adjustment.

c. In the case of delivery by seller of gas containing carbon dioxide in excess of the standards herein permitted, notwithstanding anything to the contrary in Paragraph (2)(ii) of this order, the producers shall have the alternative of receiving payment for the total volume of gas delivered, including the carbon dioxide,

provided that the Btu content of the gas is measured before removal of the carbon dioxide for the purposes of the Btu adjustments specified in this order, or receiving payment for the volumes exclusive of the carbon dioxide with the Btu content measured by the volumes of gas only."

278,722

(C) Ordering paragraph (F)(1) of the order accompanying Opinion No. 468 is hereby amended by deleting "for new gas-well gas" from line 17 of said ordering paragraph.

(D) Ordering paragraph (I) of the order accompanying Opinion No. 468, designated "Refund Reports", is hereby amended by inserting after the first sentence of said ordering paragraph, the following:

"Within 10 days from the filing of the refund report the buyer shall file its written concurrence or disagreement with such report."

(E) Ordering paragraph (J) of the order accompanying Opinion No. 468 is hereby amended by changing "(E)" to "(I)" in line 2 thereof.

(F) Appendix A, Part III to Opinion No. 468 and its accompanying order is hereby amended as follows:

(a) Page 17, with reference to "Robertson, French, M. & J. P. Bryan (formerly G. Stratton, Jr. (Operator), *et al.*,)" insert a "**" after Docket No. G-16535.

(b) Page 21, delete "Sun Oil Company" and the related Docket No. "RI60-123."

(c) Page 21, delete "Sun Oil Company (Operator), *et al.*" and related Docket No. "RI60-124."

(d) Page 7, with reference to "Aikman, Claude E.", delete Docket No. "G-18466."

(e) Page 21, with reference to "Superior Oil Company, The" delete Docket Nos. "G-18771" and "G-20075."

(G) Appendix D to Opinion No. 468 and its accompanying order is amended to conform to the form of Appendix D to Opinion No. 468-A and this accompanying order.

278,723

(H) The applications for rehearing of Opinion No. 468 and accompanying order, and the motion of Hunt Oil Company, *et al.*, to reopen this proceeding for receipt of additional evidence, are hereby denied.

(I) The motions for stay of Opinion No. 468 and accompanying order, except to the extent granted by the Order Granting Time Extension issued September 28, 1965, in this proceeding, are hereby denied.

By the Commission. Commissioner O'Connor concurring filed a separate statement appended hereto.

(SEAL)

Gordon M. Grant,
Acting Secretary.

O'CONNOR, Commissioner, *concurring:*

Though concurring in the result reached by the majority, I do not rely upon their reasons, and I specifically re-emphasize my position in regards to the 50-Btu gap. It is apparent from the petitions for rehearing of our Opinion No. 468 that a strong possibility exists producers will not be in a position to realize aggregate revenues which reasonably approximate their aggregate costs. Since the specific problem is that of rate design for quality deviations, the impact of which cannot be determined on the record before us, rehearing is properly denied; nevertheless, once the impact is made clear by the quality adjustment determinations, it is entirely likely that rate revisions will be required.

It must be emphasized that, while the specific problem is that of proper quality adjustments, the impact of the overall adjustments can be burdensome to the extent the entire regulatory method is vulnerable. Clearly the impact of a regulatory rate must be considered, *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591, 602 (1944), and, in the event the order does not permit the regulated enterprise an opportunity to recover its costs, then it must fall, *Natural Gas Pipeline Co.* v. *F.P.C.*, 315 U.S. 575, 590 (1942). This rule is applicable as well to group cost

regulation. Cf. *Bowles* v. *Willingham*, 321 U.S. 503, 517-519 (1943). Inherent in the majority opinion is an acknowledgment of this state of the law, and presumably a clear showing of an adverse impact will command revision. It is my position that further revisions will commend themselves to us once the quality impact is clarified.

The record does not permit a meaningful determination of the impact. As discussed in my separate opinion, the probable range will be 1.0 to 1.7 cents. This range is based upon various allegations of a general nature at the hearing and upon the ascertainable costs of processing out the deficiencies. The modified standard for pressure, and the general application of the upward Btu adjustment further alleviates the downward impact. In my opinion the upward adjustment from 1000 Btu's would represent a proper accommodation of costs to quality, and it should be adopted as a proper measure of quality standards. This is all the more compelling in light of the comprehensive study by Shell Oil Company in their Supplemental Petition for Rehearing. According to their figures the maximum

278,726

downward impact could be in a range from 1.86 to 2.27 cents. Adjusted for the revised quality standards adopted today, this range could be 1.6 to 2.0 cents. If the quality impact is of these proportions modification may be required.

I reject the broad generalities relied upon by the majority for rejecting the cost-revenue argument. Their

broad conclusion that producers realize sufficient revenues in any event must be rejected. Federal regulation extends only to natural gas, and producers cannot be compelled to offset a deficit from the commodity with revenues from non-jurisdictional petroleum sales. Cf. *Baltimore & Ohio R.R.* v. *U.S.*, 345 U.S. 143 (1953). It is my position that where the public demands the creation of fettered enclaves of business enterprise, fundamental fairness requires that this same public shoulder the financial requirements of that enterprise. Further contradicting the majority position, it is far from clear that residue costs are less than gas-well costs. At the hearing and in argument before the Examiner, Staff initially took the position that residue costs were probably higher. To bury the quality impact in our rate of return determination is to overlook the basis for the 12 per cent allowance: comparable return on equity of 10-12 per cent by the far less risky operations of transmission companies. Finally, as regards self-imposed revenue deficiencies, many of the lower contracts apparently reflect quality deductions so that revenues realized under those contracts may remain below cost even under the quality standards we have prescribed.

The only proper basis for rejecting the quality impact argument is that the impact cannot be established. The actual conditions of delivery cannot be accurately determined from the record. Furthermore, the quality standards we prescribe may result in less onerous adjustments than the contracts require. We are thus left in the position of being unable to determine the impact. It is my

position that with the elimination of the Btu gap, any present doubts would disappear, and it is probable that no further adjustments would be required.

Robert T. Brown (Operator) *et al.*	CI61-733
Texaco Inc.	

ORDER DENYING REHEARING AND MODIFYING ORDER WITH RESPECT TO ISSUING CERTIFICATES

(Issued October 4, 1965)

On August 5, 1965, this Commission issued its order in this proceeding granting certificates of public convenience and necessity to four producers upon stated conditions, among which were included price conditions to the applicable area rates as established by Opinion No. 468 and accompanying order issued the same day. Applications for rehearing of Opinion No. 468 and the Order Issuing Certificates were filed by *North Central Oil Corporation, (Operator) et al.*, (North Central) and *Texaco Inc.*, two of the producers to whom certificates

were issued, and the applications of others for rehearing of Opinion No. 468 were also addressed to the Order Issuing Certificates. By Opinion No. 468-A and accompanying order issued this day we have denied the applications for rehearing of Opinion No. 468 and its accompanying order while modifying that opinion and order in certain respects.

North Central, in its application for rehearing states that its original contract was dated in 1960 but that the Supplemental Gas Purchase Agreement which was the subject of the same filing was dated March 9, 1961. It is North Central's contention that the gas dedicated under the supplemental agreement of March 9, 1961, is entitled to the new

gas-well gas price of 16.5 cents per Mcf, since the supplemental agreement was dated after January 1, 1961, the dividing date between old and new gas-well gas. North Central argues that it would be pure formalism to require a new and separate contract instead of a supplemental agreement in order to allow a producer to charge and collect the applicable area rate for new gas-well gas. We agree. Accordingly, our Order Issuing Certificates of August 5, 1965, will be modified to provide that the price condition in the certificate to be issued to North Central allow a price of 16.5 cents per Mcf for natural gas moving under the supplemental agreement of March 9, 1961.

One further matter requires clarification. The applications of *Socony Mobil Oil Company, Inc.*, (Docket

No. CI61-34) and *Texaco Inc.* (Docket No. CI61-879) involve Spraberry contracts discussed in detail in Opinion No. 468. Consistent with that discussion and the arguments advanced in the applications for rehearing we believe the applicable area rate should be applied to the residue volumes, with no deductions therefrom if the residue volumes meet the pipeline quality standards set forth in Opinion No. 468, as modified by Opinion No. 468-A. The consumers will thus pay no more for gas under the Spraberry contracts than any other gas of similar quality. As we indicated in Opinion No. 468, if the pipelines' processing costs exceed the liquid revenues the pipeline can petition for relief in the form of "an appropriate reduction in the price the pipeline pays for such residue gas." Our previous discussion in the Order Issuing Certificates herein is so modified. Any deductions required by contract must, of course, be utilized in determining the contract rate.

The applications for rehearing of the Order Issuing Certificates set forth no other facts or arguments which differ from those which were advanced and fully considered prior to our determinations of the issues in Opinion No. 468 and accompanying order and our determinations of the issues in the original Order Issuing Certificates. Accordingly, the applications for rehearing will be modified as previously stated.

278,729

The Commission finds:

(1) The natural gas to be sold by *North Central Oil Corporation, (Operator) et al.*, under the Supplemental

Gas Purchase Agreement of March 9, 1961, is new gas-well gas as defined in Opinion No. 468 issued August 5, 1965.

(2) Except as stated herein, the arguments and assignments of error presented by the applications for rehearing warrant no change or modification in the Order Issuing Certificates issued August 5, 1965.

The Commission orders:

(A) Paragraph E of the prior Order Issuing Certificates issued August 5, 1965, is amended to read as follows: "The certificate granted to *North Central Oil Corporation (Operator) et al.*, is conditioned upon a total initial price including tax reimbursement of 14.5 cents per Mcf at 14.65 psia for all gas other than that sold pursuant to the Supplemental Gas Purchase Agreement dated March 9, 1961, and upon a total initial price including tax reimbursement of 16.5 cents per Mcf at 14.65 psia for all gas sold pursuant to the Supplemental Gas Purchase Agreement. On or before November 1, 1965, *North Central Oil Corporation, (Operator) et al.*, shall file a supplement or supplements to its presently filed rate schedule reflecting the conditioned prices as the initial prices in lieu of the initial price provided in the rate schedule.

(B) The applications for rehearing of the Order Issuing Certificates of August 5, 1965, are hereby denied.

By the Commission.

(SEAL)

Gordon M. Grant,
Acting Secretary.

FILED
United States Court of Appeals
Tenth Circuit

JAN 20 1967

William L. Whittaker
Clerk

Before LEWIS, BREITENSTEIN and HILL, *Circuit Judges.*

BREITENSTEIN, Circuit Judge.

The first area rate decision of the Federal Power Commission is before us for review. It relates to prices for jurisdictional sales of natural gas produced in the Permian Basin, a famous petroleum area where oil and gas are found in hundreds of reservoirs and thousands of wells. The states of Texas and New Mexico, the nation's oil and gas industry, and several related associations attack the decision. The State of California, the cities of San Francisco, Los Angeles, and San Diego, various local distributors, and an organization of such distributors supported. The rejection of the individual company cost-of-service approach to the regulation of independent producers and the adoption of the area rate method raise many novel issues which have been extensively and ably argued. We hold that neither the United States Constitution nor the Natural Gas Act bars the regulation of natural-gas prices on an area basis; that the Commission did not abuse its discretion in adopting the area method; and that the cases must be remanded because the actions of the Commission do not comply with the end result test established in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602-603, and other decisions.

The petitions for review, all brought under § 19(b) of the Natural Gas Act,[1] attack Opinions Nos. 468 and 468-A of the Commission fixing just and reasonable rates

---

[1] 15 U.S.C. §§ 717-717w.

under §§ 4 and 5 of the Act for natural gas produced in the Permian Basin and sold to interstate pipeline companies.

1. *Background.*

The Permian Basin, as defined by the Commission, includes Texas Railroad Commission Districts Nos. 7-C, 8, and 8-A and the New Mexico counties of Chaves, Eddy, and Lea. Nationally, it accounts for about 11% of all the gas sold in interstate commerce. The Commission joined 336 producers as respondents in the consolidated proceedings. Sales by them are made to three interstate pipelines, none of which appear here.[2] About 85% of the Permian gas moving interstate goes to California.

Nearly two-thirds of the Permian gas production comes from oil-well gas, that is, gas produced in conjunction with oil. Because of impurities much of the gas must be processed before introduction to an interstate pipeline. Until El Paso began its purchases, Permian oil-well gas was generally vented or flared because of the lack of a market.

The natural-gas industry has three main parts, the producers, the interstate pipelines, and the distributors. The last are under state or local regulation exclusively. The Commission began federal regulation of the interstate pipelines after the passage of the Natural Gas Act

---

[2] El Paso Natural Gas Company began buying Permian gas in 1945, Northern Natural Gas Company through a predecessor in 1954, and Transwestern Pipeline Company in 1958. In 1961, El Paso purchased 73% of the Permian gas moving in interstate commerce, Northern 18%, and Transwestern 9%.

of 1938. It did not attempt to regulate independent producers[3] until the 1954 decision of the Supreme Court in Phillips Petroleum Co. v. Wisconsin, 347 U.S. 672, (First Phillips) which held that the Act applied to them.

Section 7 of the Act forbids the sale of natural gas subject to Commission jurisdiction without a certificate of public convenience and necessity granted after notice and hearing. Temporary certificates, issued without notice and hearing, are authorized. Our recent decision in Sunray DX Oil Company v. Federal Power Commission, 10 Cir., ... F.2d ....., discusses § 7 procedures and problems. These are not present here because the § 7 applications considered in the consolidated proceedings before the Commission were disposed of in a separate order.

Section 4 requires that all rates shall be just, reasonable, and nondiscriminatory. No change shall be made in a rate without 30 days' notice. When a schedule containing a changed rate is filed, the Commission on its own initiative or on complaint may suspend the rate and set the matter for hearing. The suspension may be for not longer than five months. If no decision is reached within that period, the increased rate becomes effective but the Commission may require a bond conditioned upon the refund of that portion of the increased rate found not to be justified. The instant proceedings involve a number of increased rate filings which were suspended under

---

[3] The word "independent" is used to describe a producer which does not transmit gas interstate either by its own operations or those of an affiliate. Some of the interstate pipelines produce a share of their own gas and sell gas to other pipelines.

§ 4 and which were disposed of by Opinions Nos. 468 and 468-A.

Section 5 provides that whenever the Commission, after hearing had on its own motion or on complaint, finds that a rate is "unjust, unreasonable, unduly discriminatory, or preferential" it shall determine "the just and reasonable rate." In the proceedings at bar the Commission pursuant to § 5 established "the future rates for jurisdictional sales of gas by producers in the area."

After the First Phillips decision the Commission received thousands of certificate applications from producers. The situation was complicated by the need of pipelines for a committed source of supply sufficient to justify financing. To obtain such supply long-term contracts, commonly for 20 years, were made with the producers. They in turn, because they could not file unilaterally for an increased rate contrary to contract and because they desired protection against the unforeseeable economic conditions of the future, insisted on escalation clauses of various types.[4] A general price rise occurred. As the escalation provisions became operative the producers filed under § 4 for increased rates and the Commission suspended many of them. Section 7 applications were under contracts calling for rates comparable to those which the Commission had suspended. This trend was ended by the 1959 decision in Atlantic Refining Co. v. Public Service Commission of New York, 360 U.S. 378, (CATCO) which directed the Commission in certificate cases to keep initial prices in line.

---

[4] See Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F.2d 241, 243.

After the remand in First Phillips, the Commission proceeded with the consideration of just and reasonable rates required by §§ 4 and 5 on the individual company cost-of-service basis which it had long applied in the regulation of electric power companies and interstate pipelines. The first case to reach the decisional stage was that relating to Phillips. On September 28, 1960, the Commission entered Opinion No. 338[5] in which it held that the regulation of independent producers under the Act could be accomplished more appropriately by the establishment of area rates than by the establishment of producer rates on individual cost-of-service findings. Contemporaneously with this Phillips decision, the Commission promulgated its Statement of General Policy No. 61-1[6] which established 23 rate areas and, with unimportant exceptions, announced maximum rates for each area. Two price standards were set, one for initial prices in new contracts and one for escalated prices in existing contracts. For the Permian Basin area the prices were 16 cents and 11 cents respectively.

Opinion No. 338 was affirmed by the Court of Appeals for the District of Columbia Circuit[7] and by the Supreme Court in Wisconsin v. Federal Power Commission, 373 U.S. 294, 310, (Second Phillips) wherein the Court observed that it shared "the Commission's hopes that the area approach may prove to be the ultimate solution" to the problem of regulating the independent producers.

[5] 24 FPC 537.

[6] 24 FPC 818.

[7] Wisconsin v. Federal Power Commission, D.C. Cir., 303 F.2d 380.

The first area rate proceeding was that for the Permia Basin and was initiated on December 23, 1960.[8] It wa followed by a similar proceeding for the South Louisian area,[9] for the Hugoton-Anadarko area,[10] and for th Texas Gulf Coast area.[11] The last three are in the hearin stage. The Permian Basin proceeding was decided b Opinions Nos. 468 and 468-A to which we turn.

2. *The Decision of the Commission.*

The 131-page original opinion, No. 468, followed b the 23-page opinion denying rehearing, No. 468-A, nee only be summarized at this point. The Commission foun the area rate principle free from constitutional and statu tory objections and adopted it. Contract prices were re jected as a basis for regulation and the reserves to pro duction ratio was declared to be an inappropriate regu latory standard. The Commission set up a two-price sy tem. It differentiated between gas produced as the sol product of a well, referred to as gas-well gas, and gas pro duced in association with oil, known as oil-well gas c casinghead gas. One price was established for new ga well gas and the residue therefrom sold under contract made on or after January 1, 1961. A second price wa established for flowing gas which was defined to includ gas-well gas sold under contracts executed before th mentioned date, casinghead gas, and residue gas derive from either source. The January 1, 1961, date of divisio between new gas-well gas and old gas-well gas wa

[8] Docket No. AR61-1, 24 FPC 1121.
[9] Docket No. AR61-2, 25 FPC 942.
[10] Docket No. AR64-1, 30 FPC 1354.
[11] Docket No. AR64-2, 30 FPC 1354.

adopted because that was the approximate date when the industry became able to direct its exploration efforts toward finding gas-well gas as distinguished from finding gas as a by-product in the search for oil. For new gas-well gas the Commission fixed a rate of 16.5 cents per Mcf for the Texas Railroad Districts inclusive of state and local taxes and a rate of 15.5 cents per Mcf for the New Mexico counties exclusive of applicable state and local production taxes. For flowing gas the respective rates were 14.5 cents and 13.5 cents.

In determining these rates the Commission gave consideration to composite costs but treated the two categories of new gas-well gas and flowing gas differently. It said that the price of the former "was geared to the cost of finding and producing future gas supplies and as such was built up primarily from nationally published statistics and the questionnaire data." For flowing gas it said "our touchstone is the historical cost of gas being produced in the Permian Basin area."

The Commission required adjustment on an individual company basis from the stated prices to reflect differentials from the quality standards. These downward adjustments are determined "by the net cost of processing the gas to bring it up to standard." A downward adjustment is also required if the Btu content is less than 1,000 per Mcf and an upward adjustment is permitted if that content is above 1,050.

Small producers, defined as those making less than 10 million Mcf of jurisdictional sales annually, are exempt from the quality adjustments and from certain filing requirements.

The Commission set a minimum price of 9.0 cents per Mcf. Provision is made for special exemption from area rates. Refunds of excess collections are required on an individual company basis. The possibility of changes in area rates is recognized. A moratorium, until January 1, 1968, is declared on rate increases and indefinite escalation clauses are prohibited.

Three commissioners filed separate opinions. With one exception Commissioner O'Connor approved the results reached but said that "the contract price at which most producers are able and willing to operate is just and reasonable" and that "composite costs best serve as a check on average field prices to preclude significant price departures." He disapproved the Btu adjustment saying that an upward adjustment should be applied for all gas having a Btu content in excess of 1,000. Commissioner Ross was critical of accounting methods used and pointed out the need for simplification. He dissented from the division date between new and old gas-well gas. In his view the new gas-well gas price should apply to gas sold after the date of the Commission decision. Commissioner Black said that the allowed 12% rate of return on net investment "is very probably a generous one" but was justified by the special risk of finding substandard gas in the Permian Basin.

3. *Disqualification of Two Commissioners.*

The Continental Group of petitioners urges that Commissioner Black was disqualified to participate in the decision. The Independent Petroleum Association of America, (IPAA) complains of the participation of both

Commissioners Swidler and Black. The claim is that each of them had prejudged the issue of whether substantial competition existed among producers. Additionally, Commissioner Black is accused of personal bias against the producers. The charges stem from public addresses made in 1964.[12] No claim is made that either commissioner prejudged the ultimate issue of a just and reasonable rate. In our opinion no basis for disqualification arises from the fact or assumption that a member of an administrative agency enters a proceeding with advance views on important economic matters in issue. Nothing in the record disturbs the assumption that the two commissioners are "men of conscience and intellectual discipline, capable of judging a particular controversy fairly on the basis of its own circumstances."[13] The cases cited by Continental and IPAA are not in point.[14]

4. *Objections of Texas and New Mexico.*

The states of Texas and New Mexico, besides adopting the briefs and arguments of the Continental Group, assail the Commission decision on grounds peculiar to

---

[12] A motion for the disqualification of Commissioner Black was made to and denied by the Commission. We find no similar motion in the record pertaining to Commissioner Swidler.

[13] United States v. Morgan, 313 U.S. 409, 421. See also Federal Trade Commission v. Cement Institute, 333 U.S. 683, 700-703.

[14] In Texaco, Inc., v. Federal Trade Commission, D.C.Cir., 336 F.2d 754, vacated 381 U.S. 739, the charge was precommitment of a commissioner on the guilt of an accused. In Gilligan, Will & Co. v. Securities and Exchange Commission, 2 Cir., 267 F.2d 461, certiorari denied 361 U.S. 896, a similar charge was made against a commission. Amos Treat & Co. v. Securities and Exchange Commission, D.C.Cir., 306 F.2d 260, related to a charge against a commissioner who had previously served as a staff member in the investigation which led to the complaint.

them in their governmental capacity. They say that the public interest, which the Commission is required to protect, includes the producing states as well as the consuming states; that the prices which the Commission has set will cause a cessation or curtailment of exploration and development activities to the serious injury of the economy of the Permian Basin; that waste rather than conservation of a natural resource will result; and that the states and their public entities will suffer severe losses in taxes and royalty payments.[15] Similar arguments were made by West Virginia in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 607-614, and were rejected by the Supreme Court which said that when Congress passed the Natural Gas Act it "was quite aware of the interests of the producing states in their natural gas supplies" and that nothing in the Act intimates that high prices should be maintained so that "the producing states obtain indirect benefits." The rejection of the state's contentions in Hope requires the rejection of the same contentions here.

Texas and New Mexico also argue that the Commission has unlawfully interfered with their power of taxation. The Commission fixed the rates of gas produced in Texas to include all state taxes and in New Mexico to exclude such taxes. It said that: "In the event of any increase in taxes in Texas or New Mexico, the Commission will consider whether ceiling prices shall be increased and, if so, to what extent." The states' arguments

---

[15] In Texas 4.7 million acres of public lands are within the Permian Basin and in New Mexico over 3 million acres. Much of this land is leased for oil and gas and produces royalty income.

are premature. The Commission has allowed all present taxes as a cost item. Nothing in the Commission decision inhibits the states from increasing those taxes. The Commission has said that if they do, it will determine whether such increases should be passed on to the consumer or remain on the shoulders of the producers. The question of whether increased state taxes will unreasonably burden interstate comerce is hypothetical at this stage.

New Mexico complains that the establishment of a ceiling price plus existing taxes for gas produced in its portion of the Permian Basin denies to it the power to provide a tax incentive to producers by reducing the tax. The argument is not persuasive. If the New Mexico tax was reduced, the Commission could properly consider a rate decrease to reflect the tax decrease.

5. *Legality of Area Rates for Permian Basin.*

The problems confronting federal regulation of the natural-gas business, and particularly the independent producers, have been discussed several times[16] and need be only summarized. The interstate gas business is concerned with a wasting, nonreplenishable natural resource subject to production after discovery. At the point where the gas enters interstate commerce there are few buyers

---

[16] See opinions of Justice Jackson dissenting in Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 628, and concurring in Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 608; dissenting opinion of Justice Douglas in First Phillips, 347 U.S. 672, 687; dissenting opinions of Justice Clark in First Phillips, 347 U.S. 672, 690, and in Second Phillips, 373 U.S. 294, 315; dissenting opinion of Justice Harlan in Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137; 159; and Opinion No. 338 of the Commission, 24 FPC 537, 542-548.

and thousands of sellers. The producers range from the financially powerful integrated oil companies to the wildcatters who operate on a shoestring. Their results are measured by the amount of gas produced — not by the amount of money invested. Exploration and development costs are financed out of current income and are charged to expense rather than capital. The uncertainty of the business causes substantial cost and revenue fluctuations not only from producer to producer but also from year to year for the same producer. A regulated commodity, gas, is produced in substantial quantities along with an unregulated commodity, oil. The allocation of costs between them baffles the experts and presents the temptation to use mathematical means of arriving at a predetermined result. The same rate may bring a financial windfall to one producer and a financial disaster to another. The price of gas must be competitive with that of other sources of energy and must be sufficiently attractive to encourage a continued search for new supplies.

In Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 582, a case relating to pipeline rates, the Court held that the provisions of the Act were consistent with the due process clause of the Fifth Amendment and within the commerce power. Another pipeline case, Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 602, says that in fixing rates the Commission is "not bound by the use of any single formula or combination of formulae"; that "under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling"; and that the impact of the rate order rather than the theory behind

it is the governing criterion. The "end result" test of Hope was followed in Colorado Interstate Gas Co., v. Federal Power Commission, 324 U.S. 581, 605-606.

Second Phillips, 373 U.S. 294, holds that the Commission did not abuse its discretion in terminating the § 5 investigation of Phillips' rates and substituting an area basis for an individual company basis. The Court reaffirmed the principles announced in Natural, Hope, and Colorado Interstate, recognized the difficulties inherent in the regulation of the price of natural gas, shared the Commission's hopes for the success of the area approach, and observed that the "case might be different if the area approach had little or no chance of being sustained."[17] At the same time, the Court pointed out that "the lawfulness of the area pricing method" was not before it for review.[18] Four justices dissented in an opinion which characterized the area rate policy of the Commission as "a new, untried, untested, inchoate program which, in addition, is of doubtful legality."[19]

In Callery[20] the Court mentioned that the § 7 proceedings before it had at one time been consolidated with the South Louisiana area rate proceedings. Contrary to the argument of the California Distributors the Court did not, tacitly or otherwise, approve area rate regulation. The most pertinent comment is that of Justice Harlan in his concurring and dissenting opinion who said that area

---

[17] 373 U.S. 294, 310, 314.

[18] Id. at 308.

[19] Id. at 317.

[20] United Gas Improvement Co. v. Callery Properties, Inc., 382 U.S. 223, 225-226.

pricing "ultimately aims to simplify proceedings under the statute."[20a]

We cannot accept the arguments of the Commission and the California groups that the Supreme Court has determined the validity of area pricing under the Act. We read the decisions to mean that the Court has permitted the Commission to go forward with the area rate experiment and wishes it good luck in the development of a workable procedure which will be free from constitutional and statutory pitfalls.

Governmental price regulation of services and commodities on a group for geographical basis has been upheld in a number of decisions[21] under the federal commerce and war powers and under state police powers. Those supporting the Commission place great reliance on these decisions. The producers painstakingly distinguish each from the case at bar. We decline to be drawn into these tortuous sidepaths because we are convinced that the "translation of an implication drawn from the special aspects of one statute to a totally different statute is

---

[20a] Id. at 231.

[21] See The New England Divisions Case, 261 U.S. 184 (ICC - divisions of joint rates); Aetna Insurance Co. v. Hyde, 275 U.S. 440 (Missouri regulation of fire insurance rates); Tagg Bros. v. United States, 280 U.S. 420 (Packers and Stockyards Act of 1921); Nebbia v. New York, 291 U.S. 502 (New York Milk Control Act); United States v. Rock Royal Co-op., 307 U.S. 533 (Agricultural Marketing Agreement Act of 1937); Sunshine Anthracite Coal Co. v. Adkins, 310 U.S. 381 (Bituminous Coal Conservation Act); Bowles v. Willingham, 321 U.S. 503 (Emergency Price Control Act of 1942); New York v. United States, 331 U.S. 284 (ICC - railroad rates); and Ayrshire Collieries Corp. v. United States, 335 U.S. 573 (ICC - railroad rates).

treacherous business."[22] Specific reference need be made to only one decision. Several producers emphasize the statement in Bowles v. Willingham, 321 U.S. 503, 517, that in the Natural Gas Act "Congress has provided for the fixing of rates which are just and reasonable in their application to particular persons or companies." The argument is that by this language the Supreme Court has recognized that regulation under the Act is on an individual company rather than group basis. We do not agree. The statement is dicta and whatever value it might have had as dicta was, in our opinion, destroyed by the blessing which the Court gave area rate making in Second Phillips.

Producers urge that the language of the Act is contrary to regulation on a group basis because all pertinent references to natural-gas companies are in the singular. First Phillips holds that an independent producer is a "natural-gas company" within the purview of the Act. Section 2, the definitions section, provides that "person" means an individual or corporation, and defines "natural-gas company" to mean a person engaged in transportation or sale of natural gas in interstate commerce. Section 4, covering the filing and changing of rates, refers to "any natural-gas company," "no natural-gas company," "every natural-gas company," and "the natural-gas company." Section 5, authorizing investigation and determination of rates, refers to "any rate," by "any natural-gas company" and to "such natural-gas company." Section 7 provides for certificates of public convenience and necessity and uses the terms "a natural-gas company," "no natural-gas

[22] Federal Trade Commission v. Bunte Bros., 312 U.S. 349, 353.

company" and "such natural-gas company." The repeated use of the singular rather than the plural is said to require that the just and reasonable rate of each particular seller be tested with reference to its peculiar circumstances and operations.

Opposing arguments point out that the Act does not prohibit group or area rate making and that § 16 empowers the Commission to perform any and all acts and to prescribe such orders, rules, and regulations "as it may find necessary or appropriate to carry out the provisions of this act."

The basic query is whether the just and reasonable standard applies on an individual company basis or on a group basis. Section 4(a) says that "all rates * * * made * * * by any natural-gas company * * * shall be just and reasonable * * * ." If this means that each producer is entitled to a rate which will return its costs plus a reasonable profit, the inquiry is at an end because the Commission refused to receive individual cost figures.

The Natural, Hope, Colorado Interstate, and Second Phillips decisions all support the conclusion that in the regulation of natural-gas rates the Commission is not bound by any formula or method, and that the choice of the appropriate method for the determination of those rates lies in the sound discretion of the Commission. The appropriateness of the method depends on the peculiar characteristics of the natural-gas industry.

In its Opinion No. 338,[23] the Commission noted the reasons why the individual company cost-of-service

[23] 24 FPC 537.

method was inapplicable and unworkable. Among these were the lack of a fixed determinable relationship between investment and service to the public with the result that "a huge investment might yield only a trickle of gas, while a small investment might lead to a bonanza," the staggering allocation problems which could result in such anomalies as widely varying prices for gas coming from a jointly owned lease or even from a jointly owned well, and the intolerable administrative burden of requiring a separate rate determination for each of the several thousand independent producers.

The powerful contrary argument is that no area rate, whether based on composite costs, average aggregate costs or any other industry wide criteria, will suffice to assure a high cost producer of its costs to say nothing of a profit. We accept this as true.[24] The impact of an area rate in the natural-gas industry may have effects which cover the entire range from bonanza to bankruptcy. It is sufficient for us that these results were lucidly demonstrated in the dissenting opinion of Justice Clark in Second Phillips and did not deter the majority from allowing the Commission to proceed with its area rate program.

Some of the producers argue that if the Act is construed to permit area rate making, the Act is invalid under

[24] An appendix to the Hunt brief presents an array of natural-gas costs of 44 Permian producers whose volumes total over 208 million Mcf. Of these, 16 producing over 170 million Mcf are shown to have costs of less than 14.5 cents. The remainder have costs running from 14.77 cents to 216.05 cents. We have been unable to check the accuracy of these figures and mention them only to show the claimed disparity of costs. Continental says that "approximately 67 percent of the companies and approximately 30 percent of the volumes had costs above the industry average cost level."

Art. I, § 1, of the United States Constitution because no legislative standards have been set for establishing groups or making group determinations. Reliance is had on Panama Refining Co. v. Ryan, 293 U.S. 388, which held that a delegation of legislative power to the President was unconstitutional because Congress, among other things, "has declared no policy, has established no standard, has laid down no rule."[25]

Congress cannot delegate its power to enact laws but it can confer on an administrative agency the power to carry into effect laws which it has enacted.[26] In the New England Divisions Case, supra, the Court referred to the power given by Congress to the Interstate Commerce Commission to determine just and reasonable rates and said that Congress "intended that a method should be pursued by which the task * * * could be performed."[27] In Lichter v. United States, 334 U.S. 742, 785-786, the Court in discussing legislative standards said that the "standards prescribed by Congress are to be read in the light of the conditions to which they are applied" and for an example observed that "among those which have been held to state a sufficiently definite standard for administrative action [are] 'just and reasonable' rates for sales of natural gas."

In the regulation of the natural-gas industry "the actual necessities of procedure and administration"[28] have led to the adoption of the area rate method. We believe that

[25] 293 U.S. 388, 430.

[26] Crain v. First National Bank of Oregon, Portland, 9 Cir., 324 F.2d 532, 537.

[27] 261 U.S. 184, 197.

[28] Id. at 198.

neither constitutional nor statutory provisions prevent the use of that method and that the Commission did not abuse its discretion in adopting it. The more important and difficult question is that of the validity of the area rates which have been established. The controlling standard is the end result test of Hope. In our opinion, this test is accepted by, and reaffirmed in, the Second Phillips decision.

Some of the producers urge that the area rate method is not consistent with the characteristics of the industry and that contract prices satisfy statutory requirements because they have been reached through effective competition. The Commission considered and rejected the argument. It pointed to the history of price negotiations in the Permian Basin, to the urgent requirements of the pipelines, to the heavy percentage of sales by a few producers, and to the control of undisclosed and uncommitted gas reserves by a few producers. It concluded that the record fails to establish that a just and reasonable rate can be established through competition and that "the primary competition revealed by the record was among the pipelines to secure new gas supplies at higher prices." Commissioner O'Connor disagreed saying that "the contract price at which most producers are able and willing to operate is just and reasonable." His conclusion was that "profit oriented costs and supply oriented contracts do not, in the aggregate, depart in any significant manner from each other." We accept the conclusion of the Commission that competition has not been effective to fix a just and reasonable rate. It is supported by reasonable inferences from the record and they are binding on us.

Continental and Superior say that they were improperly denied an opportunity to be heard on the geographical propriety of the Permian Basin as a rate area. In its order instituting the proceedings the Commission eliminated the issue of the appropriateness of the area for rate making purposes.[29] The Commission may draw on its expertise to determine the ground rules for an investigation but in so doing may not deny a specific right.[30] The producers fail to convince us that any such denial has occurred here. The Permian Basin is a well known area. Unless prices are to be determined on a national basis, areas must be selected and defined. The Commission had two choices. It could first determine the national revenue requirement and divide that up among the areas or it could first determine the various rates so that in the aggregate they meet that requirement. We are unwilling to assume that when all the area proceedings are completed the total revenue will not equal the national requirement. If it does not, both the producers and the consumers will suffer. In our opinion the Commission acted reasonably in selecting the Permian Basin for an area rate proceeding.

6. *The Two-Price System.*

The Commission's two-price system is vigorously attacked on many fronts. It will be remembered that one price is fixed for new gas-well gas and another for flowing gas. All agree that gas is a commodity which is valuable as a source of energy. The householder does

[29] 24 FPC 1121, 1122.

[30] Amax Petroleum Corporation v. Federal Power Commission, 10 Cir., 350 F.2d 92, 94.

not care whether the gas which burns at the tip of his appliance comes from a gas well, an oil well, or as a residue product. To him gas is gas.

The justification for the two-price system is that the higher price for new gas-well gas provides an incentive to explore for and develop new supplies. The producers do not question the finding that "the industry is increasingly becoming able to direct its exploration efforts toward finding new gas-well gas as distinguished from finding gas as a by-product in the search for oil." This ability may be confined to the larger companies which maintain the technical staffs skilled in making the necessary predictions. The smaller producers are in a less advantageous position. They may be relegated to the farmouts which the majors pass down to them or to operations in accord with their less scientific but sometimes financially rewarding hunches.

New gas discoveries are well said to be the life blood of the industry. The consumers may reasonably be required to pay the price needed to bring forth such discoveries. If an incentive price based on current costs is used for all gas, windfalls will be assured to many producers of old gas developed under lower historical costs and often found in association with oil.

The producers say that a single-price system based on current costs is required because revenues for current exploration and development must be internally generated from sales of gas from whatever source. The Commission rejected the argument. The question is not so much the source of the funds as it is the inducement to use available funds in the search for gas. The higher

price for new gas is intended to supply that inducement. Although the adequacy of the inducement can only be tested by future developments, we are not convinced that the refusal of the Commission to include the same inducement in the price of old gas, with the resulting likelihood of windfalls, was unreasonable.

Continental, Phillips, and others argue that the two-price system amounts to entrapment because of the possibility of reduction in price after financial commitments have been made. Although the Commission which announced the Permian Basin decision cannot bind a future Commission, we credit the Commission with good faith. The possibility of a change does not invalidate the rate method employed. When and if a reduction occurs, the argument of entrapment can be heard.

The division date of January 1, 1961, for the different prices of new gas-well gas and old gas-well gas is another subject of dispute. Here the Commission found as a fact that the appropriate date was the approximate time when directional drilling came to be used effectively. Under the evidence the selection of a division date was an administrative problem calling for the exercise of judgment. In making its choice the Commission acted within the evidence and within its powers. On rehearing, the Commission left open for future consideration the problem arising when new gas-well gas is developed from committed acreage. We assume that this problem will be met fairly when it comes to a head.

The two-price system is an outgrowth of directional drilling for gas. Its purpose is to assure a continued gas supply. The Commission frankly says that the adoption

of the system for the Permian Basin "should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies." We find no persuasive reason why the test should not be made.

7. *The Cost Information.*

In arriving at the Permian Basin rates the Commission used many sources of cost information. These included responses to questionnaires sent to producers, the Census of Mineral Industries for 1958, the Chase Manhattan Bank's 1961 Annual Analysis of the Petroleum Industry, the World Oil Magazine, the Oil and Gas Journal, the Joint Association Survey,[31] and others. The producers attack these sources on many and varied grounds. The range of objections runs from hearsay evidence through deprivation of right of cross-examination to denial of procedural due process. To take up each of these objections would increase the length of this opinion to encyclopedic dimensions.

From the information so obtained the parties, the staff, and the Commission make many computations and reach many results. The assumptions, allocations, formulae, equations, averages, means, and massive calculations may intrigue a mathematician or statistician but they have no attraction for us. We respectfully decline to be drawn into such a turmoil of numbers. We cannot in a few months unravel the snarl of statistics developed in the years of hearings. In our opinion the judicial process,

---

[31] This is a survey of a few producers conducted by the American Petroleum Institute, the IPAA, and the Mid-Continent Oil and Gas Association.

in cases such as this, should be confined to consideration of errors of law. We leave to the experts the selection of source material and the calculations to be made therefrom. Our concern is with the result.

8. *The Commission's Price Determinations.*

The Commission said that "costs must be a major factor in determining the area price." On the basis of current national statistics plus questionnaire data it determined the 1960 Mcf cost of new gas-well gas thus:

Exploration and Development Costs	
Dry Holes	1.42 cents
Other Exploratory Costs	1.59
Adjustment for Exploration in Excess of Production	1.11
Production Operating Expense	2.70
Net Liquid Credit	(3.10)
Regulatory Expense	.14
Depletion, Depreciation, and Amortization of Production Investment Costs	
Successful Well Costs	2.88
Lease Acquisition Costs	.76
Cost of Other Production Facilities	.31
Return of Production Investment (at 12%)	5.21[32]
Return on Working Capital	.35
Subtotal	13.37
Royalty at 12½ percent	2.05
Production Taxes	1.01
Total	16.43

[32] This is computed as follows: The production investment is the sum of successful well costs, lease acquisition costs, and cost of other production facilities or a total of 3.95 cents. It is to be recouped over an average period of 10 years beginning an average of one year after investment. Accordingly, the return is allowed on an investment base 11 times the production investment of 3.95 cents per Mcf or 43.45 cents. 12% of this figure is 5.21 cents per Mcf.

The Commission rounded this figure off at 16.5 cents for the Texas production. Because the New Mexico figure is exclusive of taxes a reduction of one cent was made in the New Mexico price.

For the costing of flowing gas the Commission used historical data developed by the industry questionnaires. The results may be summarized thus:

Production operating expenses	1.75 cents
Depreciation, depletion and amortization	2.42
Return at 12%	4.99
Exploration and development	4.08
Regulatory expense	.14
	13.38
State production tax at 7%	1.01
	14.39[33]

This figure was rounded off at 14.5 cents for Texas and 13.5 cents for New Mexico. As a check on the method used the Commission back-trended the new gas-well gas figures and arrived at a 14.64-cent price.

The rates so established are subject to downward adjustment because of quality deficiencies and to both downward and upward adjustments on the basis of Btu content. The Commission disclaims any intent that the rate figures show producer costs. It says that the price of new gas-well gas is "geared" to costs derived from national statistics and the questionnaire data and that for flowing gas the "touchstone" is the historical price of Per-

[33] No separate item was included for royalty payments because costs were computed on ⅞ of actual volumes.

mian gas.[34] Other undefined and unidentified "factors" were taken into consideration.

9. *The Moratorium.*

The Commission implemented the price provisions of the decision in various ways. It imposed a moratorium on rate increases until January 1, 1968, "except in compliance with a specific order of the Commission for a rate as determined pursuant to said proceeding [AR61-1] or pursuant to later order of the Commission." The producers say this violates the Act because § 4 permits filings for rate increases. Section 4 must be read with other sections of the Act. Section 5 authorizes the Commission to determine the just and reasonable rate "to be thereafter observed and in force." Section 16 gives the Commission power to make such orders "as it may find necessary or appropriate to carry out the provisions of this act." In Callery the Court held that there was ample power under § 7(e) to impose a moratorium.[35] We believe that there is also ample power under §§ 5(a) and 16. The reasonableness of the exercise of the power is established by the need for price stability, the Commission's expressed willingness to reopen the proceedings to consider the propriety of changes, and the expiration date which is only about a year off.

10. *The Escalation Clauses.*

The Commission's order forbids the filing of rate changes in excess of applicable area rates when the con-

---

[34] In Opinion No. 468 the Commission said: "Nevertheless, we make clear that we do not confine ourselves to a cost calculation in determining just and reasonable rates."

[35] 382 U.S. 223, 228.

tractual, right thereto is based on indefinite escalation clauses not permitted by § 154.93(a), (b), and (c) of the Regulations under the Natural Gas Act. The producers say that this provision destroys existing contract rights. The Commission replies that it has not proscribed the clauses but merely the right to file under them. This is a thin distinction. In Pan American Petroleum Corporation v. Federal Power Commission, 10 Cir., 352 F.2d 241, 245, we upheld § 154.93 and pointed out that if a producer felt aggrieved thereby it could apply for a rule waiver under § 1.7(b) of the Commission's Rules of Practice and Procedure. We assume that a similar request could be made under the Permian order. When the request is made and rejected, the time will arrive for the consideration of the constitutional questions which the producers raise.

11. *The Commission's Fair Relationship Standard.*

In fixing the amounts of the area rates the Commission rejected the end result test and adopted a fair relationship standard. This appears clearly from Opinion No. 468-A. After disclaiming that it had made any finding that "jurisdictional revenues will equate to jurisdictional costs," the Commission said:

> "* * * we are convinced that the record fully justifies the Commission's judgment that the ceiling prices we have fixed 'provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur' in the Permian Basin."

Hope says that in the fixing of just and reasonable rates there must be a "balancing of the investor and the consumer interests."[36] It goes on to say that from the com-

[36] 320 U.S. 591, 603.

pany point of view the revenue must not only provide operation expense but also capital costs including "service on the debt and dividends on the stock"; and that the return to the equity owner must be commensurate "with returns on investments in other enterprises having corresponding risks" and "sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital."[37] The Court concluded the discussion of this problem with the observation that in Hope the "end result" could not be condemned as unjust and unreasonable.

In Colorado Interstate Gas Co. v. Federal Power Commission, 324 U.S. 581, 605, the Court, after referring to the Natural and Hope decisions said:

> "In those cases we held that the question for the courts when a rate order is challenged is whether the order viewed in its entirety and measured by its end results meets the requirements of the Act."

Also pertinent is the statement of the Court in Second Phillips that:[38]

> "To whatever extent the matter of costs may be a requisite element in rate regulation, we have no indication that the area method will fall short of statutory or constitutional standards. The Commission has stated in its opinion in this proceeding that the goal is to have rates based on the 'reasonable financial requirements of the industry' in each production area, * * * and we were advised at oral argument that composite cost-of-service data will be considered in the area rate proceedings."

Nothing in Second Phillips rejects the end result test of Hope. We believe that it applies here and that it is not

[37] Ibid.

[38] 373 U.S. 294, 309-310.

satisfied by a finding of fair relationship. Something more than mere semantics is involved. The determination of a fair rate from the standpoint of the consumers must depend to large extent on the informed judgment of the regulatory agency. In these proceedings no distributor, consumer interest, or consumer representative objects to the rates. They are accepted as just and reasonable.

From the standpoint of the producer the situation is different. It is entitled to recover its prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. These requirements must be tested against the record. They may not be brushed aside with a general finding of fair relationship. The Commission concedes that it did not equate jurisdictional costs to jurisdictional revenues. This is obvious because no determination was made of the jurisdictional revenues which the rates will produce.

12. *The High Cost Operator and the Small Producer.*

The Commission broke down the rates into components which it justified on averages based on national statistics and questionnaire data. We recognize that weighted averages and sifted averages are suspect.[39] We accept the principle that both the basic figures and the averages obtained therefrom must be typical and representative but we are not convinced that the Commission has misused its expertise in this technical field. It is self-evident that when average costs are used to compute ceiling prices, the high cost operator will be hurt and some low cost operators may receive windfalls. Probably

[39] See United States v. Abilene & Southern Railway Company, 265 U.S. 274, 291, and Interstate Commerce Commission v. Mechling, 330 U.S. 567, 583.

to a greater extent than in any other comparable segment of the national economy the element of chance can affect the success or failure of even the most prudent entrepreneur who engages in the natural-gas business.

The problem of the high cost operator is characteristic of group or area rate making. The Supreme Court upheld group rates in Acker v. United States, 298 U.S. 426, 431, and commented that "regulation cannot be frustrated by a requirement that the rate be made to compensate extravagant or unnecessary costs." In Tagg Brothers v. United States, D.C.Neb. 29 F.2d 750, 755, affirmed 280 U.S. 420, the court said that it was not necessary "to fix the rates so high that all agencies in the business would make money." Covington & Lexington Turnpike Road Company v. Sanford, 164 U.S. 578, 596, says that "the public cannot properly be subjected to unreasonable rates in order simply that stockholders may earn dividends."

The small producers, represented here by Big Chief Drilling Company, IPAA, Texas Independent Producers & Royalty Owners Association (TIPRO), J. C. Barnes, and others, join in the prediction that the Permian decision sounds the death knell of the small producers. Perhaps the flamboyant wildcatter must be replaced by the scientists of the industrial giants but the efforts of the boom-or-bust adventurers have contributed greatly to natural-gas discoveries. In its decision the Commission referred to the "smaller independent who traditionally drills much of the Permian exploratory acreage" and said that: "Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators who con-

tribute a large share of the discoveries of new sources of gas."[40]

The Commission took note of the suggestions that small producers should be exempt from regulation.[41] It found that outright exemption was neither necessary nor desirable but said that the small producers needed "special treatment." To this end it defined a small producer as "a natural gas company selling jurisdictionally less than 10,000,000 Mcf annually on a nationwide basis." They were granted relief from various requirements of §§ 7 and 4 and were freed from rate adjustments because of quality differentials. In our opinion the classification is reasonable and within the Act.

The small producers do not seek complete exemption. Their attitude is that such relief would be illusory rather than real because the pipelines would not pay more for gas supplied by them than the price paid to the major companies. Their complaint is that the Commission did not give adequate consideration to small producers' costs.

Data covering the costs of Permian producers came from questionnaires which are classified as Appendix B and Appendix C. The Appendix B group was mandatory for producers with company-wide jurisdictional sales of over 10 million Mcf and optional for others.[42] The

---

[40] Big Chief asserts that the small producers, although credited with only 20% of current production volumes, actually drill almost 40% of all successful gas wells and 50% of all successful exploratory gas wells.

[41] See statements of Justice Clark dissenting in Second Phillips, 373 U.S. 294, 329-330, and speaking for the Court in Federal Power Commission v. Hunt, 376 U.S. 515, 527.

[42] Appendix A pertained to well and drilling statistics. It is not pertinent here.

Appendix C questionnaires went to the small producers. Forty-two of the majors and 25 of the small producers answered Appendix B. The response to the Appendix C questionnaires was sporadic. The Commission used only the material supplied by the majors saying that the inclusion of the data supplied by the small producers "does not affect the results.".

TIPRO and Big Chief both emphasize the testimony of a staff witness that the small producer questionnaire showed average unit costs 2 cents per Mcf higher than those of the majors. They argue that the end result standards must be applied not only to the entire group but to them as a group. The weakness of the argument is that once the whole group is split the process can be carried on until the regulation is back on an individual company basis.

We do not know the answer to the small producer problem. Superficially it seems unfair to fix ceiling prices for all producers, both large and small, on the basis of the costs of large producers only. The Commission rejected the small producer data because in its opinion the impact on the rate structure was de minimis. On the record presented, we are unwilling to say that this conclusion was erroneous as a matter of law.

In any regulation of the natural-gas industry on an area basis the high cost producers, be they majors or little fellows, are certain to be placed in a position less advantageous than that occupied by those whose good fortune and able management have supplied a lower cost base. We agree with the Commission that the expense items included in an individual cost-of-service are not

the measure of a confiscatory rate. A producer has no constitutional right to be reimbursed for dry-hole expenses.[43] Also it has no obligation to remain in business by replenishing the supplies of gas which form the basis of present obligations. Inability to continue exploration and development is not confiscation. We conclude that the impact of the Permian rates on the high cost producers does not destroy the area rate method.

13. *Gathering and Processing Costs.*

One subject of much discussion in the briefs is the allowance of the same rate for gas delivered at the tailgate of a processing plant and for gas delivered at the wellhead. Gathering lines cost money and have to be built and operated by someone. The Commission's position is that the revenues received for oil and oil products derived from condensation and processing return a profit which induces the building of the needed gathering lines and plants. Here again we reach the troublesome field of cost allocations between a regulated commodity, gas, and unregulated commodities, oil and liquified petroleum products.

Bass places particular emphasis on this phase of the case. It points to its extensive investments in gathering lines and plants and to its permanently certificated rate of 18 cents which, it says, the Commission has never specifically found unreasonable or discriminatory. The answer as we see it is that if area rates are proper no greater need exists for the consideration of the individual cost and revenue requirements in the case of Bass than

[43] Cf. Columbus Gas & Fuel Co. v. Public Utilities Commission of Ohio, 292 U.S. 398, 407.

in the case of the other producers. Perhaps in the future courts will have to explore the mysteries of allocations but we are not so inclined in this case. If in fact Bass and others similarly situated are confronted with confiscation, a way must be open for them to be heard.

14. *Special Exemptions.*

The Commission recognized that some provision must be made for special exemption from area rates. It said that when a producer's "out-of-pocket expenses in connection with the operation of a particular well are greater than the revenues under the applicable area price, he should be entitled to appropriate relief." It declined to "specify all of the special circumstances which may serve as a basis for exceptions to the area rate" and observed that failure to earn exploration and development expenses plus the allowed return does not amount to confiscation. In regard to the form of relief it held that "it may be sufficient to permit them to abandon their unprofitable sales."

We agree with the Commission that an escape clause cannot be used to convert an area rate into an individual company cost-of-service rate but an escape clause which does no more than prevent an unconstitutional confiscation amounts to nothing. None is needed for that purpose. The producers are right in saying that the Commission's exemption provisions are so vague and nebulous that neither they nor a court can determine what relief is being granted. Out-of-pocket expenses are not defined and we do not know what they include. If a producer's accounting is on a lease rather than well basis, the facts relating to a particular well might not be determinable.

It may be going too far to say categorically that individual producers should be permitted to show that the group costs are not typical or representative of their costs but in some instances that should be permitted. Conservation of gas is promoted if marginal wells are allowed to continue to produce but is discouraged if the same wells are shut down by a low price. Some producers furnish gathering facilities. Others sell at the wellhead and the pipelines pay for the gathering. Gathering costs are allowed pipelines. Perhaps in some instances they should be allowed to producers. An adequate savings clause should contain guidelines which if followed by an aggrieved producer will permit it to be heard promptly and to have a stay of the general rate order until its claim for exemption is decided. It is not enough to say in effect that confiscation will be prevented. Confiscation is an individual proposition and the individual is entitled to be heard. We are convinced that the Commission's special exemption provisions are inadequate.

15. *Quality Standards.*

The Commission provided for adjustments in the area rates to reflect quality differentials. It said that "the price of gas cannot be related to volume alone but must be related to units of energy free of impurities and sufficiently compressed to enter the pipeline." Standards were fixed for content of carbon dioxide, hydrogen sulphide, total sulphur, water, and other impurities; and the amount of delivery pressure was established. The applicable base area rate is adjusted downward by the net cost of processing the gas to bring it up to standard. Provision is made for both an upward and a downward adjustment of rate depending on the Btu content. Quality

statements are required to be filed together with an agreement by the seller and the buyer covering the cost of bringing the gas up to standard. If an agreement cannot be reached, each shall file a statement of its views on the processing costs.

About 90% of the flowing gas is substandard. We are cited to no figures on the similar percentage of new gas-well gas. The amount of the rate adjustments does not appear in the record because there was no evidence of the extent of quality differentials or of the processing costs of bringing the gas up to standard.[44] At oral argument various estimates were given as to the amount of rate reduction which would result from substandard quality. These were based on statements filed pursuant to the decision but after the record was closed. They ranged from .7 cents to 2.0 cents per Mcf. A spokesman for the Continental Group said that on 1960 volumes a revenue deficiency of some $12 million a year would result. The Commission response in this court to the Skelly motion for stay of the Commission's orders herein said that the reductions in applicable rates because of adjustments for quality standards are expected to result in a revenue reduction of about $10 million annually.[45]

The producers' argument that the imposition of quality standards violates procedural due process because of lack

[44] The Commission says in its brief that "appropriate price differentials or adjustments could not be made on the basis of the record."

[45] The statement was this: "It has been estimated that the reductions to the base rates alone will reduce the revenues from jurisdictional Permian sales by about $10 million annually. The adjustments for quality standards, which were substantially altered by Opinion 468-A * * * are expected to result in a further reduction of the same magnitude."

of notice need not be resolved at this time. We are remanding the case and now everyone has notice. The matter of the Btu adjustments presents a particular problem which was emphasized by Commissioner O'Connor in his dissent. The price goes down if the Btu content is below 1,000 and goes up if it is above 1,050. The producers say the adjustment upward should begin at 1,000. We do not understand the Commission's reasons for the gap. On remand this can be clarified.

16. *The Rate of Return.*

The Commission says that the impact of the quality adjustments is taken care of in the rate of return which is made generous on this account. It fixed a rate of return of 12% on production activities and held that such rate "protects gas consumers against excessive prices but it is not so low that it fails to respond to the needs of the industry." The principles applicable to the determination of an appropriate return are set forth in Bluefield Water Works & Improvement Co. v. Public Service Commission, 262 U.S. 679, 692-693. It "must be determined by the exercise of a fair and enlightened judgment, having regard to all relevant facts." The rates of a public utility should "permit it to earn a return on the value of the property * * * equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties" but the utility has no constitutional right to profits realized by "highly profitable enterprises or speculative ventures." The return should assure "confidence in the financial soundness of the utility" and be adequate under prudent management "to maintain and support its credit and en-

able it to raise the money necessary for the proper discharge of its public duties." The Hope decision[46] states the same basic principles.

The Commission recognized these controlling principles. The objections of the producers are to the point that the allowed rate of return is inadequate to enable the industry to attain the goals which the principles contemplate. At this time there is no need for us to go into the comparisons of the returns appropriate for producers as opposed to pipelines or to the financing methods employed by either. The fact is that by treating quality deductions as a risk rather than a cost the Commission has made it impossible to determine the amount of return with any degree of certainty. The difficulty is that the record does not disclose the amount of deductions.

A fair rate of return cannot be ascertained with mathematical certainty.[47] Pragmatic adjustments may be made by an agency within the ambit of its statutory authority.[48] A court must put great reliance on agency expertise in evaluating a rate of return but this does not mean that a court must accept the agency determination in blind faith. A producer is entitled to a higher rate of return than a pipeline because of the greater risk of the business. The Commission has here compounded the risk of discovery with the risk of substandard quality.

We believe that the price reductions to reflect quality deviations are an item of cost rather than an item of risk

---

[47] Colorado Interstate Gas Co. v. Federal Power Commission, 10 Cir., 142 F.2d 943, 961-962, affirmed 324 U.S. 581.

[48] Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 586.

and should be directly reflected in the applicable base rates instead of hidden in a rate of return allowance. The amount of cost is the expense of bringing the quality up to standard. In the Permian Basin sound reason exists for this conclusion because of the known and substantial quality deficiencies particularly in flowing gas production. We find it hard to understand why a revenue deficiency in the estimated amount of $10 million annually should be classified as a risk and not a cost. A risk occurs as the result of unknown or unconsidered contingencies. In the Permian Basin it is known and considered that flowing gas falls short of pipeline standards. In any event, the lack of evidence as to quality deductions makes it impossible to determine whether the rate of return satisfies the Bluefield and Hope principles and we have no basis on which to appraise the allowance made by the Commission. We respect the expertise of the Commission but the conclusions reached by the use of expertise must accord with legal standards.

17. *Contract Limitations.*

The producers say that recovery of industry costs under the area rates is impossible because many of the existing contracts do not permit a producer to file for the flowing gas ceiling price of 14.5 cents. The Commission recognized that "there undoubtedly will be some contract prices lower than the area rate ceiling, as adjusted for quality." Some of the producers estimate the deficiency because of contract limitations to be $14.4 million in the test year of 1960. The Commission has estimated that a reduction of base rates alone will result in a revenue reduction of about $10 million annually.[49]

[49]See supra, note 45.

It is elementary that gas prices are originally set by contract between the producer and the pipeline, that the producer may not raise the price unilaterally, and that any increase in price must be within contract terms unless the price is set so low as to affect the public interest. The Commission says that the producers are not entitled as a matter of right to collect contract rates that are higher than otherwise reasonable in order to offset other rates limited by contract to below maximum reasonable levels. Regulation does not guarantee an over-all profit;[50] relief from an unduly low rate may be given only if the rate is "so low as to adversely affect the public interest — as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory";[51] and a company's losses in one instance do not justify an illegal gain in another instance.[52] At the same time in such group procedures as the division of railroad rates the Interstate Commerce Commission, with court approval, has recognized that revenue from one source may balance that from another.[53]

Contract limitations are one of the facts of life for the natural-gas industry. They are the outgrowth of the days when gas, which had previously been vented, flared, or capped, became salable to the newly constructed inter-

---

[51] Federal Power Commission v. Sierra Pacific Power Co., 350 U.S. 348, 355.

[52] Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, 153.

[53] See New England Divisions Case, 261 U.S. 184.

state pipelines. The pipelines wanted long-term contracts and the producers wanted to sell their gas. Prices were low. With the phenomenal increase in the use of gas as an energy source the prices rose. The producers whose contracts either contained no escalation clauses or clauses of the type proscribed by the Commission were in a disadvantageous position. Even permissible escalations do not, in many instances, bring the 1960 price up to the area ceiling. In Second Phillips the Court upheld the termination of certain § 4(e) dockets on the Commission's finding that "the annual increase in revenue produced by these increased rates was substantially less than the deficit for the test year 1954."[54] The same situation exists here for many companies. We do not know whether it exists for the area producers as a group because no finding was made of revenue and requirements. The Supreme Court has said that losses in one instance do not justify illegal gains in another. To us this means that the contract limitations do not preclude the establishment of a just and reasonable area rate. The answer is provision for a minimum rate.

The Commission held that "the establishment of minimum rates in this case is in the public interest and that the price impact on the consumer will be de minimis." It established a minimum rate of 9 cents per Mcf for gas of standard pipeline quality. We believe that the controlling question is whether the proper revenue requirements of the area producers as a group can be satisfied with rates having the ceiling and the floor which the Commission has fixed. This cannot be answered because

---

[54] 373 U.S. 294, 305.

the financial impact of the quality deductions is not ascertainable from the record.

18. *Refunds.*

The revenue deficiency argument of the producers leads directly to the refund issue. The Commission required "appropriate refunds in the case of rates which are the subject of proceedings under Section 4(e) of the Act, and have thus been collected subject to an obligation to refund amounts collected in excess of the just and reasonable rates as here determined." Procedures to accomplish this result were set up in detail.

The producers say that these individual company refunds are not proper because of the revenue deficiency of the industry. They say that in the test year of 1960 the producers in the area failed to meet their revenue requirements by $14.4 million and they estimate the refunds for that year under the Commission decision to approximate $6 million.

The Examiner held that refunds should be ordered only to the extent that over-all industry revenues exceed over-all industry expenditures in a given year. The Commission said that this theory was unworkable because it would result in inequities among both the buyers and the producers and because of "insurmountable" administrative difficulties. We are at a loss to understand how refund obligations, which might come into existence under the Examiner's approach, would be divided among the producers.

We see no escape from the requirement that refunds be on an individual company basis and on a schedule by

schedule basis. As we understand Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, 153, refunds are appropriate for each excessive rate regardless of over-all revenues. The Commission has required refunds only on § 4(e) rate increases above the applicable area ceiling. If a producer claims that the refunds required of it are confiscatory or harmful to the public interest, it must have an opportunity to petition for special relief. A similar opportunity must be afforded if a producer can show that a refund is required for collections at or below the "last clean rate."[55] An adequate special exemption clause can take care of such situations.

19. *The End Result Test.*

This brings us back to the end result test. The Continental Group, which includes many large producers and major integrated oil companies and which is supported by Phillips, presents alternative arguments. The first is economic. It is said that regulation under the Act must be consistent with the economic characteristics of the industry; that this requires the establishment of market prices based on contracts; that a cost-based system of regulatory rates does not recognize the responsiveness of the gas supply to gas prices; and that a producer does not explore on the expectation of a return of its cost plus a return on its investment but on the hope of getting back many times what it expends as a reward for its gambler's risk. No doubt these are the economic facts of the industry.

---

[55] By "last clean rate" is meant the last rate in effect pursuant to a permanent certificate not subject to any refund obligation.

The divorce of commodity value from costs was suggested by Justice Jackson in his dissent in Hope. He commented that a producer would have difficulty showing the invalidity of a fixed commodity value so long as it voluntarily continued to sell its product in interstate commerce.[56] One difficulty with this suggestion is that once the gas is committed no withdrawal from interstate movement is possible without Commission approval.[57] A producer can stop exploration and development if it is dissatisfied with price but the interstate sales go on with a continuing impact of cost on price and of price on exploration and development. In any event the majority rejected the proposal and held that under the just and reasonable standard of the Act a regulated company is entitled to revenue for operating expenses and capital costs and to a return "commensurate with returns on investments in other enterprises having corresponding risks."[58] These standards cannot be met without consideration of costs and revenues. In our opinion the Hope construction of the statutory standard casts serious doubts on the validity of the adoption of a contract-based commodity value.

The alternate argument of the Continental Group is that if the rates are to be determined on a composite cost-of-service basis, the revenue requirements of the industry must be found and rates fixed to meet those requirements. In Second Phillips the Court particularly noted the assurance of the Commission that "composite cost-of-service

---

[56] 320 U.S. 591, 652.

[57] Section 7(b) of the Act. See also Sunray Mid-Continent Oil Co. v. Federal Power Commission, 364 U.S. 137, 156.

[58] 320 U.S. 591, 603.

data will be considered in the area rate proceedings."[59] Consideration of such data does not eliminate consideration of other factors. At the same time Second Phillips did not reject the end result test of Hope. Instead it quoted a portion of that opinion which said among other things that "it is the result reached not the method employed which is controlling."[60]

The Commission rejected both alternatives of the Continental Group. It said that commodity value established by contracts may not be used because of the absence of effective competition; and it emphasized that it took into consideration factors other than costs. The record does not disclose what these other factors were but they must have had some economic basis. The Commission held that its ceiling prices provided a "fair relationship" between consumer prices and producer costs. Fair relationship is pertinent but it is only part of the end result test. We do not know the producers' costs or revenue requirements. We do not know the economic factors which either require or permit departure from costs and revenues. The end result test is not satisfied by a reliance on unknowns.

We have accepted the Commission's conclusion that contract rates should not be used. The trouble is that the Commission decision rides two horses and we have no way of knowing the outcome of the race. It uses composite cost-of-service evidence, engrafts economic factors on top, and comes out with a rate which it justifies on a fair relationship basis. We have the problem of how in such circumstances a court can determine whether the

[59] 373 U.S. 294, 310.

[60] Id. at 309.

just and reasonable standard of §§ 4 and 5 has been met. The answer is not found in the record before us.

The facts sustaining the conclusion of fair relationship must be found. The Commission did not make those findings and indeed it could not have done so because of the failure of the record to disclose the revenue impact of the adjustments in area rates to reflect quality differentials. Whether rate reductions because of quality deficiencies are a risk or a cost, the answer comes out the same. If they are a risk, we do not know the rate of return. If they are a cost, we do not know whether the revenue received will equal the reasonable revenue requirements. We believe that under Hope, and under Second Phillips, the area producers, as a group, are entitled to recover their prudent operating expenses and capital costs with a return commensurate to the risk and sufficient to attract capital. Satisfaction of this requirement must appear through appropriate findings based on substantial evidence. These cannot be made on the record presented. The decision of the Commission is not saved by the special exemption provisions which we find to be insufficient and unsatisfactory.

Rate making under the Act has produced a superabundance of delay and litigation. Much gas has moved through the pipelines since the First Phillips decision. We wonder if the time has not come for the establishment of a better rapport among the Commission, the consumers, the distributors, the pipelines, and the producers. Some practical means of resolving the economic and legal issues is highly desirable. The Commission has approved many settlements. The use of this procedure may well

be explored further in an effort to obtain a true "balancing of the investor and the consumer interests."[61]

One point remains to be mentioned. Eleven motions for leave to adduce additional evidence were filed with us by various producers. We deferred all to the hearing on the merits. In view of the disposition which we make of the cases we see no reasons to explore evidentiary problems which may arise on remand. The Commission will hold such additional hearings as are needed to determine the effect of the quality adjustments, and to determine the group revenues and the group revenue requirements. It will make appropriate findings on these matters. The order based thereon shall contain an adequate provision for special exemptions. We decline to make advance rulings on the procedures to be followed or on the evidence to be received.

The motions to adduce additional evidence are severally denied. The petitions to review are severally granted and the cases are all remanded to the Commission for further proceedings consistent with this opinion.

---

APPENDIX B

Rates And Charges; Schedules; Suspension Of New Rates

Sec. 4. (a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

(b) No natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.

(c) Under such rules and regulations as the Commission may prescribe, every natural-gas company shall file with the Commission, within such time (not less than sixty days from the date this act takes effect) and in such form as the Commission may designate, and shall keep open in convenient form and place for public inspection, schedules showing all rates and charges for any transportation or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges, together with all contracts which in any manner affect or relate to such rates, charges, classifications, and services.

(d) Unless the Commission otherwise orders, no change shall be made by any natural-gas company in any such rate, charge, classification, or service, or in any rule, regulations, or contract relating thereto, except after thirty days' notice to the Commission and to the public. Such notice shall be given by filing with the Commission and keeping open for public inspection new schedules stating plainly the change or changes to be made in the schedule or schedules then in force and the time when the change or changes will go into effect. The Commission, for good cause shown, may allow changes to take effect without requiring the thirty days' notice herein provided for by an order specifying the changes so to be made and the time when they shall take effect and the manner in which they shall be filed and published.

(e) Whenever any such new schedule is filed the Commission shall have authority, either upon complaint of any State, municipality, State commission, or gas distributing company or upon its own initiative without complaint, at once, and if it so orders, without answer or formal pleading by the natural-gas company, but upon reasonable notice, to enter upon a hearing concerning the lawfulness of such rate, charge, classification, or service; and, pending such hearing and the decision thereon, the Commission, upon filing with such schedules and delivering to the natural-gas company affected thereby a statement in writing of its reasons for such suspension, may suspend the operation of such schedule and defer the use of such rate, charge, classification, or service, but not for a longer period than five months beyond the time when it would otherwise go into

effect; and after full hearings either completed before or after the rate, charge, classification, or service goes into effect, the Commission may make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective. If the proceeding has not been concluded and an order made at the expiration of the suspension period, on motion of the natural-gas company making the filing, the proposed change of rate, charge, classification, or service shall go into effect. Where increased rates or charges are thus made effective, the Commission may, by order, require the natural-gas company to furnish a bond, to be approved by the Commission, to refund any amounts ordered by the Commission, to keep accurate accounts in detail of all amounts received by reason of such increase, specifying by whom and in whose behalf such amounts were paid, and, upon completion of the hearing and decision, to order such natural-gas company to refund, with interest, the portion of such increased rates or charges by its decision found not justified. At any hearing involving a rate or charge sought to be increased, the burden of proof to show that the increased rate or charge is just and reasonable shall be upon the natural-gas company, and the Commission shall give to the hearing and decision of such questions preference over other questions pending before it and decide the same as speedily as possible. [52 Stat. 822 (1938); 76 Stat. 72 (1962); 15 U.S.C. § 717c]

Fixing Rate And Charges; Determination Of Cost Of Production Or Transportation

SEC. 5. (a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any

State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: *Provided, however,* That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural-gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural-gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

(b) The Commission upon its own motion, or upon the request of any State commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production or transportation of natural gas by a natural-gas company in cases where the Commission has no authority to establish a rate governing the transportation or sale of such natural gas. [52 Stat. 823 (1938); 15 U.S.C. § 717d]

Administration Powers of Commission; Rules, Regulations, and Orders

Sec. 16. The Commission shall have power to perform any and all acts, and to prescribe, issue, make, amend, and rescind such orders, rules and regulations as it may find necessary or appropriate to carry out the provisions of this act. Among other things, such rules and regulations may define accounting, technical, and trade terms used in this act; and may prescribe the form or forms of all statements, declarations, applications, and reports to be filed with the Commission, the information which they shall contain, and the time within which they shall be filed. Unless a different date is specified therein, rules and regulations of the Commission shall be effective thirty days after publication in the manner which the Commission shall prescribe. Orders of the Commission shall be effective on the date and in the manner which the Commission shall prescribe. For the purposes of its rules and regulations, the Commission may classify persons and matters within its jurisdiction and prescribe different requirements for different classes of persons or matters. All rules and regulations of the Commission shall be filed with its secretary and shall be kept open in convenient form for public inspection and examination during reasonable business hours. [52 Stat. 830 (1938); 15 U.S.C. § 717o]

Rehearing; Court Review Of Orders

Sec. 19. (a) Any person, State, municipality, or State commission aggrieved by an order issued by the Commission in a proceeding under this act to which such

person, State, municipality, or State commission is a party may apply for a rehearing within thirty days after the issuance of such order. The application for rehearing shall set forth specifically the ground or grounds upon which such application is based. Upon such application the Commission shall have power to grant or deny rehearing or to abrogate or modify its order without further hearing. Unless the Commission acts upon the application for rehearing within thirty days after it is filed, such application may be deemed to have been denied. No proceeding to review any order of the Commission shall be brought by any person unless such person shall have made application to the Commission for a rehearing thereon. Until the record in a proceeding shall have been filed in a court of appeals, as provided in subsection (b), the Commission may at any time, upon reasonable notice and in such manner as it shall deem proper, modify or set aside, in whole or in part, any finding or order made or issued by it under the provisions of this Act.

(b) Any party to a proceeding under this act aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business, or in the United States Court of Appeals for the District of Columbia, by filing in such court, within sixty days after the order of the Commission upon the application for rehearing, a written petition praying that the order of the Commission be modified or set aside in whole or in part. A copy of such petition shall

forthwith be transmitted by the clerk of the court to any member of the Commission and thereupon the Commission shall file with the court the record upon which the order complained of was entered, as provided in section 2112 of title 28, United States Code. Upon the filing of such petition such court shall have jurisdiction, which upon the filing of the record with it shall be exclusive, to affirm, modify, or set aside such order in whole or in part. No objection to the order of the Commission shall be considered by the court unless such objection shall have been urged before the Commission in the application for rehearing unless there is reasonable ground for failure so to do. The finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. If any party shall apply to the court for leave to adduce additional evidence, and shall show to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for failure to adduce such evidence in the proceedings before the Commission, the court may order such additional evidence to be taken before the Commission and to be adduced upon the hearing in such manner and upon such terms and conditions as to the court may seem proper. The Commission may modify its findings as to the facts by reason of the additional evidence so taken, and it shall file with the court such modified or new findings, which if supported by substantial evidence, shall be conclusive, and its recommendation, if any, for the modification or setting aside of the original order. The judgment and decree of the court, affirming, modifying, or setting aside, in whole or in part, any such order of the Commission, shall be final, subject to review by the Supreme Court of

the United States upon certiorari or certification as provided in [former] sections 239 and 240 of the Judicial Code, as amended (U.S.C., title 28, sec. 1254).

(c) The filing of an application for rehearing under subsection (a) shall not, unless specifically ordered by the Commission, operate as a stay of the Commission's order. The commencement of proceedings under subsection (b) of this section shall not, unless specifically ordered by the court, operate as a stay of the Commission's order. [52 Stat. 831 (1938); 15 U.S.C. § 717r]

MOTION FOR LEAVE TO FILE SUPPLEMENT TO PETITION FOR WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

Petitioners, Pacific Gas and Electric Company, Pacific Lighting Service and Supply Company, San Diego Gas & Electric Company, Southern California Gas Company, and Southern Counties Gas Company of California, pursuant to Rule 35 of the Revised Rules of this Court, respectfully move for leave to file a supplement to their Petition for a Writ of Certiorari to the United States Court of Appeals for the Tenth Circuit, which was filed with this Court on April 19, 1967.

The Petition for a Writ of Certiorari previously filed by Petitioners raised certain questions with respect to the

Court of Appeals' opinion in *Skelly Oil Co. v. F.P.C.*, ... F.2d ..... (10th Cir., 1967). The opinion and judgment of that court was issued on January 20, 1967, and the last date to file petitions for certiorari was, therefore, April 20, 1967. Petitioners, therefore, timely filed for their Petition for a Writ of Certiorari.

Between March 6 and March 10, 1967, a number of natural gas producer respondents[1] to the Commission's opinion below petitioned the Court of Appeals for rehearing on a limited number of issues. On April 18, 1967, the Court of Appeals issued an opinion on rehearing which now raises two additional questions of great significance. This opinion was issued after Petitioners had printed their Petition for a Writ of Certiorari and Petitioners were, therefore, unable to include these new vital matters in their petition filed on April 19, 1967.

by /s/ JOHN ORMASA
JOHN ORMASA

In their petitions for rehearing to the Court of Appeals, certain respondent producers[1] raised, along with others, two issues, one which the Court of Appeals had apparently overlooked and another on which it had sustained the Commission.

On April 18, 1967, in response to said petitions for rehearing the Court of Appeals issued an opinion on these two issues.[2]

The additional questions presented *infra* which we seek to have reviewed by this Supplement to our Petition for Certiorari encompass these two issues.

CITATIONS TO ADDITIONAL OPINIONS BELOW

The opinion of the Court of Appeals on rehearing is as yet unreported and is printed in Appendix A hereto, beginning at page 10.

ADDITIONAL QUESTIONS PRESENTED

1. Can the Federal Power Commission in a Natural Gas Act Section 7 (15 U.S.C. § 717f) initial certificate proceeding involving producer rates adopt as the in-line rate its most recently determined applicable just and reasonable area rate?

---

[1] These parties are noted in the footnote appearing at page 2.

[2] The judgments issued by the Court of Appeals in all of the petitions for review were in the same form. The one contained in Superior Oil Company's Petition for Writ of Certiorari (No. 1287) is typical. No new judgments were issued following the opinion on rehearing.

2. Can the Commission in an area rate order require individual producers to refund rates in effect subject to refund to the extent that they exceed the applicable area rate?

ADDITIONAL STATUTE INVOLVED

The additional statutory provision involved is Section 7 of the Natural Gas Act (15 U.S.C. § 717f). It is printed in Appendix B hereto, beginning at page 12.

ADDITIONAL REASONS FOR GRANTING THE WRIT

1. The Federal Power Commission Should Be Required to Apply as an In-Line Rate a Rate Recently Determined to Be the Just and Reasonable Rate.

The court below in its opinion on rehearing refused to decide whether an area rate established after extensive hearings automatically becomes the in-line rate in a Natural Gas Act Section 7 (15 U.S.C. § 717f) proceeding because it rejected the area rate. A decision on this issue is essential to the orderly administration of producer regulation under the Natural Gas Act.

If the Commission is unable to apply the area rate determined in proceedings under Sections 4 (15 U.S.C. §717c) and 5 (15 U.S.C. § 717d) of the Natural Gas Act as the rate for new sales authorized under Section 7, the painstaking and timely effort involved in area rate-making will have little prospective application to new supplies sold in interstate commerce. By not applying the area rate as the in-line rate, Section 7 proceedings would become a sieve through which excessive prices will be

certificated for new gas until another area rate proceeding is determined. Common sense itself dictates any rate in excess of the area rate is "suspect" and therefore an invalid basis for an in-line determination. The only nonsuspect price is the area rate and it must therefore be the in-line price. It is, therefore, imperative and appropriate that the area rate determined in a Section 4 and Section 5 proceeding be used as the in-line rate for a reasonable period of time thereafter if the consumer is to be afforded needed protection under the Natural Gas Act. (*Atlantic Ref. Co. v. Pub. Serv. Com. of New York*, 360 U.S. 378 (1959).)

2. The Only Appropriate Refund Method is a Company-By-Company and Rate Schedule-By-Rate Schedule Method.

On rehearing the Court of Appeals reversed itself on the issue of the computation of refunds. In its prior opinion, the court below agreed with the Commission that refunds should be ordered on a company-by-company and rate schedule-by-rate schedule basis. In doing so, it stated:

> "We see no escape from the requirement that refunds be on a company-by-company basis and on a schedule-by-schedule basis."[3]

It now states, however, on rehearing that:

> "This modification of the opinion means that no refund obligation may be imposed for a period in which there is a group revenue deficiency. When group revenues exceed group revenue requirements,

[3] Appendices to Petition for Writ of Certiorari pp. 426-427.

refunds may be ordered on some equitable contract-by-contract basis. In fixing an area rate, the Commission must consider the effect which past and potential refunds have on the balancing of group revenues with group revenue requirements."[4]

The examiner fell into the same error in his decision. The Commission corrected the error with the following comment:

> "Several fundamental objections preclude adoption of the examiner's proposed method of computing refunds. We think it would result in inequities among wholesale customers as well as among individual producers. If one wholesale customer has been overcharged it is of little comfort to him to know that another customer has received a bargain. Conversely, if one producer has collected excessive amounts, he should not be relieved of his responsibility to return the excess by reason of the fact that some other producer collected too little. Furthermore, the administrative difficulties involved in attempting for each year, and each category of sales, to equate industry revenues with industry expenditures, and to allocate the excess revenues among the purchasers, seem almost insurmountable." (Opinion No. 468, 34 FPC 159, 232-234 (1965), JA 277, 689)

The Commission's refund order based on its sound administrative expertise, as evidenced by the above quotation, produces a fair and just result to consumer

---

and producer alike and conforms to the very purpose of the Natural Gas Act.

CONCLUSION

In order to correct all the errors made by the Court of Appeals in its decision, it is necessary to review the two new issues raised by the Court of Appeals' opinion on rehearing. We, therefore, respectfully urge this Court to grant our previously filed Petition for a Writ of Certiorari as augmented by this Supplement.

APPENDIX A

United States Court of Appeals
TENTH CIRCUIT

Nos. 8385 etc., MARCH TERM, 1967

SKELLY OIL COMPANY, et al.,
Petitioners,
v.
FEDERAL POWER COMMISSION,
Respondent.

FILED
UNITED STATES
COURT OF APPEALS
TENTH CIRCUIT
APR 18, 1967
WILLIAM L. WHITTAKER
CLERK

ON REHEARING.
PER CURIAM.

Texaco Inc. asserts that the opinion is not clear as to the disposition of its Docket No. C161-879 in which, by an order separate and apart from Opinions Nos. 468 and 468-A and their accompanying orders, a § 7 certificate was issued at a rate of 14.5 cents less quality deductions. This separate order shows that the Commission treated the area rate as the in-line rate for § 7 certificates.

The order on this docket was lost in the mass of material presented to us. No party made a point of it. We have reconsidered the Texaco petition for review and have concluded that it is sufficiently broad to cover such order. It should receive the same treatment as the § 4 and § 5 proceedings. Accordingly, the remand in-

CARD 27

cludes the separate order entered in Docket No. C161-879.

We note that in its disposition of this particular docket the Commission took the position that an established area rate automatically becomes the in-line rate for a § 7 proceeding. The same position was taken by the Commission in its Opinion No. 484 which we are today reversing by our decision in Nos. 8723 etc. — Phillips Petroleum Company, et al., v. Federal Power Commission, ... F.2d ..... We there hold that in a § 7 application heard by the Commission after its Permian decision the adoption of the area rate as an in-line rate must fall because we have rejected the area rate. We do not there, and we do not here, express either approval or disapproval of the principle that an area rate established in a § 5 proceeding automatically becomes an in-line rate for a § 7 proceeding. The validity of such a principle may be affected by the final determination of the validity of the Permian Basin area rate.

Various producers insist that we erred in our treatment of refunds. We held that refunds must be on a company-by-company and schedule-by-schedule basis. We are now convinced that such holding was wrong and is inconsistent with our conclusion that satisfaction of the end result test requires rates which will equate group revenues with group revenue requirements.

The refunds in question relate to collections made during the so-called "locked-in" periods, i.e., the periods during which an increased rate, later superseded by a further increase, is effective. See Second Phillips, 373 U.S. 294, 298, fn. 5. In that case the Court said that

on the locked-in rate issue "the sole question was whether all or any part of the increases had to be refunded by Phillips." The Court pointed out that the Commission decided that the increases did not bring revenues up to cost of service, and held that the Commission "properly concluded" that "no refund obligations could be imposed." *Id.* at 306.

We are now convinced that this treatment of refund obligations for locked-in rates in the case of an individual company in Second Phillips must be applied on a group basis when an area rate is fixed and tested by the end result. We are also convinced that our reliance on Federal Power Commission v. Tennessee Gas Transmission Co., 371 U.S. 145, was misplaced. That case dealt with zone rates. The Second Phillips decision on locked-in rates came later.

This modification of the opinion means that no refund obligation may be imposed for a period in which there is a group revenue deficiency. When group revenues exceed group revenue requirements, refunds may be ordered on some equitable contract-by-contract basis. In fixing an area rate, the Commission must consider the effect which past and potential refunds have on the balancing of group revenues with group revenue requirements.

In all respects, except those specifically noted herein, the petitions for rehearing are severally denied.

APPENDIX

APPENDIX B

NATURAL GAS ACT
EXTENSION OF FACILITIES; ABANDONMENT OF SERVICE

Sec. 7. (a) Whenever the Commission, after notice and opportunity for hearing, finds such action necessary or desirable in the public interest, it may by order direct a natural-gas company to extend or improve its transportation facilities, to establish physical connection of its transportation facilities with the facilities of, and sell natural gas to, any person or municipality engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public, and for such purpose to extend its transportation facilities to communities immediately adjacent to such facilities or to territory served by such natural-gas company, if the Commission finds that no undue burden will be placed upon such natural-gas company thereby: *Provided,* That the Commission shall have no authority to compel the enlargement of transportation facilities for such purposes, or to compel such natural-gas company to establish physical connection or sell natural gas when to do so would impair its ability to render adequate service to its customers. [52 Stat. 824 (1938); 15 U.S.C. §717f (a)]

(b) No natural-gas company shall abandon all or any portion of its facilities subject to the jurisdiction of the Commission, or any service rendered by means of such facilities, without the permission and approval of the Commission first had and obtained, after due hearing, and a finding by the Commission that the available supply of natural gas is depleted to the extent that the con-

tinuance of service is unwarranted, or that the present or future public convenience or necessity permit such abandonment. [52 Stat. 824 (1938); 15 U.S.C. §717f (b)]

(c) No natural-gas company or person which will be a natural-gas company upon completion of any proposed construction or extension shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission, or undertake the construction or extension of any facilities therefor, or acquire or operate any such facilities or extensions thereof, unless there is in force with respect to such natural-gas company a certificate of public convenience and necessity issued by the Commission authorizing such acts or operations: *Provided, however,* That if any such natural-gas company or predecessor in interest was bona fide engaged in transportation or sale of natural gas, subject to the jurisdiction of the Commission, on the effective date of this amendatory Act, over the route or routes or within the area for which application is made and has so operated since that time, the Commission shall issue such certificate without requiring further proof that public convenience and necessity will be served by such operation, and without further proceedings, if application for such certificate is made to the Commission within ninety days after the effective date of this amendatory Act. Pending the determination of any such application, the continuance of such operation shall be lawful.

In all other cases the Commission shall set the matter for hearing and shall give such reasonable notice of the hearing thereon to all interested persons as in its judgment may be necessary under rules and regulations

to be prescribed by the Commission; and the application shall be decided in accordance with the procedure provided in subsection (e) of this section and such certificate shall be issued or denied accordingly: *Provided, however,* That the Commission may issue a temporary certificate in cases of emergency, to assure maintenance of adequate service or to serve particular customers, without notice or hearing, pending the determination of an application for a certificate, and may by regulation exempt from the requirements of this section temporary acts or operations for which the issuance of a certificate will not be required in the public interest. [52 Stat. 825 (1938), as amended, 56 Stat. 83 (1942); 15 U.S.C. § 717f (c)]

(d) Application for certificates shall be made in writing to the Commission, be verified under oath, and shall be in such form, contain such information, and notice thereof shall be served upon such interested parties and in such manner as the Commission shall, by regulation, require. [56 Stat. 84 (1942); 15 U.S.C. § 717f (d)]

(e) Except in the cases governed by the provisos contained in subsection (c) of this section, a certificate shall be issued to any qualified applicant therefor, authorizing the whole or any part of the operation, sale, service, construction, extension, or acquisition covered by the application, if it is found that the applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Act and the requirements, rules, and regulations of the Commission thereunder, and that the proposed service, sale, operation, construction, extension, or acquisition, to the extent authorized by the certificate, is or will be required

by the present or future public convenience and necessity; otherwise such application shall be denied. The Commission shall have the power to attach to the issuance of the certificate and to the exercise of the rights granted thereunder such reasonable terms and conditions as the public convenience and necessity may require. [56 Stat. 84 (1942); 15 U.S.C. § 717f (e)]

(f) The Commission, after a hearing had upon its own motion or upon application, may determine the service area to which each authorization under this section is to be limited. Within such service area as determined by the Commission a natural-gas company may enlarge or extend its facilities for the purpose of supplying increased market demands in such service area without further authorization. [56 Stat. 84 (1942); 15 U.S.C. § 717f(f)]

(g) Nothing contained in this section shall be construed as a limitation upon the power of the Commission to grant certificates of public convenience and necessity for service of an area already being served by another natural-gas company. [56 Stat. 84 (1942); 15 U.S.C. § 717f(g)]

(h) When any holder of a certificate of public convenience and necessity cannot acquire by contract, or is unable to agree with the owner of property to the compensation to be paid for, the necessary right-of-way to construct, operate, and maintain a pipe line or pipe lines for the transportation of natural gas, and the necessary land or other property, in addition to right-of-way, for the location of compressor stations, pressure apparatus, or other stations or equipment necessary to the proper

operation of such pipe line or pipe lines, it may acquire the same by the exercise of the right of eminent domain in the district court of the United States for the district in which such property may be located, or in the State courts. The practice and procedure in any action or proceeding for that purpose in the district court of the United States shall conform as nearly as may be with the practice and procedure in similar action or proceeding in the courts of the State where the property is situated: *Provided*, That the United States district courts shall only have jurisdiction of cases when the amount claimed by the owner of the property to be condemned exceeds $3,000. [61 Stat. 459 (1947); 15 U. S. C. § 717f(h)]

PETITION FOR WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE TENTH CIRCUIT

Petitioners, Perry R. Bass, Panther City Investment Co., Bass Bros. Enterprises, Inc., Perry R. Bass, Incorporated, and Richardson Oils, Inc., pray that a Writ of Certiorari issue to review the judgment of the United States Court of Appeals for the Tenth Circuit in this case entered on January 20, 1967.

OPINION BELOW

The opinion of the Court of Appeals for the Tenth Circuit in *Skelly Oil Company* v. *Federal Power Commission*

is not yet officially reported.[1] The orders of the Federal Power Commission are reported at 34 FPC 159, 1068, 1082 and 1198.

JURISDICTION

The judgment of the Court of Appeals was entered January 20, 1967. Jurisdiction of this Court is invoked under 28 U.S.C. § 1254(1) and section 19(b) of the Natural Gas Act, 15 U.S.C. § 717r(b).

STATUTE INVOLVED

The Natural Gas Act, June 21, 1938 c. 556, 52 Stat. 821-833, as amended, 15 U.S.C. § 717-717w, provides in pertinent part as follows:

Section 5(a), 15 U.S.C. § 717d(a):

> Whenever the Commission, after a hearing, * * * shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: * * *

---

[1] Printed copies of this opinion will be submitted with the petitions for certiorari which Petitioners understand are concurrently being filed by the Federal Power Commission and other parties to the proceedings in the court below. Accordingly, Petitioners have not included said opinion as an appendix to this petition.

QUESTIONS PRESENTED

1. Whether, in reviewing prices charged by natural gas producers under section 5(a) of the Natural Gas Act, the Commission may determine that a permanently certificated price is unjust or unreasonable without considering proffered evidence of, or making allowance for, (1) special services rendered in connection with a particular sale and (2) the revenue requirements of the individual producers involved.

2. Whether, in determining just and reasonable area prices under section 5(a) of the Natural Gas Act, the Commission erred in failing to include an allowance for gathering and processing costs actually incurred by producers.

3. Whether, in determining just and reasonable area prices, the Commission erred in failing to give the parties notice that quality standards were at issue and that the area prices established would be reduced by an undetermined amount for gas which did not meet such quality standards.

4. Whether, in relying solely upon its determination of the average cost of *gas-well gas,* produced by a group of major companies in the Permian Basin area of West Texas and New Mexico during the year 1960, the Federal Power Commission sustained its burden of proof under section 5(a) of the Natural Gas Act of showing by substantial evidence and soundly based findings that Petitioners' permanently certificated 18¢ per Mcf price for sales of *residue gas* was unjust or unreasonable and that the just and reasonable price for such sales for 1966 and future years was 14.5¢ per Mcf less an undetermined reduction for gas which did not meet quality standards prescribed by the Commission.

STATEMENT OF THE CASE

In its first *Phillips* decision,[2] this Court directed the Commission to regulate the prices charged by natural gas producers making sales in interstate commerce. Subsequently, Petitioners sought Commission certification of a proposed sale of residue gas to Transwestern Pipeline Company under contract dated July 9, 1958. Because of the many premium services (including extensive gathering, processing and compression) offered by Petitioners, the Commission certificated this sale at a price of 18¢ per Mcf[3] (22 F.P.C. 39). In supplemental proceedings, the Commission again determined (28 F.P.C. 109) that the public interest price for this sale to Transwestern was 18¢ per Mcf. This price was 2¢ above the 16¢ per Mcf price that the Commission had adopted as the area guideline price (24 F.P.C. 818).

In its second *Phillips* decision,[4] this Court sustained the Commission's determination to regulate producer prices on an area basis. However, the Court made it clear that it was not passing upon the lawfulness of the Commission's implementation of area pricing:

> "The lawfulness of the area pricing methods are not themselves before the court for review." 373 U.S. at 308.

The Commission's first attempt at implementing area prices was directed to the Permian Basin area of West Texas and New Mexico. In the orders under review the Commission established two just and reasonable ceiling prices for inter-

---

[2] *Phillips Petroleum Co.* v. *Wisconsin,* 347 U.S. 672 (1954).

[3] The Commission concurrently certificated other sales of gas to Transwestern at 16¢ per Mcf, thus recognizing the 2¢ per Mcf additional value of the premium services to be performed by Petitioners.

[4] *Wisconsin* v. *FPC,* 373 U.S. 294 (1963).

state sales of gas from this area. It found all prices in excess of such ceiling to be unjust and unreasonable and ordered that any higher prices be reduced to the applicable ceiling effective September 1, 1965. The Commission set a ceiling price of 16.5¢ per Mcf for gas-well gas (and residue gas derived therefrom) sold under contracts executed on or after January 1, 1961; as to all other sales of gas the Commission set a ceiling price of 14.5¢ per Mcf. These ceiling prices were based upon the Commission's determinations of the average cost of gas-well gas on an area and nationwide basis produced by a group of major producers during the year 1960. The allowance for gathering or processing costs actually incurred by Petitioners and other producers was not included in such composite cost determinations. Without notice,[5] the Commission simultaneously determined quality standards and provided that its ceiling prices should be reduced by an undetermined amount if gas did not meet such quality standards.

On the basis of its composite average area cost determination, the Commission found that Petitioners' 18¢ price for *residue gas* sold to Transwestern was unjust and unreasonable and that the just and reasonable price for such sale for 1966 and future years was 14.5¢ per Mcf less the undetermined quality deduction. As a result, Petitioners sustained the largest single reduction of any permanently certificated price in the Permian Basin area. The Commission refused to consider evidence of the unique premium services rendered by Petitioners despite the fact that on two previous occasions the existence of these unique fea-

[5] During the hearings the Commission denied a producer motion requesting that a pending rule-making proceeding involving the establishment of quality standards be consolidated with this area-rate proceeding. When the Commission denied this motion, efforts to present evidence on the issue of quality standards were abandoned by the producers and eventually by the staff of the Commission.

tures had prompted the Commission to certificate Petitioners' sales at prices that were 2¢ per Mcf higher than the area guideline price. It also rejected evidence offered to show that an 18¢ price was just and reasonable in light of Petitioners' revenue requirements.

Petitioners and other producers sought review of the Commissioner's orders in the United States Court of Appeals for the Tenth Circuit.[6] On January 20, 1967, that court reversed and remanded the Commission's orders for further proceedings because "the actions of the Commission do not comply with the end result test established in *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U.S. 591, 602-603, and other decisions."[7] However, the court either impliedly or expressly denied Petitioners' points of error relating to each of the questions presented herein.

STATEMENT OF POSITION AND CONDITIONS FOR GRANTING THE WRIT

1.

Petitioners believe that all petitions for writs of certiorari in this case should be denied and that further proceedings should be held by the Federal Power Commission consistent with the opinion of the court below. The Tenth Circuit sustained the Commission's power to determine just and reasonable rates pursuant to sections 4 and 5 of the Natural Gas Act on a group or area basis rather than on an individual producer basis. The court also rejected many

---

[6] Petitioners' appeal was docketed as No. 8511 in the Court of Appeals.

[7] In *Colorado Interstate Gas Co.* v. *FPC*, 324 U.S. 581, 605 (1945), this Court stated:

> "In those cases we held that the question for the courts when a rate order is challenged is whether the order viewed in its entirety and measured by its end results meets the requirements of the Act."

of the other attacks made on the Commissioner's area rate determination, including those raised herein by Petitioners. However, the court held that the case should be remanded because the Commission failed to determine the financial impact of the quality deductions and thereby made it impossible to determine "whether the proper revenue requirements of the area producers as a group can be satisfied with rates having the ceiling and floor which the Commission fixed."[8] The court also held that the provisions in the Commission's orders for special relief from the area rates was insufficient and unsatisfactory. Accordingly, the court below directed the Commission "to hold such additional hearings as are needed to determine the effect of the quality adjustments, and to determine the group revenues and group revenue requirements," to make findings thereon, and to issue an order containing an adequate provision for special relief.

When these subsequent determinations are made by the Commission, many of the questions now raised by Petitioners and other may no longer exist.[9] On the other hand, should the Commission's decision again adversely affect any party, he will still be in a position to challenge the Commission's area rate determinations, including the power

---

[8] The court below deferred passing on the producers' contention that the quality standards prescribed by the Commission violated procedural due process because of lack of notice. The court assumed that this defect, if there was one, would be cured by the remanded proceedings where everyone would have notice. It also requested the Commission to clarify the reasons for its price adjustment based on the BTU content of the gas.

[9] For example, as suggested by the court below, the special relief clause may provide producers with an allowance for actual costs incurred in connection with furnishing gathering facilities. Also, the argument that the imposition of quality standards violates procedural due process because of lack of notice will be rendered moot.

of the Commission to set area rates.[10] In any event, when the Commission has determined the jurisdictional revenues which its area rates will produce and made the other findings required by the court below, this Court will be able to appraise more realistically and intelligently the validity of the Commission's area rate determinations.

2.

The importance of this case to the administration of the Natural Gas Act is self-evident. It is the logical sequel to this Court's first and second *Phillips* decisions.[11] Having determined that the Federal Power Commission must regulate prices charged by producers for interstate sales of natural gas and that regulation on an area basis can be lawful, this Court is now requested to pass upon the lawfulness of the Commission's initial attempt to set area rates.

As stated above, Petitioners believe that there is no occasion for the Court to review this case at the present stage of the proceedings. However, should the Court grant certiorari in response to the petitions filed by the Federal Power Commission or any of the other parties, Petitioners submit that the points of error and arguments of all parties with respect to the opinion of the court below should be before the Court for simultaneous review. The case below involved many complex questions. Review of only a few of these questions would be incomplete and would not permit this Court to decide adequately the basic questions relating to area pricing methods. In this connection, Petitioners point out that in the court below they were the principal

[10] *Hamilton-Brown Shoe Co.* v. *Wolf Brothers & Co.*, 240 U.S. 251, 257-58 (1916); see also *Urie* v. *Thompson*, 337 U.S. 163, 172-73 (1949); *United States* v. *United States Smelting Refining & Mining Co.*, 339 U.S. 186, 198-99 (1950); Stern and Gressman, *Supreme Court Practice* § 2-2 (3d ed. 1962).

[11] Footnotes 2 and 4, *supra*.

proponents of the questions presented herein. Although these questions are predicated upon facts related to Petitioners' sales of residue gas, they have general applicability to other similarly situated producers in the Permian Basin area. Therefore, the granting of this petition will bring before the Court questions which are of vital importance to the establishment of just and reasonable area prices by the Commission.

CONCLUSION

For the foregoing reasons, this Petition for Writ of Certiorari should be granted in the event the Court determines to grant other concurrently filed petitions.
